a. Exposed person has not been vaccinated or has not completed vaccination. Hepatitis B vaccination should be initiated. A single dose of HBIG (0.06 ml/kg) should be given as soon as possible after exposure and within 24 hours, if possible. The first dose of hepatitis B vaccine (Table 1) should be given intramuscularly at a separate site (deltoid for adults) and can be given simultaneously with HBIG or within 7 days of exposure. Subsequent doses should be given as recommended for the specific vaccine. If the exposed person has begun but not completed vaccination, one dose of HBIG should be given immediately, and vaccination should be completed as scheduled.

b. Exposed person has already been vaccinated against hepatitis B, and anti-HBs response status is known.

(1) If the exposed person is known to have had adequate response in the past, the anti-HBs level should be tested unless an adequate level has been demonstrated within the last 24 months. Although current data show that vaccine-induced protection does not decrease as antibody level wanes, most experts consider the following approach to be prudent.

a) If anti-HBs level is adequate ($\geq$10 mIU/ml), no treatment is necessary.

b) If anti-HBs level is inadequate, a booster dose of hepatitis B vaccine should be given.

(2) If the exposed person is known not to have responded to the primary vaccine series, the exposed person should be given either a single dose of HBIG and a dose of hepatitis B vaccine as soon as possible after exposure, or two doses of HBIG (0.06 ml/kg), one given as soon as possible after exposure and the second 1 month later. The latter treatment is preferred for those who have failed to respond to at least four doses of vaccine.

c. Exposed person has already been vaccinated against hepatitis B and the anti-HBs response is unknown. The exposed person should be tested for anti-HBs.

(1) If the exposed person has adequate antibody, no additional treatment is necessary.

(2) If the exposed person has inadequate antibody on testing, one dose of HBIG (0.06 ml/kg) should be given immediately and a standard booster dose of vaccine (Table 1) given at a different site.

2. Source of exposure known and HBsAg-negative

a. Exposed person has not been vaccinated or has not completed vaccination. If unvaccinated, the exposed person should be given the first dose of hepatitis B vaccine within 7 days of exposure, and vaccination should be completed as recommended. If the exposed person has not completed vaccination, vaccination should be completed as scheduled.

b. Exposed person has already been vaccinated against hepatitis B. No treatment is necessary.

3. Source of exposure unknown or not available for testing

a. Exposed person has not been vaccinated or has not completed vaccination. If unvaccinated, the exposed person should be given the first dose of hepatitis B vaccine within 7 days of exposure and vaccination completed as

TABLE 3. Recommendations for hepatitis B prophylaxis following percutaneous or permucosal exposure

	Treatment when source is found to be:		
Exposed person	**HBsAg-positive**	**HBsAg-negative**	**Source not tested or unknown**
Unvaccinated	HBIG x 1* and initiate HB vaccine†	Initiate HB vaccine†	Initiate HB vaccine†
Previously vaccinated Known responder	Test exposed for anti-HBs 1. If adequate,§ no treatment 2. If inadequate, HB vaccine booster dose	No treatment	No treatment
Known nonresponder	HBIG x 2 or HBIG x 1 plus 1 dose HB vaccine	No treatment	If known high-risk source, *may treat as if source were HBsAg-positive*
Response unknown	Test exposed for anti-HBs 1. if inadequate,§ HBIG x 1 plus HB vaccine booster dose 2. If adequate, no treatment	No treatment	Test exposed for anti-HBs 1. If inadequate§, HB vaccine booster dose 2. If adequate, no treatment

*HBIG dose 0.06 ml/kg IM.
†HB vaccine dose - see Table 3.
§Adequate anti-HBs is ≥10 SRU by RIA or positive by EIA.

recommended. If the exposed person has not completed vaccination, vaccination should be completed as scheduled.

b. Exposed person has already been vaccinated against hepatitis B, and anti-HBs response status is known.

(1) If the exposed person is known to have had adequate response in the past, no treatment is necessary.

(2) If the exposed person is known not to have responded to the vaccine, prophylaxis as described earlier in section 1.b.(2) under "Source of exposure HBsAg-positive" may be considered if the source of the exposure is known to be at high risk of HBV infection.

c. Exposed person has already been vaccinated against hepatitis B, and the anti-HBs response is unknown. The exposed person should be tested for anti-HBs.

(1) If the exposed person has adequate anti-HBs, no treatment is necessary.

(2) If the exposed person has inadequate anti-HBs, a standard booster dose of vaccine should be given.

Sexual Partners of Persons with Acute HBV Infection

Sexual partners of HBsAg-positive persons are at increased risk of acquiring HBV infection, and HBIG has been shown to be 75% effective in preventing such infections. Because data are limited, the period after sexual exposure during which HBIG is effective is unknown, but extrapolation from other settings makes it unlikely that this period would exceed 14 days. Before treatment, testing of sexual partners for susceptibility is recommended if it does not delay treatment beyond 14 days after last exposure. Testing for anti-HBc is the most efficient prescreening test to use in this population.

All susceptible persons whose sexual partners have acute hepatitis B infection or whose sexual partners are discovered to be hepatitis B carriers should receive a single dose of HBIG (0.06 ml/kg) and should begin the hepatitis B vaccine series if prophylaxis can be started within 14 days of the last sexual contact, or if ongoing sexual contact with the infected person will occur. Giving the vaccine with HBIG may improve the efficacy of postexposure treatment. The vaccine has the added advantage of conferring long-lasting protection.

An alternative treatment for persons who are not from a high-risk group for whom vaccine is routinely recommended and whose regular sexual partners have acute HBV infection is to give one dose of HBIG (without vaccine) and retest the sexual partner for HBsAg 3 months later. No further treatment is necessary if the sexual partner becomes HBsAg-negative. If the sexual partner remains HBsAg-positive, a second dose of HBIG should be given and the hepatitis B vaccine series started.

Household Contacts of Persons with Acute HBV Infection

Since infants have close contact with primary care givers and they have a higher risk of becoming HBV carriers after acute HBV infection, prophylaxis of an infant < 12 months of age with HBIG (0.5 ml) and hepatitis B vaccine is indicated if the mother or primary care giver has acute HBV infection. Prophylaxis for other household contacts of persons with acute HBV infection is not indicated unless they have had identifiable blood exposure to the index patient, such as by sharing toothbrushes or razors. Such exposures should be treated similarly to sexual exposures. If the index patient becomes an HBV carrier, all household contacts should be given hepatitis B vaccine.

CDC VIRAL HEPATITIS HOTLINE

For the purpose of disseminating comprehensive information on viral hepatitis, the CDC has established a "hotline" number---(404) 332-4555. Please use this number and provide this number to any interested persons.

THERAPY THAT MAY BE AS SILENT AS HYPERTENSION ITSELF

VASOTEC is generally well tolerated and not characterized by certain undesirable effects associated with selected agents in other antihypertensive classes.

VASOTEC is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

A diminished antihypertensive effect toward the end of the dosing interval can occur in some patients.

For a Brief Summary of Prescribing Information, please see the last page of this advertisement.

FOR MANY HYPERTENSIVE PATIENTS
ONCE-A-DAY

VASOTEC®
(ENALAPRIL MALEATE | MSD)

Copyright © 1990 by Merck & Co., Inc.

VASOTEC®

(ENALAPRIL MALEATE | MSD)

VASOTEC is available in 2.5-mg, 5-mg, 10-mg, and 20-mg tablet strengths.

Contraindications: VASOTEC® (Enalapril Maleate, MSD) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the face, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASOTEC. In such cases, VASOTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See ADVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Patients with heart failure given VASOTEC commonly have some reduction in blood pressure, especially with the first dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are followed; caution should be observed when initiating therapy. (See DOSAGE AND ADMINISTRATION.) Patients at risk for excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion of any etiology. It may be advisable to eliminate the diuretic (except in patients with heart failure), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASOTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIONS, *Drug Interactions* and ADVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident. If excessive hypotension occurs, the patient should be placed in the supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses of VASOTEC, which usually can be given without difficulty once the blood pressure has stabilized. If symptomatic hypotension develops, a dose reduction or discontinuation of VASOTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASOTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of the diuretic and/or VASOTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See DOSAGE AND ADMINISTRATION.)

Hyperkalemia: Elevated serum potassium (>5.7 mEq/L) was observed in approximately 1% of hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause of discontinuation of therapy in 0.28% of hypertensive patients. In clinical trials in heart failure, hyperkalemia was observed in 3.8% of patients, but was not a cause for discontinuation.

Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with VASOTEC. (See *Drug Interactions.*)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness, especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision after the initial dose for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and DOSAGE AND ADMINISTRATION.)

Agents Causing Renin Release: The antihypertensive effect of VASOTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia, they should be used with caution and with frequent monitoring of serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: Lithium toxicity has been reported in patients receiving lithium concomitantly with drugs which cause elimination of sodium, including ACE inhibitors. A few cases of lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation of both drugs. It is recommended that serum lithium levels be monitored frequently if enalapril is administered concomitantly with lithium.

Pregnancy – Category C: There was no tetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average fetal weight, occurred in rats given 1200 mg/kg/day of enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and fetal toxicity occurred in some rabbits at doses of 1 mg/kg/day or more. Saline supplementation prevented the maternal and fetal toxicity seen at doses of 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies of enalapril in pregnant women. However, data are available that show enalapril crosses the human placenta. Because the risk of fetal toxicity with the use of ACE inhibitors has not been clearly defined, VASOTEC® (Enalapril Maleate, MSD) should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Postmarketing experience with all ACE inhibitors thus far suggests the following with regard to pregnancy outcome. Inadvertent exposure limited to the first trimester of pregnancy has not been reported to affect fetal outcome adversely. Fetal exposure during the second and third trimesters of pregnancy has been associated with fetal and neonatal morbidity and mortality.

When ACE inhibitors are used during the later stages of pregnancy, there have been reports of hypotension and decreased renal perfusion in the newborn. Oligohydramnios in the mother has also been reported, presumably representing decreased renal function in the fetus. Infants exposed *in utero* to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion with the administration of fluids and pressors as appropriate. Problems associated with prematurity such as patent ductus arteriosus have occurred in association with maternal use of ACE inhibitors, but it is not clear whether they are related to ACE inhibition, maternal hypertension, or the underlying prematurity.

Nursing Mothers: Milk in lactating rats contains radioactivity following administration of ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Safety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for safety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASOTEC has been found to be generally well tolerated in controlled clinical trials involving 2987 patients.

HYPERTENSION: The most frequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

HEART FAILURE: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (7.9%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial infarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% of patients with hypertension or heart failure in clinical trials in order of decreasing severity within each category:

Cardiovascular: Cardiac arrest; myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); pulmonary embolism and infarction; pulmonary edema; rhythm disturbances; atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis (hepatocellular or cholestatic jaundice), melena, anorexia, dyspepsia, constipation, glossitis, stomatitis, dry mouth.

Musculoskeletal: Muscle cramps.

Nervous/Psychiatric: Depression, contusion, ataxia, somnolence, insomnia, nervousness, paresthesia

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIONS and DOSAGE AND ADMINISTRATION).

Respiratory: Bronchospasm, rhinorrhea, sore throat and hoarseness, asthma, upper respiratory infection.

Skin: Extoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, herpes zoster, erythema multiforme, urticaria, pruritus, alopecia, flushing, hyperhidrosis.

Special Senses: Blurred vision, taste alteration, anosmia, tinnitus, conjunctivitis, dry eyes, tearing

A symptom complex has been reported which may include a positive ANA, an elevated erythrocyte sedimentation rate, arthralgias/arthritis, myalgias, fever, serositis, vasculitis, leukocytosis, eosinophilia, photosensitivity, rash, and other dermatologic manifestations.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASOTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause for discontinuation of therapy in 0.1% of hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause for discontinuation of therapy in 1.9% of patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASOTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIONS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation of VASOTEC and/or other concomitant diuretic therapy, were observed in about 11% of patients Increases in blood urea nitrogen or creatinine were a cause for discontinuation in 1.2% of patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g% and 1.0 vol %, respectively) occur frequently in either hypertension or heart failure patients treated with VASOTEC but are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1% of patients discontinued therapy due to anemia.

Other (Causal Relationship Unknown): In marketing experience, rare cases of neutropenia, thrombocytopenia, and bone marrow depression have been reported. A few cases of hemolysis have been reported in patients with G6PD deficiency.

Liver Function Tests: Elevations of liver enzymes and/or serum bilirubin have occurred.

Dosage and Administration: *Hypertension:* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, if possible, be discontinued for two to three days before beginning therapy with VASOTEC to reduce the likelihood of hypotension. (See WARNINGS.) If the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

If the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Dosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. If blood pressure is not controlled with VASOTEC alone, a diuretic may be added

Concomitant administration of VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases of serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose of enalapril is recommended for patients with a creatinine clearance > 30 mL/min (serum creatinine of up to approximately 3 mg/dL). For patients with creatinine clearance ≤ 30 mL/min (serum creatinine ≥ 3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum of 40 mg daily.

Heart Failure: VASOTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starting dose is 2.5 mg once or twice daily. After the initial dose of VASOTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*) If possible, the dose of the diuretic should be reduced, which may diminish the likelihood of hypotension. The appearance of hypotension after the initial dose of VASOTEC does not preclude subsequent careful dose titration with the drug, following effective management of the hypotension. The usual therapeutic dosing range for the treatment of heart failure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced morbility in patients with severe heart failure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day of VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACOLOGY, *Pharmacodynamics and Clinical Effects.*) Dosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)

Dosage Adjustment in Patients with Heart Failure and Renal Impairment or Hyponatremia: In patients with heart failure who have hyponatremia (serum sodium < 130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See DOSAGE AND ADMINISTRATION, *Heart Failure,* WARNINGS, and PRECAUTIONS, *Drug Interactions.*) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of four days or more, if at the time of dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.

MERCK SHARP & DOHME

ADD A SPECIALIST TO YOUR STAFF... BUT NOT TO YOUR PAYROLL.

MULTI-PRO 2.2 specializes in medical practice management.

Developed and offered exclusively by ANTEK, suppliers of quality computer systems and services, the MULTI-PRO 2.2 system is designed especially for use by the private medical sector.

MULTI-PRO 2.2 employs state of the art programming technology to dramatically accelerate routine billing and related procedures. The system prepares patient statements, easily handles complex primary and secondary insurance billing, follows up on delinquent accounts to assure cashflow and makes information you need available when you need it, at the touch of a key.

When you add MULTI-PRO to your staff, you take a giant step toward making your practice...perfect.

For more information and descriptive literature, contact...

Family therapy for colic.

The excessive crying of colic puts a strain on the most loving family–and often on their physician as well. And whatever the cause of colic, one fact is clear:

Gas is often part of the colic problem.

New Phazyme Drops contains simethicone, which can safely break up gas and bring baby relief. That's why it can help whenever colic is a problem.

Significantly reduces crying of colicky infants.[1]

p values (active vs. placebo) NS = Not significant •$p < 0.05$ †$p < 0.02$ ‡$p < 0.01$

Double-blind, randomized, placebo-controlled study.

Priced 25% below the leading brand.

This significant price advantage will be particularly important to parents, since they may be relying on Phazyme Drops for up to three months. And it's naturally flavored–something else they'll appreciate.

NEW **Phazyme®** **Drops** (simethicone/antigas)

Helps you through the colic phase.

The longer you look, the more we stand out.

Our commitment to provide local support and service for the nation's leading medical office computer system, THE MEDICAL MANAGER®, has made us the region's leading reseller for the last three years.

Our approach to client service is based on:

- THE MEDICAL MANAGER®, the most popular medical office computer system, with more than 7,000 installations nationwide.
- A network of three local offices staffed with experienced medical office management people and our own computer technicians.
- A system which includes any, or all, of the following:
  - ◊ Medical Billing
  - ◊ Clinical History
  - ◊ Electronic Claims
  - ◊ Scheduling & Recalls
  - ◊ Word Processing
  - ◊ Accounting

Interested? Call us for a list of references. Our clients can tell you about superior support and system performance.

Executive Director's Newsletter

June 1990

Reynaldo L. Lee-Llacer MD New Med Chi President

On May 11, 1990, Reynaldo L. Lee-Llacer MD became Med Chi's President for 1990-1991. During the Annual Meeting in May, Dr. Lee-Llacer said that he hopes to uphold the quality standards of care practiced in Maryland during the coming year and looks forward to a successful year as President of Med Chi.

Workers' Compensation Commission

Med Chi physicians are reminded that, under the Workers' Compensation Law, the employer and workers' compensation insurance carrier are responsible for the payment of the medical bills and not the Workers' Compensation Commission. If you do not know the name of the employer's insurance carrier, the bill should be forwarded to the employer with the request that it is to be sent to the carrier for payment. If the employer does not carry workers' compensation insurance, the employer is responsible for payment. If the health provider's bill is refused for payment by the insurer, you may file a claim with the Commission using the Commission's form C-51, but this is only to be filed after the bill has been refused or ignored. For more information regarding the Workers' Compensation Law, contact Lourenna E. Fisher, Secretary to the Workers' Compensation Commission at 301-333-4700.

Peer Review Handbook

In April, Med Chi in conjunction with the Board of Physician Quality Assurance (BPQA) introduced its *Peer Review Handbook* during the Federation of State Medical Boards of the United States Annual Meeting. The *Handbook*, a guide outlining the process for the review of physicians by their peers, was highly recommended by the Federation as a model program for other peer review programs in the US.

AIDS Testing

Physicians are reminded that effective November 1, 1989 healthcare providers (physicians, nurses, or designees of a healthcare facility) are required to do the following before obtaining a blood sample from an individual for the purpose of testing the blood for the presence of HIV infection:

1. Obtain written consent from the individual on a uniform HIV consent form developed by the Department of Health and Mental Hygiene.

2. Provide the individual with pretest counseling that includes: (a) education about HIV infection, (b) information about a physician's duty to warn, (c) assistance in accessing health care available to an individual who tests positive.

For further information on this matter, contact Greg Hall, Legal Counsel for the Faculty at 301-539-0872 or toll free 1-800-492-1056.

Doctors in Annapolis

Med Chi would like to thank all the physicians who participated as "Doctor of the Day" during this year's General Assembly Session. More than 54 physicians volunteered to staff the first aid room in the State House in Annapolis during the 64-day session. Med Chi and its physician members have staffed the first aid room for every legislative session since 1964 and greatly appreciate your participation in this endeavor.

Utilization Review for BC/BS Physicians of National Capital Area

Physicians participating in Blue Cross and Blue Shield of the National Capital Area (BCBSNCA) are reminded that their participation in BCBSNCA requires their cooperation in Utilization review audits in order to identify problems with overutilization. The following description of the BCBSNCA Utilization Review program is provided for your information.

Utilization Review (UR) The UR program at BCBSNCA for physicians and other health professional providers is administered by the Medical Affairs Division under the direction of the Senior Medical Director, Dr. Jack Kleh. Audits are conducted by registered nurses and supported by claims analysts and clerical personnel. UR has the responsibility of identifying those providers who do not adhere to accepted medical practice, as well as widespread inappropriate use of services, and taking corrective action. A panel of practicing physicians serves as advisors to this division and questionable cases are adjudicated by a professional panel comprised of local practicing physicians.

The primary objectives of UR are the prevention of overutilization and misutilization of health care services and the correction of aberrancies through informational and educational programs developed cooperatively with providers and their professional organizations. This process encourages communication with the healthcare community and allows for clarification of BCBSNCA's plans, policies, and procedures.

Defining the Problem Overutilization is unnecessary or repetitive performance of a covered service that is not clinically indicated or is not is conformity with the accepted practice of medicine in the community.

Misutilization is defined as the reporting of services not performed, the reporting of an ineligible service as an eligible one, or the upgrading of a service to obtain a higher fee. This may involve fraudulent actions on the part of either patient or provider.

Case Selection BCBSNCA uses various techniques to identify problems. They include:

Routine random audits: All providers are subject to audits that are routine in nature and randomly selected. These audits include the review of medical records and patient financial statements from the provider.

Investigation of Complaints: Many reviews are initiated by complaints from BCBSNCA subscribers or providers. UR pursues all complaints to resolution.

Special Studies: These are performed as a result of discrepancies uncovered during claims reviews. Claims are randomly selected and each claim is

verified through patient questionnaires and record reviews. UR may have several special studies under way at any given time.

Statistical Review of Cumulative Claims Payment Data: Computer listing of paid claims are generated for every provider reporting services to BCBSNCA which are then analyzed to detect unusual utilization, charge, or payment patterns.

Prepayment Review of Unusual Claims: These reviews are conducted before final processing is completed and the claim is paid. These provider or procedure specific reviews are in addition to the usual prepayment examination of all claims carried out in claims' processing areas. Criteria for initiating prepayment reviews vary as experience in processing claims increases. Examples of criteria used are:

-services frequently billed incorrectly
-services frequently overutilized

Special Research Studies: UR frequently conducts special studies to identify new areas for review and to assess the adequacy of the present system to assure cost-effective, quality health care.

Review Process A case is initiated when a potential problem is identified; it may involve any of the following steps. A UR case can be closed at any stage if the information developed provides a satisfactory explanation of the problem detected.

-Statistical Review: A statistical analysis of a providers' claims experience with peer group comparisons of practice patterns.

-Patient contacts: When appropriate, questionnaires may be sent to patients to verify that the services billed to BCBSNCA were rendered as reported. From time to time, patients may be interviewed by UR personnel. In either case, answers to the following questions are sought:

-For what medical problems did you visit the provider?
-When did you see the provider?
-What services were rendered?
-Did you make any payment toward these services, if so how much?

These patient contacts always are presented as routine verification of services paid by BCBSNCA. Plan personnel are trained to never comment on the appropriateness or quality of care and to avoid any improper reflection on the providers.

Discrepancies between information reported on the claim form and the patient's recollection of these services performed are pursued carefully. Every effort is taken to assess the reliability off the patient and the accuracy of the statements made.

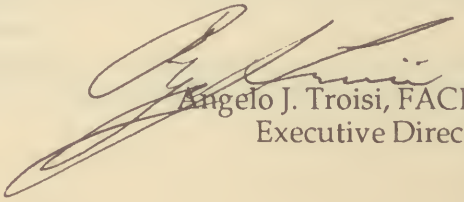
The Utilization Review Analysts Hospital and office records and the patients' questionnaires are reviewed and analyzed by the UR analyst. They also review statistical information and prepare summaries of individual practice patterns for a random selection of patients, covering a period of at least one year.

The Utilization Review Nurse The analyst's summary is reviewed, and as necessary, the nurse re-reviews each case for medical indications and appropriateness of care and questionable cases are prepared for medical advisor review. The nurse then prepares a written report of case findings, i.e., aberrant practice patterns, overutilization, and/or other problems.

Medical Advisor Review BCBSNCA has 26 specialties represented on the Medical Advisor Panel, all of whom are Board Certified Physicians in local private practice. When a case is submitted for review, the medical advisor provides written comment on the patterns of practice.

Physician/Provider Contact At the completion of the review, the provider is sent a detailed letter outlining the case findings. If a refund to BCBSNCA is indicated, it is requested at this time. The provider also is advised of his/her right of appeal and that additional information may be submitted for review.

The Committee on Provider Services Any UR Case that cannot be resolved between the Utilization Review staff and the provider under review can be referred to the Committee on Provider Services (CPS). Such a referral can be initiated by either the UR staff or the physician and/or provider. The CPS is charged, under BCBSNCA's Bylaws, with the resolution of disputes with physicians or other providers, and the Committee is empowered to take a wide range of actions to resolve issues brought before them. Any one or more of the following actions may be taken by the Committee:



1. Refer the case to the appropriate state or local professional society for recommendation or action.
2. Refer the matter to the appropriate federal, state, or local law enforcement agency.
3. Refer the matter to the appropriate State Board of Professional Licensure.
4. Consider the review provider's participating status.
5. Direct further study by BCBSNCA staff.
6. Request the provider to make an appropriate refund and correct his or her reporting practice.

The decisions of the CPS are final.

Resolution Following a decision by the CPS, UR contacts the provider to finally resolve the problem. This may involve a change in the provider's reporting of services and may require the provider to refund overpayment.

Quality of Care The Medical Affairs Division also supports programs to improve the quality of care provided by BCBSNCA subscribers. UR is involved in the development of several new programs aimed at improving healthcare delivery and arranging financing that improves quality of care available by locality.

Summary The major thrust of the program is to prevent overutilization of healthcare services through the education of providers and subscribers. If you accept the premise that no one benefits from unnecessary medical costs, then you are in agreement with the Utilization Review program at BCBSNCA. For further questions regarding the BCBSNCA Utilization Review program contact Cora Yao, Assistant Supervisor for Utilization at 202-479-8000.

LifePlus Introduces Exotic Flavors

Move over chocolate, vanilla & strawberry. LifePlus has introduced **PINA COLADA** and **ORANGE SHERBET** flavored shakes to its physician-supervised weight control program – a program that combines a modified fast with behavior modification, nutritional counseling and exercise.

"We've eliminated the boredom of the typical modified fast. People crave variety. That's why we were first to introduce creamy chicken soup, and now we have exotic flavors. Just in time for the summer, these new flavors will help patients feel that they're not missing out on summer fun just because they're on a diet," says Cleo Bennett Kelly, president of LifePlus.

The shakes and soups, which are available in two high protein formulations, are low in fats, carbohydrates and cholesterol, yet high in protein and essential amino acids. LifePlus is only available through physicians. For information or samples, call LifePlus.

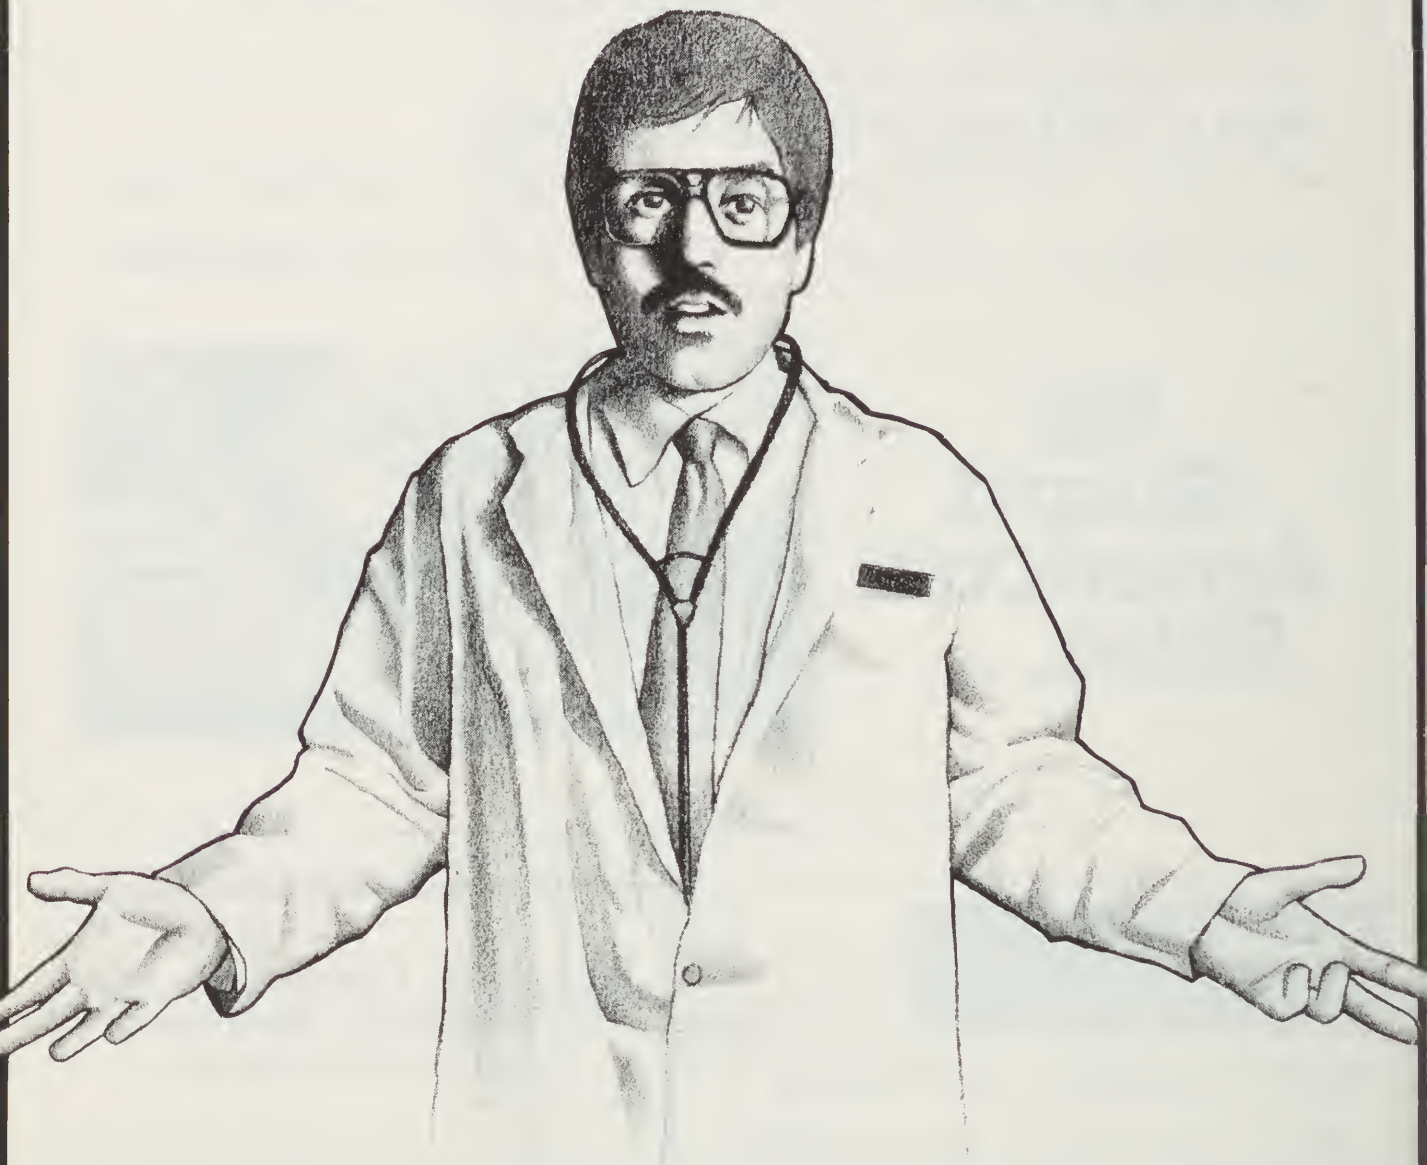
MARYLAND CENTER FOR THE TREATMENT OF IMPOTENCE

featuring the ErecAid System

The ErecAid System is a simple, safe and effective treatment for impotence without the risks and expense of surgery or drugs. It is useful for the treatment of impotence due to the following:



- Diabetes
- Hypertension
- Spinal Cord Injury
- Implant Protheses Reversal
- Medication Reaction
- Prostate Surgery
- Vascular Disease
- Multiple Schlerosis
- Psychogenic Factors

For the treatment of impotence

St. Agnes: A Community Teaching Hospital

Francis J. Viozzi MD

Dr. Viozzi is Senior Vice President/Medical Director at St. Agnes Hospital.

Because Maryland is the home of three major medical universities we are accustomed to hearing about significant clinical advances, research breakthroughs, and frequent epidemiologic studies as a matter of course. Our provider worlds, including both physicians and facilities, encompass the entire spectrum of specialization. Amidst this array of services and facilities, interacting with them at all levels, is the community teaching hospital.

St. Agnes Hospital is pleased to bring you this issue of the *Maryland Medical Journal*. A perusal of the article titles helps define our hospital's role in this medical milieu. The papers submitted by attending and resident staff reinforce our commitment to resident education and underscore its importance in maintaining the quest for academic excellence.

We have addressed both clinical and public health issues. Dr. Gillilan and his colleagues have studied the experience of our hospital in a community program, the cardiac outpatient rehabilitation program, which has an admixture of clinical, educational, and preventive aspects.

Utilization and quality assurance issues are discussed in the article by Dr.Ranjan et al., which addresses the appropriateness of routine operative cholangiography.

Unusual disorders appear sporadically, and our staff must recognize and cope appropriately with them. This aspect is reflected in case reports about scurvy, a lateral lumbar synovial cyst, thyrotoxic periodic paralysis, and phenytoin hypersensitivity.

Community hospitals must bridge the gap between technologically rich, research-oriented institutions and the populations they serve. Drs. Kramer and Tippett use the state-of-the-art magnetic resonance imaging to define a clinical problem.

Last, but hardly least, our commitment to the health of the community is reflected in Dr. Susel's paper that considers the operation of an eye bank.

As these articles point out, we consider our obligation to our community's healthcare needs to be paramount. We take seriously and are appropriately introspective about our commitment to resident education. Our medical staff is clinically excellent, and its questioning nature facilitates investigation of clinical dilemmas. Notable by its absence is bench research: we do not include it in our mission. We do reach out to the community in ways we hope will improve its health status. ■

The Dual Diagnosis Treatment Program of Sheppard Pratt

Patients with psychiatric illness and drug or alcohol problems present complex diagnostic and treatment challenges.

Sheppard Pratt's inpatient units are designed and staffed specifically for the treatment of these complicated patients.

We provide:

- ☐ Comprehensive psychiatric and chemical dependence evaluation;
- ☐ Specialized programs for patients with affective disorders, anxiety disorders, schizophrenia and learning disorders;
- ☐ Psychopharmacological evaluation and treatment;
- ☐ Specialized programming for the gerontological patient who is chemically dependent;
- ☐ Addiction education for the psychiatric patient who is resistant to treatment for chemical dependence; and
- ☐ On site Double Trouble, AA and NA meetings.

Founded in 1853, Sheppard Pratt is a 322-bed private, not-for-profit psychiatric hospital that provides comprehensive diagnostic and treatment services for short, intermediate or long term patients as well as outpatient and partial hospitalization care.

For more information about Sheppard Pratt's approach to the dually diagnosed patient, or to make a referral, contact the Adult Admissions Office at:

(301) 938-3800
6501 North Charles Street
Baltimore, Maryland 21285-5815

Rehabilitation of Cardiac Outpatients: A Community Hospital Experience in the 1980s

Ronald Gillilan MD; Katharine Beasley RN, BS; Elizabeth Booth RN, BSN; Annette DeAngelis; J. Richard Warbasse MD; and Stephen Plantholt MD

From St. Agnes Hospital's Department of Cardiology.

St. Agnes Hospital's decade of experience with outpatient rehabilitation of coronary heart disease patients shows that exercise conditioning plays an important role in their return to even strenuous work after suffering a myocardial infarction.

In the 1970s cardiac rehabilitation programs developed widespread acceptance as a means of assisting patients with coronary heart disease (CHD) return to normal living. Medically supervised exercise became the mainstay of such rehabilitative efforts, with more than 40 centers in Maryland having facilities and trained staff to assist patients with myocardial infarction (MI), angina pectoris (AP), or coronary bypass surgery become physically fit.[1]

The late 1980s saw the decline of some such programs, due at least in part to the reluctance of a major insurance carrier in Maryland to pay for cardiac rehabilitation and to the failure of many physicians to send their patients for the service. As noted by Smith, cardiac rehabilitation services are greatly underused, with only 20 percent of patients with MI, AP, and/or recent coronary bypass or angioplasty in the United States being given the opportunity of such services.[2]

This report examines more than a decade of experience of St. Agnes Hospital's Cardiac Outpatient Rehabilitation (COR) program, points out some lessons learned as data have emerged from clinical trials, and discusses trends and possible directions for the 1990s for such rehabilitative efforts.

Prescription Exercise in Cardiac Rehabilitation

Medically supervised exercise has been a key element in cardiac rehabilitation programs. Patients with recent MI often are physically unfit, not just because they have been at bed rest a few days but because of a lifestyle that for years has neglected essential health practices. Although shortened hospital stay for acute myocardial infarction (AMI) has helped reduce the deconditioning effects of prolonged bed rest, regular exercise still has an important role in the rehabilitation of most patients with CHD. In the process of restoring regular exercise as an essential health practice, patients learn sensible limits for their physical activities. Exercise programs provide information along with exercise as a treatment modality for patients with heart disease.

In recent years, the vast experience gained (both in this country and abroad) in rehabilitation of patients with heart disease has

taught us much about the safety of relatively vigorous exercise and has shown that many patients can return to jobs that in earlier years would have been prohibited. Conditioning exercise is not without risk in the coronary population, hence the need for monitoring and medical supervision. As discussed below, the COR program has a high proportion of patients with severe coronary disease, yet there have been only 3 untoward cardiac events in the entire 13-year experience of the program. This emphasizes the fact that many patients with severe heart disease need not be denied the benefits of exercise. A survey of 167 randomly selected cardiac exercise programs in the early 1980s showed that prescribed exercise can be delivered with low risk of unfortunate cardiovascular events.[3]

Given the propensity for cardiac events in patients with advanced disease, as is the case of most of our patients in COR, it is appropriate to have them exercise under medical supervision. There have been two cardiac arrests and one AMI in 43,786 patient hours of exercise in COR. Neither of the cardiac arrests were directly related to exercise: one patient collapsed before beginning exercise and the other did so while having the admission history and physical for entrance into the program. Prompt resuscitation efforts were successful for one patient who went on to have an implanted defibrillator for control of severe arrhythmias. The other patient did not survive cardiac arrest due to extensive heart disease. The patient who had an AMI failed to inform the staff before beginning exercise that he had been having recurrent chest pain earlier in the day. This patient made a good recovery from his infarction, which probably was in progress when he arrived at the program. The lesson here is the need to teach patients and their spouses to recognize the early signs of heart attack and to get prompt attention for such symptoms. Programs such as COR offer an important opportunity for such teaching to occur.

Inasmuch as COR is a hospital-based program that utilizes electrocardiogram (ECG) and blood pressure monitoring, patients with advanced coronary disease increasingly are included. In 38 consecutive referrals to COR, 24 (63 percent) patients had complex ventricular arrhythmias, 5 (13 percent) had very limited exercise tolerance (less than 3 minutes on the Bruce treadmill test), 3 (8 percent) had marked ischemia on the ECG during exercise testing, and 2 (5 percent) patients had exertional hypotension. Such patients are not good candidates for an unsupervised exercise program.

Greenland and Chu point out that the most severely limited patient can be expected to make the most meaningful achievements in exercise programs.[4] We studied 22 patients (13 men; 9 women), ages 43 to 69 years who had severely limited exercise tolerance on maximal treadmill testing (failure to complete stage 1 of Bruce protocol) because of coronary disease. These patients exercised 2 to 3 times weekly in COR for a mean of 23 weeks. Follow-up treadmill testing showed an average improvement in exercise capacity of 156 percent, with estimated maximal oxygen consumption increasing from 1.77 to 25.30 ml/Kg/min ($p < 0.01$). Such remarkable improvement in exercise tolerance in 15 of 22 patients who initially were severely limited makes it clear that cardiac rehabilitation efforts have a place in the treatment of patients who still are incapacitated by their disease despite the best efforts of medical and surgical therapy.

Monitoring cardiac patients during exercise by a trained staff (which in the case of COR consists of a coronary care nurse, an exercise technologist, and a cardiologist) not only has helped to assure safety in the COR program but also has provided early detection of important diagnostic and treatment needs. In 50 patients with coronary disease referred for rehabilitation, 19 (38 percent) had diagnostic and treatment decisions made during 14 weeks of participation in this ECG monitored exercise program.[5] Such decisions were made by the referring physician, based on data provided by the COR cardiologist on frequency of chest pains, severity of hypertension, and extent of exercise-induced complex ventricular arrhythmias. We believe early intervention initiated due to the observations made by the COR staff prevented more serious events in the course of the patient's disease. In some instances, patients who had refused cardiac catheterization or surgery were willing to go ahead with such needed procedures after their favorable experiences with the staff and other patients in COR.

There were noteworthy developments in the programing of exercise for patients with heart disease in the 1980s. With experience showing that sensible aerobic exercise is relatively safe in patients with coronary disease, it became possible to look at physical activities other than the traditional walking, jogging, biking, and rowing to add variety to fitness programs. Community based, medically supervised exercise programs offered pools for swimming and gymnasiums with opportunities for volleyball, basketball, and other sports.

Compliance: Over- and Underachievers

We studied 40 men (who had documented coronary disease) with Holter monitoring of ECG during exercise in a community gymnasium to determine compliance of patients to their exercise prescription. The ambulatory recording of ECG during exercise showed that 32 percent of patients overachieved by exceeding their prescribed exercise limits, while 28 percent (11) of patients underachieved to a level of exercise that could not be expected to produce fitness.[6]

Patients who tend to overachieve during exercise concern treating physicians, particularly when those patients are left to do home exercise programs at their own pace or to work out in an gymnasium or spa without medical supervision. In medical practice we are aware that some patients tend to work and play too hard, and we are perhaps lulled into a sense of security that our patients will follow our advice to take it easy.

But in a rehabilitation program with trained medical observers, it becomes obvious that some patients do not follow the advice given.

We found that in 21 patients who had Holter recordings during a home exercise program, only 33 percent (7 patients) stayed within the limits of exercise prescription during their workout. Of these 21 patients with coronary disease, ambulatory recordings revealed that 6 (29 percent) patients had ischemic ST-segment depression on ECG and 4 (19 percent) patients had complex ventricular arrhythmias during their overly zealous exercises at home.[7] On questioning, 3 (14 percent) patients had experienced anginal pains during bike riding or walk/jog activities done without supervision. Using a walk/jog, self-efficacy scale of perceived exercise, we have been able to discriminate between overachievers and underachievers.[8] Further work is needed in the area of psychological testing to help identify patients who may be at higher risk of a cardiac event during exercise sessions because of the tendency to exceed the safe limits of their exercise prescription.

Another development in exercise methods has been the attention given to more specificity in training, thus targeting specific muscle groups for improvement in function for a particular job or avocational skill. Experience in Maryland showed that circuit weight training could be safely and effectively used within certain guidelines with patients with coronary disease.[9] Thus patients who have to return to a job that requires lifting can be monitored and trained with particular emphasis on upper extremity resistance exercises in a medically supervised environment before returning to work.

A trend in the patient population of COR over the past few years has been an increased number of individuals who have had coronary bypass surgery or coronary angioplasty. By the mid-1980s, of 80 attendees, 19 (24 percent) had bypass surgery, and 9 (11 percent) had undergone angioplasty of their coronary arteries. By the end of the 1980s, 27 (33 percent) of 82 patients participating had bypass surgery and 14 (17 percent) had angioplasty. These patients are particularly good candidates for supervised exercise programs, as such monitoring provides data to the treating physician during the first several postoperative months, when reocclusion is most likely to occur. The patient also has the opportunity to explore with the rehabilitation staff whether various symptoms should give concern. Patients who have had surgical intervention for their coronary disease need no less an effort at risk-factor intervention and exercise conditioning. As yet insurance carriers have not been willing to pay for rehabilitation of the postangioplasty patient. Controlled clinical trials to provide further support for the benefits of rehabilitation services in the postangioplasty period likely will be forthcoming.

While a sedentary lifestyle is recognized as a risk factor for coronary disease, it has been difficult to prove that exercise conditioning in patients with coronary disease lowers the risk. A recent study that received widespread attention showed a significantly lower heart attack rate in healthy subjects because of physical conditioning with higher treadmill performance.[10]

O'Connor et al. reviewed various controlled clinical trials examining the effects of exercise conditioning on mortality and found that, while no single trial achieved statistical significance, cardiac rehabilitation programs that included exercise showed an overall reduction in risk of death by 20 percent.[11]

ECG monitoring in the COR program has provided a battery of information to assist the cardiologist in making treatment decisions regarding ventricular arrhythmias. At present there is considerable uncertainty as to the appropriate use of antiarrhythmic agents for such patients. Telemetered ECG programs provide the treating physician with additional data about the success of various antiarrhythmic treatments.

We analyzed the ventricular arrhythmias in 100 subjects (84 men, 16 women; mean age 54 years) with coronary disease who were referred to COR. There were complex and frequent ventricular arrhythmias (Lown grades III-V) in 32 percent (32 of 100) of patients during the initial week of participation in ECG monitored exercise. By the last week of telemetered exercise, there had been a statistically significant decrease in both severity and frequency of complex arrhythmias in these patients (4 percent or 4 of 100 patients continued to have grades III-V arrhythmias). This is not to imply that exercise necessarily played a major role in reducing the arrhythmias, as antiarrhythmic drug therapy was instituted or revised in many instances. While there is no control population for comparison in this preliminary study, the data show that the COR program provides physicians with important data to assist in treating patients with cardiac arrhythmias.

Risk-Factor Intervention

As the decade of the 1980s has given us thrombolytic therapy for the patient with AMI and angioplasty for the person with angina pectoris, an increasing awareness has developed that prevention of the progression of coronary disease through risk-factor intervention also must be included in the physician's weapons against atherosclerosis.

Although cardiac rehabilitation programs traditionally have emphasized exercise conditioning for patients recovering from MI, patient education on the role of risk factors in coronary disease has been an important component of such programs. It has been our experience that a substantial number of patients referred to COR have modifiable risk factors, thus providing the opportunity for the cardiac rehabilitation team to include management of factors tending to cause progression of the disease. Rehabilitation programs have increasingly become involved in coronary risk-factor intervention.

In a survey of 80 patients (62 men, 18 women; age

range 32 to 75 years) with established CHD who were referred to COR for rehabilitation, 32 (40 percent) patients had a history of hypertension, 22 (28 percent) were at least 20 percent overweight, 21 (26 percent) had a total cholesterol level of greater than 260 mg percent, and 10 (12 percent) of the 80 subjects still smoked. While some interventions are beyond the scope of present practices and resources of rehabilitation programs, patients are given education, encouragement, and support to help motivate appropriate behavioral changes.

A growing interest in the COR program has been in dietary intervention for hyperlipidemia (HL). Not only was this risk factor prevalent in our population, but also findings of a survey of our referring physicians indicated a need for a service to assist with this intervention. Of the 24 physicians who referred the 80 patients mentioned above, 71 percent thought that patients were inattentive to lifestyle recommendations and were not likely to follow dietary recommendations. Furthermore, 38 percent of the referring physicians indicated there was insufficient time in their office practice to influence such behavioral changes, and 70 percent noted a need for better skills to appropriately manage the patients with HL.

During the last decade, the COR program has focused increasingly on providing this needed support service for lipid management.

Studies such as the Lipid Research Clinics Primary Prevention Trial have provided strong evidence that lowering elevated blood cholesterol significantly reduces the risk of coronary events in asymptomatic men.[12] The NHLBI Coronary Intervention Study gives reason to believe that treating hypercholesterolemia in patients with established coronary disease can slow the progression of atherosclerotic lesions.[13]

Inasmuch as patients participating in COR attend sessions for several months, there is perhaps an unparalleled opportunity to affect behavioral changes related to eating habits. The staff for the service is comprised of the COR nurse trained in risk-factor interventional skills, the nutritionist, and a cardiologist interested in preventive cardiology. Computer support for diet analysis has been an important element of the program.

While influencing behavioral changes related to diet is never easy and there is still much to be learned about this important intervention, data from our program suggest that the cardiac rehabilitation program setting is appropriate for lipid management. In 27 patients having follow-up a mean of 43 months (SD 8.9 months) after entering COR, there continued to be significantly lower mean total cholesterol levels (214 mg/dl vs. 252 mg/dl) than at entry into the COR program. We have no control group of untreated subjects for comparison, nor is there data on patients who have been lost to follow-up, but the trend in lipid levels is encouraging in our participating patient population.

While lipid management can be offered in cardiac rehabilitation programs, there is a cost of time and effort to provide the service. Not only are the services of a nutritionist needed, but also in our experience, roughly 3.5 hours of additional staff time are required for the initial evaluation and counseling of a patient. Further training among the staff also is required to be knowledgeable about lipids and to be effective in helping with such behavior modification. The American Heart Association has been particularly helpful in providing such support.

Patient Education and Psychosocial Support

Early hospital discharge of patients following an AMI has placed a greater burden on outpatient services for providing the education and guidance patients require to cope successfully with CHD. In the past, there were often several weeks of hospitalization during which the patient was counseled about the nature of coronary disease, emotional adjustment, physical activity, sex, recreation, family relationships, and risk-factor intervention. At present, with limited hospital stay, the patient is busy with various testing procedures, leaving little opportunity for professional staff to address psychosocial, economic, and vocational adjustment issues.

Outpatient cardiac rehabilitation programs can and often do fill a vital educational and psychosocial support need for patients with CHD. An improved sense of physical and emotional well-being has been the general experience of participants in such programs, but there is need for more documentation of outcomes through careful behavioral scientific research.[7]

The goals of rehabilitation programs include educating the patient about risk factors, assisting in making lifestyle changes that may reduce the chances of another MI, and helping the family understand and cope successfully with the impact of coronary disease. Such educational efforts for the patient and his/her family must teach the importance of recognizing when chest pain requires the immediate medical attention. Far too many patients with chest pain do not reach an emergency room in time for appropriate intervention.

Conclusion

We have discussed a decade of St. Agnes Hospital's experience with CHD outpatient cardiac rehabilitation. Exercise conditioning still plays an important role in the rehabilitation of such patients, and experience has taught that many patients can return to strenuous work after suffering a MI. The environment of cardiac rehabilitation provides a good opportunity for patient education and behavior modification. New directions for the future for such programs have emerged from the progress that has been made in the 1980s. There is a need for greater utilization of this important service for patients with angina pectoris.

The monitoring of patients in cardiac rehabilitation programs during their return to normal living habits following MI, bypass surgery, or angioplasty provides

the physician with valuable data for the management of patients with coronary disease.

White-Coat Hypertension: Detection and Evaluation

Jack Long DSW, Ronald Gillilan MD, Soo Gil Lee MD, Choong R. Kim MD, and Stephen Plantholt MD

From the Division of Cardiology, Department of Medicine, St. Agnes Hospital, Baltimore.

A comparison of subjects' blood pressures during office, ambulatory, and psychophysiological stress tests suggests further research is needed to better understand the importance of such testing on white-coat and fixed hypertensive patients.

A randomized crossover design was used to compare the effects of propranolol and placebo on blood pressures of 32 (7 "white-coat" and 25 fixed hypertensive) patients and 9 normotensive individuals in the office, by ambulatory monitoring, and during a psychophysiological stress test.

Monitoring Blood Pressure

Casual office blood pressures taken by a physician using a sphygmomanometer commonly are used to evaluate the hypertensive patient. Technological advances have given the clinician reliable and accurate 24-hour ambulatory recorders that afford a look at the patient's blood pressure in the everyday environment.[1] Automated monitors available for office use allow the clinician or researcher to observe minute-by-minute blood pressure changes in the clinic or laboratory situation while the patient is exposed to a variety of stressful activities.[2,3]

Increased reactivity to challenging life situations is thought to place the patient at higher risk for sustained hypertension.[4] Some research evidence suggests that 24-hour ambulatory recordings are more useful for determining whether a patient should or should not be treated for hypertension.[5-7] Other reports indicate that exaggerated blood pressure responses to situational stress induced in the laboratory is predictive of cardiovascular complications related to elevated blood pressure.[8,9] Both ambulatory recording and laboratory monitoring of blood pressure suggest that better diagnosis and treatment result from more comprehensive blood pressure assessment methods.

The term "white-coat" hypertension has been coined to identify patients who have daytime ambulatory blood pressures persistently in the normotensive range while their office blood pressures are in the hypertensive range.[7,10-12] Krakoff and others have suggested that diagnosis of hypertension may be improved with ambulatory recorders by showing the need for and defraying the cost of treatment.[6,11,13]

Automated blood pressure devices have changed the dynamics

between patient and physician. The new devices provide the opportunity for the patient to participate in stressful activities and for the clinician or researcher to engage the patient in verbal interaction. While blood pressure typically increases when an individual speaks, blood pressures of hypertensive patients increase more dramatically than do those of normotensive individuals.[3,14] Blood pressure differences between normotensive and hypertensives are particularly evident during speech about emotionally loaded subjects.[15,16] Perceived difference in status between subject and researcher also contributes to higher blood pressure when the subject speaks.[18]

Our study was designed to examine and compare the different blood pressure responses of white-coat hypertensives treated with propranolol or placebo. We were particularly interested in examining a psychophysiological stress protocol intended to profile the patient's response to stress and to add information diagnosis and for treatment decisions.

Methods

Thirty-two patients with mild hypertension (20 men and 12 women) were selected from a list of 53 referrals from practitioners in the St. Agnes catchment area.

All patients entering the study had been treated for hypertension at least one year, were between 21 and 70 years old, and were not taking antianxiety or antidepressant medications. Patients with atrial fibrillation were excluded from the study because of difficulty in obtaining blood pressure readings.

Twelve volunteers with no history of hypertension also were recruited for the study. Three of the recruits were found to have hypertensive blood pressures during office measurements and were rejected from the study. The nine remaining normotensive volunteers (7 men and 2 women, ages 37 to 68 years) participated in the psychophysiological stress test and wore a 24-hour ambulatory recorder. This group received no study medications.

The study was a randomized, double-blind crossover comparison of propranolol and placebo. Patients were weaned from their antihypertensive medications prior to participation in the study, and a medication-free week was used to verify that each patient was indeed hypertensive. A dose titration period was used to determine the appropriate doses of propranolol for each patient (Table 1). Dose titration continued two to six weeks until each patient's blood pressure reached normotensive levels.

Table1. Propranolol Dose Levels for Hypertensive Patients

	Dose Level (mg/day)				
	60	120	160	240	320
Male	3	4	6	2	5
Female	3	3	3	3	0
Total	6	7	9	5	5

During the randomized treatment phases of the study, all patients took placebo for two weeks and the appropriate dose of propranolol for another two weeks. During the last half of the second week of each drug sequence, blood pressure data were collected.

Office blood pressure A random zero mercury manometer was used to measure three casual office blood pressures in the patient's nondominant arm after the patient rested for at least ten minutes. Office blood pressure measurements generally were made in the morning by either a physician or technician.

Daytime ambulatory recording An ambulatory device using an electrocardiogram (ECG) signal with an electrical transducer for recording Korotkoff sounds was used to measure blood pressures. Recordings were made at half-hour intervals in the nondominant arm during the day. Average daytime pressures (8am to 10pm) were used for data analysis. The machinery alerted the researcher to spurious blood pressure readings by giving an error message in the case of technical difficulties.

In addition, two observers independently audited the 24-hour readings. If the two observers concurred on readings that appeared spurious, the readings were excluded from the data. A third observer reconciled the differences when the two observers disagreed as to the validity of the readings.

Criteria similar to that set forth by Krakoff et al. and Weber by were used to compare office blood pressures with daytime ambulatory pressures to identify white-coat hypertensives.[6,11] Patients (while on placebo) whose office blood pressures were in the hypertensive range (140/90 or more) and whose average daytime ambulatory pressures were less than 130/85 were considered to have white-coat hypertension.

Psychophysiological testing A 35-minute computerized psychophysiological test was administered to each patient. The test began with three to four resting blood pressure measurements taken at one-minute intervals using an automated oscillatory device. Blood pressures recorded with the automated device were comparable to sphygmomanometer readings. Interview stress included three speaking interactions with the researcher; speaking about health (3 minutes), speaking about work (3 minutes), and speaking about home (3 minutes). Mental stress consisted of reading aloud and explaining the reading (4 minutes), and oral mental arithmetic (3 minutes). Physiological stress included three physical activities: valsalva maneuver (1 minute), isometric hand grip (3 minutes), and cold pressor (3 minutes). A 1 to 2 minute rest period separated each stressor.

Data analysis was performed to identify white-coat hypertensives and to compare office, ambulatory, and psychophysiological blood pressures. Statistical methods included T-testing and analysis of variance.

Results

A total of 53 patients were interviewed for the study; 32 qualified. Twenty-eight percent (15 of 53), found to

be normotensive after being withdrawn from their antihypertensive medications, were excluded from the study. The mean office blood pressure for the 32 hypertensives, while on placebo was 146 (± 17.1)/97 (±6.8) mm Hg. For the 9 normotensive, mean office blood pressure was 114 (± 10.3)/71 (± 9.2)mm Hg.

Approximately 28 daytime ambulatory blood pressure measurements per patient were made during each of the two treatment phases. The machine was successful in recording 96 percent of the blood pressures it attempted to measure. Of those recorded, 91 percent were considered to be clinically accurate by the 3 auditors. There was a 97 percent concordance between the 2 independent observers. Ambulatory recordings identified 7 of the 32 (22 percent) hypertensive patients as having white-coat hypertension. The remaining 25 patients who had hypertension by office and ambulatory blood pressure measurements were deemed to have fixed hypertension for the purposes of this study.

Blood pressure was recorded 35 times at one-minute intervals during the psychophysiological stress test. The first three to four resting pressures taken before the actual verbal interaction began were used as baseline average.

Table 2 shows the average blood pressures for white-coat hypertensives, fixed hypertensives, and normotensive when taken in the office, at home by ambulatory recorder, and during the psychophysiological stress test.

For systolic blood pressure there was a statistically significant main effect of group ($F = 6.25, p < .02$) and no statistically significant effect of setting nor interaction between group and setting. Therefore, systolic blood pressure differentiated white-coat hypertensives from fixed hypertensives for each setting, but there was no marked within-treatment difference in systolic blood pressure for either group between settings.

For diastolic pressure, there was a statistically significant effect of both group ($F = 17.9, p < .0001$) and setting ($F = 9.09, p < .0005$). There was also a statistically significant interaction between group and setting ($F = 4.84\ p < .05$). Diastolic blood pressures of white-coat hypertensives were noticeably lower during the ambulatory measurement.

Systolic and diastolic blood pressures were significantly lower for each setting when fixed hypertensives were taking propranolol (minimum $t = 2.07$, $p < .05$ and maximum $t = 5.76$, $p < .0005$). For white-coat hypertensives there was a statistically significant effect of treatment for only diastolic pressure ($t = 4.15$, $p < .001$) in the office setting. Average blood pressures of white-coat hypertensives were in the normotensive range during ambulatory and baseline psychophysiological measurements regardless of the treatment modality.

Table 3 shows the comparative diastolic blood pressures for each psychophysiological stress relative to treatment.

There was no statistically significant effect of group on diastolic blood pressure. The diastolic blood pressures of white-coat and fixed hypertensives were similar within treatment for each of the psychophysiological stresses. For the fixed hypertensives there was a statistically significant effect of treatment for each of

Table 2. Comparative Blood Pressures for Different Settings and Drug by Group

Group	No. of Patients	Office		Ambulatory		Baseline Psychophysiological	
		Placebo	Drug	Placebo	Drug	Placebo	Drug
White-coat hypertensives	7	134 (6.6) 94 (4.9)	126 (13.9) 81 (6.5)	128 (4.3) 78 (4.5)	121 (15.7) 76 (7.7)	134 (12.7) 87 (10.1)	131 (13.1) 83 (7.6)
Fixed hypertensives	25	149 (17.8) 98 (6.9)	129 (16.1) 84 (10.0)	150 (9.4) 93 (5.4)	132 (14.3) 80 (8.4)	140 (13.8) 90 (7.5)	131 (17.9) 82 (10.1)
Normotensives	9	114 (10.3) 71 (9.2)		124 (10.3) 74 (9.5)		112 (4.5) 69 (3.3)	

Table 3. Comparative Diastolic Blood Pressure for Psychophysiologic Stresses and Drug by Group

	No. of Patients	Baseline		Interview		Mental		Physical	
		Placebo	Drug	Placebo	Drug	Placebo	Drug	Placebo	Drug
White-coat hyptensives	7	87 (10.1)	83 (7.6)	95 (7.4)	88 (4.9)	92 (9.5)	87 (10.0)	92 (5.9)	87 (6.3)
Fixed hypertensives	25	90 (7.5)	82 (10.1)	97 (6.6)	87 (9.0)	95 (8.1)	87 (11.4)	96 (9.2)	89 (10.5)

Mean Values with Standard Deviations

the four psychophysiological stresses minimum ($t = 2.44$, $p < .02$). For the white-coat hypertensives there was no statistically significant effect of treatment on any of the four psychophysiological stresses. Though the differences between treatments were not statistically significant, their trend was in the same direction as the fixed hypertensives.

We then looked at patients whose baseline Psychophysiologic Stress Test blood pressures were less than 90 mm of Hg when on placebo. (Table 4) Diastolic blood pressure of 90 mm Hg or greater was used as a cutoff, to identify the percentage of white-coat hypertensives, fixed hypertensives, and normotensives who had elevated pressures during the various psychophysiological stresses.

The percentage of diastolic blood pressures greater than 90 mm Hg was similar for white-coat and fixed hypertensives. For both groups propranolol treatment decreased the number of diastolic blood pressures in the hypertensive range. However, compared to the normotensive, both white-coat and fixed hypertensives had significantly more hypertensive diastolic blood pressures. This finding was mainly because the normotensive had lower baseline pressures.

Discussion

Of the 53 referrals from the St. Agnes catchment area, 28 percent were found to be normotensive after one to three weeks without antihypertensive medication, suggesting that periodic re-evaluation of antihypertensive medications may be appropriate for mild hypertensive patients.

We identified a group of hypertensive patients who fit the criteria for white-coat hypertension. While propranolol significantly lowered blood pressure for the white-coat hypertensive in the office, the drug had no statistically significant effect during ambulatory recording. This was in contrast to the fixed hypertensives whose blood pressures were significantly lower during treatment in each of the three settings during which blood pressure was recorded. The blood pressures of white-coat and fixed hypertensives behaved differently only in the ambulatory setting.

Initially it was assumed that the setting of the baseline psychophysiological measurement was similar to the office setting. Therefore, we predicted that the blood pressures in the office and during the baseline period of the psychophysiological test would be similar. Blood pressures of both white-coat hypertensives and fixed hypertensives were lower in the baseline psychophysiological measurements than in office measurements. The blood pressures of fixed hypertensives during baseline psychophysiological measurements were similar to those found during ambulatory measurements. This was not true for the white-coat hypertensives whose blood pressures were somewhat higher in both the office and during psychophysiological measurements. This finding supports the notion that white-coat hypertensives are more reactive to the medical setting.

We found white-coat and fixed hypertensives' diastolic blood pressures were consistently higher during psychophysiological stress than during ambulatory recording. While propranolol substantially decreased the percentage of hypertensive diastolic blood pressures for both white-coat and fixed hypertensives, they still had significantly more pressure measurements in the hypertensive range than did the normotensive group. The psychophysiological stress test apparently was measuring something different than the ambulatory recorder.

Diastolic blood pressures of white coat hypertensives were similar to diastolic blood pressures of fixed hypertensives during stress. It is likely the stress test focused the patient on personal issues during the interview, challenged him or her with performance issues during the mental stress, and physically taxed him/her during the physiological stress. There was no attempt to stress the patient during the interview; instead the researcher merely encouraged the patient to talk about health, home, and work.

While it has been documented that the act of speaking raises blood pressure, the hypertensive patient is more reactive to verbal interaction.[14-16] In this study, we found no difference between the white-coat and fixed hypertensive with regard to this reactivity. The increased focus during stress testing may have amplified or identified areas that were not encountered during ambulatory monitoring. Since situational stress response is thought to be predictive of cardiovascular complications,[9] these findings suggest the psychophysiological test could be a useful adjunct to office and ambulatory measurements.

Propranolol does not seem to suppress the blood pressure response for the hypertensive, rather it lowers the baseline and thus keeps the blood pressure below 90 mm Hg during stress. These findings bring into question the value of controlling the hypertensive at the marginal area of 85 to 90 mm Hg. It is unclear why there was no significant effect of the propranolol on the white-coat hypertensive during the ambulatory

Table 4. Percentage of Drug and Placebo Treated Hypertensives with Diastolic Blood Pressure Greater than 90 mm Hg during Psychophysiologic Stress Testing

	No. of Patients	Interview (%)	Mental Stress (%)	Physical (%)
Fixed hypertensives				
Drug	21	47	35	41
Placebo	15	66	57	65
White coats hypertensives				
Drug	6	39	54	39
Placebo	5	60	43	60
Normotensives				
Drug	9	1	9	10

recording while there was a significant effect during the office and psychophysiological stress test. However, propranolol ameliorated the stress particularly inherent to the office setting and during psychophysiological testing. Profiling a patient's reactivity to stress may be an important addition to ambulatory measurements that are used for treatment decisions.

It is noteworthy that the physical stresses were designed to put substantial stress on the patient. The verbal interaction portion was structured as an exploratory interview. The mental stress component was designed to create performance pressure. Patient complaints about the strenuousness of the hand grip and discomfort induced by the cold pressor test were not systematically collected, but at least 50 percent complained about one or the other. Despite the intensity of the physical stresses, interview and mental stress, generally elicited higher blood pressure responses. We took this finding as additional evidence of the potent effect that interview and mental stresses have on blood pressure.

The situation or process of psychophysiological stress testing was found to be different from the office and ambulatory settings for the measured parameter of blood pressure. We believe the findings will support further research into the importance of the effect of interview and mental stress on blood pressure, particularly as they relate to "white-coat" hypertension.

ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

MARYLAND DIAGNOSTIC IMAGING CENTER

7120 Contee Road
Laurel, Maryland 20707

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

AXID®
nizatidine capsules

Brief Summary. Consult the package literature for complete information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to eight weeks of treatment. Most patients heal within four weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than one year are not known.

Contraindication: Known hypersensitivity to the drug. Use with caution in patients with hypersensitivity to other H_2-receptor antagonists.

Precautions: *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix® may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a two-generation, pennatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,900 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events was due to the drug.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to three times the upper limit of normal, however, did not significantly differ from that in placebo patients. Hepatitis and jaundice have been reported. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H_2-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H_2-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Because cross-sensitivity among this class has been observed, H_2-receptor antagonists should not be administered to those with a history of hypersensitivity to these agents. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance by approximately 84%.

Thrombolytic Therapy in MI: A Retrospective Study

Raul Balagtas MD, Juan Herrada MD, and Raymond Bahr MD

From the Paul Dudley White Coronary Care System, Department of Medicine, St. Agnes Hosiptal, Baltimore.

Of 123 patients with acute myocardial infarction, 82 percent did not receive thrombolytic therapy; 27 percent of those were because of time delays on patients' part in seeking medical attention. There is a clear need for patient education and public awareness of prodromal symptoms and early intervention.

It has been estimated that only a small percentage of cardiac failure patients with acute myocardial infarction (AMI) are candidates for thrombolytic therapy (estimates range from 20 percent to 30 percent of patients).

We undertook a retrospective analysis of the records of patients admitted to our coronary care who were diagnosed to have AMI during a three-month period. Included were patients with proved AMI with ST segment elevation with or without thrombolytic therapy.

Milestones

Recent years have borne witness to some remarkable milestones in coronary care. The elucidation of the pathophysiology of the coronary care syndromes by DeWood et al.[1] have provided a fresh perspective in the definitive management of coronary heart disease.

DeWood and his colleagues demonstrated the presence of coronary thrombosis (the so-called "culprit lesion") in at least 80 percent of patients who underwent coronary angiography within the first six hours of an acute "Q-wave" myocardial infarction. They also demonstrated that thrombi are present in 26 percent of patients with "non-Q wave" infarcts.[2] Sherman,[3] on the other hand, studied patients with unstable angina by coronary angioscopy and found that 70 percent of these patients had coronary thrombi.

A novel approach to the pathophysiologic management of the coronary syndromes was ushered in by the landmark study of Rentrop et al.[4,5] about ten years ago. Their study demonstrated the efficacy of intracoronary streptokinase in producing transluminal recanalization of coronary thrombi.

Since then, numerous clinical trials have been conducted to assess the efficacy and safety of thrombolytic therapy.[6-9] Foremost among them is the GISSI study (Gruppo Italiano per lo studio della streptochinasi nell'infarto miocardico)[7,10]that undertook the task of testing the efficacy and safety of intravenous (in contrast to

intracoronary) streptokinase under routine conditions in a large number of patients.

The GISSI study demonstrated a significant reduction (18 percent) in the 21-day mortality in streptokinase-treated patients as compared to the control group. Furthermore, the study concluded that the extent of beneficial effects appears to be a function of time from the onset of chest pain to the time of streptokinase infusion. They found relative risks (risk-to-benefit ratio) of 0:74 for the 0 to 3 hours subgroup; 0:80 risk for the 3 to 6 hours subgroup; 0:87 risk for the 6 to 9 hours subgroup; and 0:19 risk for the 9 to 12 hours subgroup.

These conclusions could be ascertained from the various studies:

- thrombolytic therapy is an effective mode of therapy for coronary syndromes.[5,6,9-11]
- the timing of administration of thrombolytic drugs is crucial for such drugs to have maximal efficacy with minimal side effects.

Thus, the so-called "golden period" of 30 minutes to 6 hours[5,10] from the onset of chest pain should be the main goal of thrombolytic therapy administration.

The purposes of our study were:

1. To determine the percentage of acute myocardial infarction (AMI) patients who present with ST-segment elevation and who eventually received thrombolytic therapy in the form of recombinant tissue plasminogen activator (rt-PA).
2. To determine the percentage of AMI patients who presented with ST-segment elevation but did not receive thrombolytic therapy because of time delay in the patients' consultation at the emergency room.
3. To determine the percentage of AMI patients who did not receive thrombolytic therapy because they did not present with ST-segment elevation.
4. To establish the necessity of identifying early AMI patients by other screening procedures so they may benefit from thrombolytic therapy.
5. To establish a Thrombolytic Index as a numerical means of comparing treatment data.

Methods

A retrospective analysis was performed over a three-month period (November 1988 to January 1989) by examining the hospital charts of patients admitted to the Coronary Care System of St. Agnes Hospital. These patients were admitted with a clinical suspicion of AMI.

Each chart was analyzed and the following data obtained: age, sex, creatine phosphokinase-myocardial band (CPK-MB), chief complaint on admission, admission electrocardiogram (ECG), reasons for/or contraindications to the administration of thrombolytic therapy (rt-PA). The number of patients diagnosed with definite AMI, the number of patients whose diagnosis of AMI was ruled out, the number of patients with AMI who received thrombolytic therapy (rt-PA), and the number of patients who did not receive thrombolytic therapy were tabulated.

The criteria for the diagnosis of AMI were:[5]

1. clinical history of chest pain of probable ischemic origin, unrelieved with sublingual nitroglycerin
2. ECG changes compatible with ischemia (that is, ST-segment elevation, ST-segment depression, new Q waves, or ST-T-wave changes)
3. creatine phosphokinase (CPK) elevation with CPK-MB fraction value greater than or equal to 10 percent of the total CPK value

The criteria for administration of thrombolytic therapy were[5] ischemic chest pain occurring for 20 minutes to 6 hours unrelieved by sublingual nitroglycerin; ST segment elevation $\geq$ 0.1 mV in two contiguous leads; and low risk for bleeding.

The contraindications for thrombolytic therapy were[5,12] acute internal hemorrhage, bleeding diathesis, history of cerebrovascular accident, major surgery or trauma within ten days, recent blood vessel puncture in a noncompressible site, traumatic cardiopulmonary resuscitation (CPR), uncontrolled hypertension with blood pressure > 180/110 mmHg, intracranial or intraspinal disease, and clouded sensorium.

Recombinant tissue plasminogen activator (rt-PA) was supplied in 50 mg vials. Two vials were reconstituted in 50 cc sterile water each and then diluted up to 1:5 in normal saline. A separate IV line as used for rt-PA. A 10 mg IV bolus was given over 1 to 2 minutes by a resident physician and followed by a 50 mg IV drip over the next 60 minutes. This was followed by a 20 mg/hour drip over two hours.

Results

A total of 123 patients were evaluated. Of these, 17 (14 percent) were less than 40 years old; 64 (52 percent) were in the 41 to 65 year-old range; and 42 patients (34 percent) were in the 66 to 85 age range. Of these patients, 53 (43 percent) were males and 70 (57 percent) were females.

With regard to the chief complaint, 66 (54 percent) of the patients presented with chest pain; 37 (30 percent) with shortness of breath; 10 (8 percent) with dizziness; and 5 (4 percent) with diaphoresis.

ECG findings of ST segment elevation of greater than 1 mm were present in 22 of 55 patients with documented AMI (40 percent). Other ECG findings of ST segment depression and nonspecific ST-T wave changes without any ST-segment elevation was present in 30 of 55 documented AMIs (55 percent). Findings consistent with left bundle branch block were found in 3 of 55 patients (5 percent).

Of the 123 patients, 55 had documented AMI (45 percent), and 68 patients (55 percent) had the diagnosis of AMI eventually ruled out.

Of the 55 patients with documented AMI, 10 (18 percent) qualified to receive thrombolytic therapy while 45 (55 percent) patients did not.

Of these 45 patients who did not receive rt-PA, 12

(27 percent) had ST segment elevation but did not receive thrombolytic therapy because of time delay (that is patient consultation occurred beyond 6 hours from the onset of chest pain); 30 out of 45 patients (67 percent) had no ST-segment elevation and therefore did not qualify to receive thrombolytic therapy; and 3 patients (7 percent) presented with left bundle branch block and did not qualify to receive thrombolytic therapy.

Discussion

We found in our study that 82 percent of the patients with proved AMI did not receive thrombolytic therapy.

Although 27 percent of the patients with AMI came in with ST segment elevation, they did not receive thrombolytic therapy because of time delay. These patients were evaluated and diagnosed as AMI beyond the "golden period" of the acknowledged criteria for the safe administration of thrombolytic therapy.

Several implications could be drawn from this observation:

The need for patient education and public awareness Time delays can occur due to the patient: his or her denial of symptoms or unawareness of the prodromal symptoms of myocardial infarction and the importance of early intervention in its management.[13] Patient education and public awareness of prodromal symptoms and of the importance of early intervention are important. Dissemination of information through the media or through community outreach programs could be of immense value. At Saint Agnes Hospital, a community program, "Early Cardiac Care Giver," promotes this concept of public awareness of coronary heart disease and its serious implications.

The early administration of thrombolytic therapy It is still controversial whether field administration of thrombolytic therapy through the Emergency Medical System (EMS)[14-18]with close hospital support would be a safe and effective way of providing early cardiac intervention. This could be of immense importance in the rural setting. Several studies have addressed this issue. One was a University of Chicago study[14]in which a cellular phone system was used to transmit ECGs from the ambulance to the hospital-based emergency room physician who made decisions based on the ECG and the patient history. These "mock decisions" were eventually compared with decisions made by other hospital personnel upon the patient's arrival in the hospital emergency room. Both decisions correlated well. This approach remains an attractive and viable solution.

The need for an early and accurate diagnosis of AMI ECG as a diagnostic tool has a low sensitivity and low specificity.[19]Serum CPK-MB determinations take too long to be a basis of decision making in diagnosing AMI patients with potential for the use of thrombolytic therapy.[20] Advances in technology could play a vital role in this regard. A faster method of detecting CPK-MB levels using fluorescent probe technology is being studied (akin to the technology employed in continuous 24-hour arterial blood gas monitoring). Other technological breakthroughs such as myoglobin level determination and two-dimensional radionuclide imaging using monoclonal antibody technology are on the horizon.

Expansion of the criteria for thrombolytic therapy Expanding the criteria for the administration of thrombolytic therapy to include unstable angina as one of the indications for its use is controversial. One has to weigh the risks and benefits including cost-effectiveness and safety. Studies such as the European International Study[1] noted an appreciable decline in mortality (26 percent) in patients who received thrombolytic therapy as compared to those who did not. The inclusion criteria in this study was based solely on the clinical history of prolonged chest pain of probable ischemic origin. Thus, this study indirectly points to the benefit that some patients with coronary artery disease might obtain from this modality, whether it be AMI or unstable angina.

It was proved that coronary thrombosis exists as the "culprit lesion" even in unstable angina, thus showing the effectiveness of heparin therapy in this setting.[3] It is therefore logical that thrombolytic therapy should benefit these patients as well. Further studies need to fully address this controversy.[21,22]

Thrombolytic Index

At this point, we introduce the concept of the "Thrombolytic Index" (TI). This corresponds to the percentage of patients who received thrombolytic therapy factored from the total number of patients admitted with a diagnosis of AMI. The equation is

$$\text{TI:} \frac{\text{patients with AMI receiving thrombolytic therapy}}{\text{total number of patients admitted with a proved diagnosis of AMI}}$$

In this study, the TI is 18 percent (10 patients who received thrombolytic therapy out of 55 patients admitted and diagnosed as having AMI during the same period of observation).

We believe this objective measure would facilitate accurate comparison of thrombolytic therapy statistics among various hospitals and would be a good gauge of how effectively thrombolytic therapy is administered in AMI. At present, based on clinical studies done so far[5,7] such TI value (or its equivalent in such studies) would fall in the 20 percent to 30 percent range. We would aim for a 100 percent value as this would mean we have extended the benefits of thrombolytic therapy to all patients with AMI. Further studies must be done to establish reasonable goals and expectations that hospitals can achieve.

Perhaps the main value of a thrombolytic index would lie in its role in monitoring the progress of the hospital's public awareness and community outreach

programs in disseminating the value of early recognition of the prodrome of AMI. A yearly comparison of TI could be an objective measure of how effectively those programs (and other proposed strategies) could improve the number of patients that might benefit from thrombolytic therapy.

Relevance of Routine Operative Cholangiograms and Modifications in Criteria for Selective Use

Dinesh Ranjan MD, Udayan B. Shah MD, and Thomas R. Molano MD

From the Department of Surgery, St. Agnes Hospital, Baltimore. Reprints: Udayan B. Shah MD, 900 Caton Ave., Baltimore, MD 21229.

A community hospital's experience in reviewing 367 patients undergoing cholecystectomy over one year showed that routine use of operative cholangiograms not only is unwarranted but also may be harmful.

Since its introduction in 1931 by Mirizzi, the operative cholangiogram (OC) justifiably has found a place in the repertoire of the general surgeon performing cholecystectomy. Use of the OC has saved unnecessary choledochostomies in approximately 50 to 60 percent of patients who would have undergone this procedure had the decision been based on clinical criteria alone.[1-4] However, in the past 10 to 15 years, other studies have been published denouncing the routine use of operative cholangiograms.[5-8] We report a retrospective review of our experience with routine OCs in a community hospital setting.

Methods

Charts of 367 patients who underwent cholecystectomy at St. Agnes Hospital from July 1985 through June 1986 were reviewed. Relevant information was charted on sheets that included patients' preoperative profiles with emphasis on preoperative criteria as accepted for selective use of operative cholangiogram (Table 1). We did not include intraoperative assessment of the common bile duct (CBD) in these criteria as very few operative notes indicated Kocherization of the duodenum prior to assessment of the CBD. Of the 367 patients, 74 were excluded from the study because either the cholecystectomy was incidental or no OC was performed. None of these patients have returned with complications.

Of the remaining 293 patients, 226 had negative OC, 2 had CBD exploration on basis of ERCP, and 65 had positive OC (dilatation and/or stone in CBD). Criteria of calling an OC positive were (1) radiolucent shadow in CBD or hepatic duct(s); (2) dilation alone of CBD without flow of contrast in duodenum. All patients with positive OC had two or more films taken, often with tilting or turning the table to eliminate artifacts or air bubbles.

Results

Of the 293 patients included in the study, 65 had positive OC by the above criteria, including 6 who had ductal dilation alone

(criterion 2). These 6 had had pancreatitis within the past two months and underwent exploration of CBD (CBDE) with bypass or sphincteroplasty. The remaining 59 had radiolucent shadows in biliary tree considered indicative of choledocholithiasis. Fifteen (25 percent) of them had OCs that were read as positive by the radiologist but considered negative by the surgeon; only one (1/15) of these underwent CBDE (which was negative), the remaining 14 did not undergo CBDE. None of these 15 have come back with complications.

False-positive results Of a total of 59 OCs suggesting choledocholithiasis, 45 underwent CBDE. Twenty-one of 45 (47 percent) had a positive exploration; the remaining 24 (53 percent) had a negative exploration. The number of false-positive interpretations by the radiologist was 38 out of 59 (64 percent). Of these 38, 23 also had been interpreted as positive by the surgeon. Thus, the surgeons disagreed with the interpretation by the radiologist in 14 of the 38 cases. Of the 38 false-positive OC interpretations, 21 had one or more of the criteria used for selecting the use of OC. Had the criterion of multiple stones been eliminated, there would have been only 15 false-positive interpretations resulting in the use of OC, and the negative exploration rate by OC would have been reduced to 33 percent (15/45).

True positive results Twenty-one (21) patients had a positive OC and a positive CBDE; of these, 4 were unsuspected using preoperative criteria. Of the remaining 17 patients with positive criteria for OC and CBDE, none had multiple stones as the only criterion.

False-negative results Two hundred twenty-six (226) out of 293 patients had a negative OC; of these 2 (0.8 percent) came back within 6 months with obstructive jaundice and had to undergo endoscopic sphincterotomy resulting in retrieval of a retained stone. Both these patients during their initial operation had indications for selective OC.

Unnecessary cholangiograms One hundred sixteen (116) patients out of 293 patients undergoing cholangiograms (40 percent) had one or more criteria (including multiple stones for performing selective OC); the remaining 60 percent did not.

Unsuspected stones Only four (4) of 117 patients (2.2 percent) were discovered to have cholelithiasis when cholangiograms were performed in patients who did not meet the criteria for OC.

Pancreatitis An analysis of different criteria in the three groups (Table 2) shows relative similarity between the false-positive OC and negative OC groups. An exception was that 31 percent of the false-positive OC patients had pancreatitis (or a recent history of it) versus only 4 percent in the negative OC group. The same patients also had mild dilatation of the CBD and an increase in alkaline phosphatase.

Table 1. Indications for Selective Operative Cholangiograms

1. Hyperbilirubinemia (direct bilirubin > 0.5, nl 25)
2. Increased alkaline phosphatase > 130 (nl 126)
3. Pancreatitis or hyperamylasemia
4. Dilated CBD on sonogram > 1.0 cm (nl 0.8 cm)
5. Multiple stones by sonography

Discussion

Although advantages of the OC over clinical criteria alone for evaluating the biliary tree are unquestionable, the low yield of unsuspected stones (2.2 percent in this series) does not justify routine use of OC in all cholecystectomies, especially as only 10 percent of the unsuspected stones are likely to become a clinical problem. The yield of unsuspected stones in different series varies from 0 to 3.9 percent (Table 3).[1-8]

The most disturbing fact in this study was the very high number of false-positive OC (64 percent by the radiologist and a somewhat lower number (30 percent) by the surgeon. This resulted in a negative exploration of the common bile duct in 53 percent of patients. The range of false-positive OC as reported in other series varies from 0 to 41 percent, with one study [7] reporting 46 percent false positive over one year, but 38 percent for the entire series. We could not find a report in other studies regarding a conflict between the radiologist and the surgeon, but from our experience it would appear that the surgeon is more likely to be right

Table 2. Analysis of Criteria

	CBD Stone (percent)	False-Positive OC (percent)	Negative OC (percent)
Increased direct bilirubin	82	37	30
Increased alk. phosphatase	52	26	9
Dilated CBD	52	29	6
Increased bilirubin, alk. phosphatase	41	7	7
Increased bilirubin, alk. phosphatase and dilated CBD	35	3	3
Pancreatitis	24	31	4

Table 3. Yield of Unsuspected Stones in Different Series (percents)

	False-Positive OC	Unsuspected Stone

8. Am J Surg 1988; 155: 540-45.

should such a conflict arise. This probably comes from the clinical involvement with the patient and the advantage of the intraoperative visualization and palpation of the biliary tree. The surgeon, therefore, should not feel pressured to explore the common duct based solely on a positive reading of an OC by the radiologist.

Since none of the patients with true positive OCs only had multiple stones as the criterion for selective OC, we think that multiple stones should not be included in the criteria. Indeed, excluding multiple stones from the criteria and then using OC selectively, the negative exploration rate would have been 33 percent instead of 58 percent without altering the number of unsuspected stones. Another study[7] quoted a false-positive rate of 85 percent when OC was done when the finding of multiple stones was the only criterion cited.

Thirty-one percent of the patients in the false-positive group had pancreatitis or had a recent history of it with increase in alkaline phosphatase and mild dilatation of the CBD versus only 4 percent of the negative OC group. It appears that alterations or distortions of anatomy during or soon after an attack of pancreatitis predisposes to a false-positive impression on a cholangiogram. Therefore, when interpreting the OC in these patients, the surgeon should be aware of the increased incidence of false positivity.

Conclusion

Routine use of OC is not only unwarranted but also may be harmful. The low yield of unsuspected stones does not justify its routine use. To decrease the number of false-positive cholangiograms, it appears that (1) it should be used selectively only; (2) multiple stones should not be included in the criteria for selective use of OC; (3) the surgeon should be aware of the high incidence of false-positive OC in patients with a history of pancreatitis; and (4) clinical judgment should be used at surgery to determine the use of OC.

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. Choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package designed and developed by the Computer Services Department at the Medical and Chirurgical Faculty of Maryland. Physicians were consulted at every stage of the applications development to insure an easy-to-use and well-designed system. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500-form billing, appointment scheduling, and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management offers:

- ☐ Appointment scheduler
- ☐ Aging
- ☐ Day sheet
- ☐ Menu driven
- ☐ On-line help manual
- ☐ Maintains patient demographics
- ☐ Insurance billing (1500 form)
- ☐ Walk-out superbill
- ☐ End-of-month bill
- ☐ Statistical reports
- ☐ Accounting reports
- ☐ Unlimited technical support
- ☐ Unlimited software upgrades
- ☐ Unlimited office staff training
- ☐ Automatic back-up and restore
- ☐ Separate ICD-9 and CPT code databases
- ☐ Multiple diagnosis and procedure transactions
- ☐ Password protection to sensitive areas
- ☐ No annual fee for Med Chi members
- ☐ Clinical demographics

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

Management Systems, Inc.
Will Speed Up Your Billing
And "Cure" Ailing Accounts

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

Management Systems, Inc.'s
"Computer-Side Manner" Is
The Best

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

Use of Fetal-Weight Formulae in a Community Hospital

James Castellano MD, Marlene Eichner RDMS, John D. Dumler MD, and Pedro P. Arrabal MD

From the Department of Obstetrics and Gynecology, St. Agnes Hospital.
Reprints: James Castellano MD, St. Agnes Hospital, 900 Caton Ave., Baltimore, MD 21229.

Twelve formulae for estimating fetal weight were prospectively studied in the hope that one formula could be used on a patient population regardless of such complications as oligohydramnios, multiple pregnancy, or abnormal presentation.

Fetal weight may be determined by using a number of published formulae incorporating a combination of biparietal diameter (BPD), abdominal circumference (AC), femur length (FL), and head circumference (HC). Difficulty in estimating fetal weight is compounded when the interval between sonography and delivery varies by days to weeks.

At present the incorporation of various fetal measurements into formulae have been extremely useful in providing accurate information regarding fetal weight. After several years' experience using the formula of Shepard et al.[1] for estimating fetal weight, we were reluctant to rely on the results when dealing with difficult clinical decisions concerning viability or method of delivery. Our impression was that we were underestimating the fetal weight by about 15 percent for our patient population, even when delivery was within a short time after ultrasound examination. Therefore, a prospective study using Shepard's formula and Shepard's formula plus 15 percent was initiated. Other formulae published in the literature as listed in the Table were included in the study.[1-8]

In comparing these 12 twelve formulae it was hoped that one formula could be used on our patient population regardless of such complications as oligohydramnios, multiple pregnancy, or abnormal presentation. In addition, we aimed to determine whether instituting a factor to compensate for the time between delivery and ultrasonic evaluation would improve the predictive value of these formulae.

We also endeavored to evaluate whether the use of head circumference (HC) and femur length (FL) included in the formulae, in addition to the use of biparietal diameter (BPD) and abdominal circumference (AC), improved the accuracy as described by Hadlock et al.[8,9]

Material and Methods

The study consisted of 226 patients examined by one of the authors (ME) by means of a linear array real-time scan (ADR-4000 SL, 3.5 MHz transducer). Measurements were made with

electronic calipers. The population consisted of all racial groups and included both private and service patients. The population was unselected and included preterm, term, and postterm fetuses, as well as fetuses that were growth retarded or macrosomic. Since Deter et al.[10] found no significant difference in fetal-weight growth curves, no separation by fetal sex was attempted. Gestational ages varied between 20 and 44 weeks. Gestational age at delivery was determined by using the expected date of confinement (EDC) by last menstrual period if it was normal and if it was consistent with Dubowitz scoring. If the last menstrual period was unknown or thought to be in error, the gestational age was determined by averaging the EDC determined by the published formula of the BPD, HC, AC, and FL, and confirmed by Dubowitz scoring. The study was divided into groups of four weeks by gestational age since gestational age is either known or estimated by the clinician and thus was thought to be of most value for decision making in the delivery suite.

The biparietal diameter was obtained at the level of the thalmi and the septum pellucidum. Measurements were made from the outer edge of the anterior skull table to the outer edge of the posterior skull table, and a perpendicular measurement to that line from outer edge to outer edge. The two measurements were added, divided by two and multiplied by pi, except in formula 4.

The abdominal circumference was measured by determining the fetal lie using the fetal aorta or spine. A symmetrical circular abdominal echo was sought as best possible at a right angle to these structures at the level of the umbilical vein. If the umbilical vein could not be visualized, the level of disappearance of fetal cardiac echos and appearance of the fetal stomach was used. The anterior and posterior diameter of the abdomen was then measured by the electronic calipers from outer skin surface to outer skin surface through the spine posteriorly. The transverse abdominal diameter was measured at right angles to the above. This circumference was calculated in the same manner as the head circumference.

The femur length was obtained by measurement of the diaphysis from the proximal to the distal metaphysis, as described by O'Brien and Queenan.[11]

The results of the study were analyzed by comparing the 12 formulae as follows:

1. The error obtained in either underestimating or overestimating the fetal weight, that is, the actual weight (AW) minus the predicted weight (PW).
2. The absolute error, that is, the gross error whether due to overestimation or underestimation.
3. The error percentage, that is, the error of percent equals [(AW-PW)/AW] x 100.
4. The grams per kilogram error [{AW-PW}/{AW/1000}].
5. Attempts were made to further refine the comparison of the 12 formulae by adding 10 grams per kilogram and 25 grams per kilogram to the predicted weight for each day that the delivery occurred after ultrasound examination. This was based on Hendricks' study[12] reviewing a fetal growth pattern of 20 to 30 grams per kilogram per day and Williams et al.[13] who reported the median growth rate reaches a maximum of 250 grams per

Table. Formulae Used to Predict Fetal Weight

1. Log_{10} Wgt. = -1.7492 + 0.166 X BPD + 0.046 X AC -2.646 X (AC X BPD)/1000.[1]
2. Wgt. = Formula (1) + Formula (1) X 0.15.
3. Wgt. = Formula (1) + Formula (1) X 0.124.[2]
4. Log_{10} Wgt. = -1.7492 + 0.166 X BPD + 0.046 X Pi $\frac{X / \frac{(FAD_1)^2 + (FAD_2)^2}{2}}{X / \frac{(FAD_1)2 + (FAD_2)2}{2}}$ -0.002646 X Pi X BPD.[3]
5. Log_{10} Wgt. = -1.599 + 0.144 X BPD + 0.032 X AC - 0.111 X ($AC \times BPD^2$) /1000.[4]
6. Wgt. = 0.0816 X AC3.[5]
7. Wgt. = (BPD X AC X 9.337) - 299.076.[6]
8. Wgt. = 10.1 X (AC X BPD) - 481.[7]
9. Log_{10} Wgt. = 1.304 + 0.05281 X AC + 0.1938 X FL -0.004 X AC X FL.[8]
10. Log_{10} Wgt. = 1.335 - 0.0034 X AC X FL + 0.0316 X BPD +0.0457 X AC + 0.1623 X FL.[8]
11. Log_{10} Wgt. = 1.326 - 0.00326 X AC X FL + 0.0107 X HC +0.0438 X AC + 0.158 X FL.[8]
12. Log_{10} Wgt. = 1.3596 - 0.00386 X AC X FL + 0.0064 X HC +0.00061 X AC X BPD + 0.0424 X AC + 0.174 X FL.[8]

week at 33 weeks and then declines to approximately 75 grams per week at 40 weeks.

6. An attempt also was made to remove the cases with method errors (those cases in which two-thirds of the formulae produced an error of greater than 10 percent) to further compare the accuracy of the formulae. In addition, this subgroup of cases was adjusted by 10 and 25 grams per kilogram per day to further evaluate whether this correction improved predictive results.
7. Those cases of oligohydramnios or premature rupture of the membranes (PROM), abnormal presentations, and twins were then considered separately to evaluate the comparative value of the formulae in these special cases.

Results

The first group consisted of 30 patients who were 36 weeks' gestation or more and delivered within 3 days of their real-time scan. This resulted in fairly accurate predictions by many of the formulae. Formula 10 was within 5 percent on average, with formulae 9 and 12 close behind, as well as formulae 1, 4, and 11. Elimination of those cases with excessive method error, as well as correction for 10 to 25 grams per kilogram per day after real-time scan made little difference in the accuracy of these formulae.

Group two deals with those patients 36 weeks' gestation or greater who delivered 4 to 7 days after the real-time scan when accuracy deteriorates to a certain extent. There is a 7 percent difference in formula 3 closely followed by formulae 1, 2, 4, 9, 10, 11, and 12. Eliminating method errors reduced the caseload from 26 to 20. The addition of 10 grams per kilogram per day from the time of ultrasound to the time of delivery only reduced the cases from 26 to 24. It therefore appears that the addition of 10 grams per kilogram per day is of some benefit in cases that deliver 3 to 7 days after ultrasound. When dealing with patients who deliver 8 or more days after ultrasound, as is studied in the third group, it can be seen that accuracy deteriorates even further.

In summarizing cases above 36 weeks gestation, it appears that formulae 4, 10, 11, and 12 are probably the most accurate, with formulae 1, 9, and 6 very close behind. It also appears that the addition of 10 grams per kilogram per day from the day of scan to the date of delivery is somewhat helpful in predicting birthweights.

Patients 32 to 36 weeks' gestation are dealt with next in three groups. Group four concerns itself with patients who delivered within 3 days after the real-time scan. All formulae resulted in rather poor accuracy with an average error of about 9 percent, improving only to 7 percent by removing the method errors. The addition of 10 and 25 grams per kilogram per day did not improve the accuracy of the interpretation nor did it salvage the cases lost due to method error. No particular formula was outstanding in this group of patients.

In those patients who were 32 to 36 weeks' gestation and delivered between 4 and 7 days after real-time scan (group five) there was again no great accuracy in any of the formulae. Formulae 4, 9, and 10 did better than the rest, with formulae 1, 11, and 12 close behind. The addition of 10 grams per kilogram per day improved most of the formulae slightly, as did the addition of 25 grams per kilogram per day. The elimination of method errors, plus the addition of 10 and 25 grams per day, improved the performance in formulae 1, 4, 5, 9, 10, 11, and 12, but this is based on only 10 cases.

The sixth group deals with the patients 32 to 36 weeks' gestation who delivered 8 or more days after their real-time scan, and the only formulae that have less than 10 percent error are 2 and 3. Correction of method errors reduces the number of cases to less than half, but the addition of 10 grams per kilogram per day salvages 6 of the 7. Once again, it appears that the elimination of method errors enhances the accuracy of formulae 1, 4, 9, 10, 11, and 12, as does the addition of 10 grams per kilogram per day.

Groups seven and eight pertain to patients who delivered between 28 and 32 weeks. There are not enough cases in this group of patients who delivered 8 or more days after real-time scan to list. In fact, there were only 7 patients who delivered between 4 and 7 days after real-time scan, which are considered in group eight.

Group seven considers those patients who are 28 to 32 weeks and delivered within 3 days after real-time scan. Again the raw results seem to be less accurate than with the more mature fetuses. There were no formulae under 5 percent error. Only formulae 9, 10, 11, and 12 were under 10 percent. Correction by 10 grams per kilogram per day reveals practically no difference, and correction by 25 grams per kilogram per day made the situation worse. Elimination of cases with excessive method error reduced the caseload from 30 to 18, but brought formulae 10, 11, and 12 to less than 5 percent and all formulae except 5 and 6 under 10 percent. The addition of 10 grams per kilogram per day to these corrected cases did not improve the accuracy, and 25 grams per kilogram per day made it considerably worse.

Group eight, those patients 28 to 32 weeks, consists of only 7 cases. The correction of 20 grams per kilogram per day brought formulae 1, 4, and 8 under 10 percent, along with formula 7, whereas 25 grams per kilogram per day brought all the formulae above 10 percent error. Removing cases with method errors reduced the caseload by two. In dealing with the 5 cases in which the method of error was removed, the accuracy was improved markedly in formulae 12 and 9, as well as 10 and 11. The addition of 10 grams per kilogram per day helped most of the formulae, but the addition of 25 grams per kilogram per day caused deterioration of most of the formulae.

Those patients 24 to 28 weeks who delivered within 3 days after real-time scan are depicted in group nine. There were not enough cases delivering 4 days or more

after the scans for evaluation. Once again, formulae 9, 10, 11, and 12 functioned best, although their accuracy was just below a 10 percent error on average. After correction for method errors, the average error dropped to 5 percent or less. Eliminating the cases of method error in this group improved the accuracy of all the formulae. The addition of 10 grams per kilogram per day made little difference, and again, 25 grams per kilogram per day made the results worse.

Patients who are 20 to 24 weeks gestation and who have delivered within 3 days after real-time scan are in group ten. Again, there were not enough cases who delivered four or more days after real-time scan to include in this study. This segment of patients conforms to the results shown in the more mature cases. In this group of patients formulae 1, 4, 5, 9, 10, 11, and 12 seem to be best, but still have poor accuracy. The addition of 10 grams per kilogram per day made very little difference, as did 25 grams per kilogram per day. Elimination of method errors dropped the caseload from 25 to 22, and the addition of 10 and 25 grams per kilogram per day further reduced the caseload. The elimination of the method errors brought formulae 10 and 12 into a reasonably accurate estimation of fetal weights. It therefore appears that formulae 10 and 12 are probably the best, with 11, 1, 4, 5, and 9 also satisfactory.

It was decided to look at twins separately, and 20 fetuses (10 patients) are included in the eleventh group. It appears the results are essentially the same, in that formulae 1, 4, 10, 11, and 12 all seem to be superior to the other formulae. The addition of 10 grams or 25 grams or the elimination of method errors seems to make little difference in this group.

We next considered breech pregnancies at 30 weeks or more (group twelve), breech pregnancies 30 weeks or less (group thirteen), oligohydramnios 30 weeks or more (group fourteen), oligohydramnios 30 weeks or less (group fifteen).

Group twelve contains the material on breech pregnancies 30 weeks or more who delivered within 3 days after real-time scan. It appears that formulae 2 and 3 are slightly more valuable in this subset of patients, but again, 9, 10, 11, and 12 performed well. There seem to be little benefit in adding 10 grams or 25 grams per kilogram a day. There was marked improvement with elimination of method error, but unfortunately there were many method errors, which reduced the caseload to less than half.

The thirteenth group contained breeches less than 30 weeks gestation, and in this particular subset of 9 patients the performance of formulae 2 and 3 did not hold up, and once again, formulae 1, 4, 9, 10, 11, and 12 proved to be superior. There were no cases with gross method error, and the addition of 10 and 25 grams per kilogram made no change in the results.

Group fourteen is made up of patients who have oligohydramnios 30 weeks or more gestation, regardless of presentation who delivered within 3 days after real-time scan. This again seems to maintain the pattern that the same formulae are fairly accurate in comparison to others. In this particular case, formulae 10, 11, and 12 are best with 9, 1, and 4 following. Formula 3, which is reported to be useful in premature rupture of the membranes, does perform well, but not quite as well as formulae 10, 11, or 12. Formula 2, again, fails to meet the performance of the above-mentioned formulae. The addition of 10 and 25 grams per kilogram to the estimated weights, whether using raw figures or figures corrected for method errors, seems to make little difference.

Group fifteen consists of 12 cases of patients with oligohydramnios less than 30 weeks who delivered within 3 days after real-time scan. Although less accurate than with the larger babies, formulae 9, 10, 11, and 12 seem to perform better than the others. Adding 10 or 25 grams does not seem to make any difference. However, eliminating the method errors and reducing it to 8 cases improves the accuracy, as one would expect. The addition of both 10 and 25 grams seems to improve the accuracy even more, but the sample is so small it is difficult to draw a conclusion.

Summary and Conclusions

It appears, for our population at least, that any one of six of the formulae (1, 4, 9, 10, 11, and 12), are satisfactory for use in estimating fetal weight in all gestational age groups from 20 weeks on. In an overall review, formula 12 seems to predict slightly better than the others. Formula 12 functioned as well, if not better, than all formulae, except in the case of twins and breeches of 30 weeks gestation or less. Despite this, the performance of formula 12 in these two categories was excellent. Therefore, one can conclude that the use of the femur length and head circumference, along with the biparietal diameter and abdominal circumference in the weight formula produces the best results. In a like manner, formula 11, making use of the HC, AC, and FL, yielded results almost as good as formula 12 and proved to be quite useful. Formula 10, making use of the BPD, AC, and FL, functioned third best, but fell off slightly in twins, breeches after 30 weeks, and breeches less than 30 weeks with oligohydramnios.

We therefore would recommend formula 12 for general use. Formula 9 should be very useful if head measurements are difficult to obtain, and formulae 1 or 4 should be quite useful if accurate femur lengths cannot be obtained.

Formula 2, our addition of 15 percent to formula 1, proved to be of no value at all and should not be considered. Formula 4 does have value in fetuses of less than 1500 grams,[3] but still is not generally as accurate as those that measure the femur length and head circumference along with the other parameters. Formula 7 proved disappointing when compared to formulae 9, 10, 11, and 12 in patients below 34 weeks.[6] Likewise, formula 8 functioned poorly for fetuses less than 2000 grams[7] in our study.

The addition of 10 grams per kilogram per day seems to be of some use in improving accuracy of prediction

of weight of those fetuses who were 28 weeks or greater and in oligohydramnios under 30 weeks. However, the number of cases of the latter represent a small sample. It is also doubtful whether the improvement is worth the effort, and in general, the addition of 10 grams per kilogram per day from the day of the scan to the date of delivery would seem to be of little value. The addition of 25 grams per kilogram per day was of no value, other than in a small sample of oligohydramnios less than 30 weeks, and at times it was detrimental to the results.

Formula 9 was close behind formulae 10, 11, and 12 except in twins, and despite this it predicted fairly well with twins. The importance of this is that Formula 9 makes use of femur length and abdominal circumference only, functioned quite satisfactorily in all but breeches and twins, where they did not function quite as well as the formulae listed above.

In summary, our findings suggest the following:

1. The estimation of fetal weight is enhanced by the addition of femur length to head and abdominal measurements as described by Hadlock et al.[8]
2. The use of head circumference along with abdominal circumference and femur length is equally as accurate as the combined use of biparietal diameter, head circumference, abdominal circumference, and femur length.
3. The use of head circumference is slightly superior to the biparietal diameter when either is combined with femur length and abdominal circumference.
4. When the head is not accessible for measurement, the formula incorporating only the femur length and abdominal circumference provides acceptable results.
5. Addition of 10 grams per kilogram per day for each day from ultrasound examination to delivery seems to be of some use in improving accuracy of weight prediction for those fetuses who were 28 weeks or greater.
6. The addition of 25 grams per kilogram per day was of no value.

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service.* Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

"I have first-hand knowledge of the level of professionalism of Meridian's staff and maintenance of their facilities. I feel the staff is very interested, warm, and sensitive to the needs of the residents."

Theodore C. Patterson, M.D.
Medical Director,
Meridian Nursing Center—Heritage

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including the many sub-acute care services available at our Multi-Medical facility. Or our special Alzheimer unit (operated in consultation with The Johns Hopkins Medical Institutions) now in its fourth year at our Dundalk center. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

MERIDIAN

Case Report: Adult Scurvy

Anand P. Jillella MD; Eugene T. Finan MD; Zahid W. Butt MD; Mary E. Wright RD, LD; and David Strobel MD

From the Department of Internal Medicine, St. Agnes Hospital, Baltimore.

Adult scurvy, a rare condition in the United States (incidence 1:100,000), often is not recognized because of its rarity and diverse clinical manifestations.

Scurvy is seen occasionally despite improved standards of living and availability of food. Those frequently affected are people living alone and alcoholics. Scurvy often is not recognized by physicians because of its rarity and diverse clinical manifestations. Since diagnosis depends on a good history and physical examination, familiarity with risk factors and clinical manifestations of scurvy can increase the chances of diagnosis. We report a case of scurvy in a patient whose diet was extremely deficient in ascorbic acid.

Case Report

A 54-year-old white male presented with a two-week history of reddish discoloration of the skin on the anterior aspects of both legs. The discoloration started as circular spots, 5 cm in diameter and progressively increased in size to involve the entire lateral aspects of both legs. The patient noticed a similar discoloration on his left forearm. There were multiple red circular spots, 3 mm in size over the anterior aspects of both thighs. Associated symptoms included bleeding gums (especially while eating), lethargy, weakness, and dizziness. There was no history of trauma, upper respiratory tract infection, fever, headache, syncope, or joint pains.

He was an alcoholic of 20 years' duration and claimed to have lost some weight in the last month. He had smoked two packs of cigarettes per day for 35 years and was not taking any medications.

Physical examination revealed a blood pressure of 92/50 mm Hg with no orthostatic changes, a pulse of 90/minute, and a temperature of 99.0°F. There was a mild icterus. The upper jaw was edentulous, and the lower jaw showed poor dental hygiene and bleeding gums. The spleen was palpable 3 cm below the left costal margin. There was no free fluid in the abdominal cavity. The lower extremities revealed large ecchymoses on the lateral aspects of both legs. The skin was dry and there was mild ankle edema. There were multiple nonpalpable purpuric areas on the anterior aspects of both thighs. The left forearm had four ecchymotic areas each approximately 5 cm in size.

Laboratory values on admission included WBC 7,800,

hematocrit 44%, platelets 157,000, prothrombin time 12/s, partial thromboplastin time 31/s, total bilirubin 2.8 mg/dl (direct 1.3 mg/dl, indirect 1.5 mg/dl), sodium 122 mEq/L, mild protein uria, and normal LDH, SGPT, and SGOT.

Initial diagnostic considerations were bleeding secondary to hematologic abnormalities, vasculitis, and scurvy. Further evaluation for metabolic abnormalities and vasculitis was unremarkable. Subsequent dietary history revealed that the patient had consumed only alcohol and tea for the past month. The last time he had eaten citrus fruit was three months before. A serum ascorbic acid level was drawn, measuring 0.1 mg/dl (normal 0.6 - 2 mg/dl). The patient was placed empirically on ascorbic acid, and when examined two weeks later, he showed marked improvement with no evidence of new bleeding.

Comment

Adult scurvy usually presents with fatigue, weight loss, bleeding gums, discoloration of the lower extremities, pedal edema, and tenderness in the ankles. The petechiae, purpura, and ecchymoses suggest bleeding disorders due to platelet or coagulation abnormalities. The swollen ankles with hyperpigmentation often lead to consideration of conditions such as cellulitis and deep venous thrombosis.

The most important clues for early diagnosis are seen in the skin. The classic sign is a hyperkeratotic hair follicle with perifollicular bleeding. Because of abnormalities in keratin formation, the hairs become deformed (corkscrew deformity and swan neck deformity).[1] The prominent clinical manifestations (subcutaneous and mucosal bleeding) are due to degeneration of connective tissue within vessel walls.[2] Ascorbate is required as a cofactor for the enzymes prolyl and lysl-hydroxylase in the hydroxylation of proline and lysine residues in the pro-alpha chains of collagen. The defective collagen synthesized in the absence of ascorbate results in breakdown of connective tissue in vessel walls, perivascular areas, and keratin.[1]

Seventy-five percent of patients with scurvy are anemic. Factors leading to anemia include blood loss into tissues, blood loss via the gut, hemolysis, dietary deficiency, and deranged folate and iron metabolism. Ascorbate enhances iron absorption by reducing it from the ferric form to the ferrous form. Hypotension due to direct myocardial damage and inability of resistance vessels too constrict in response to adrenergic stimuli is seen in scorbutic patients.[1] Psychological changes in the form of hysteria, depression, and hypochondriasis are common.

Treatment consists of ascorbic acid supplements at 300 to 500 mg per day orally until 4g is administered. The total body pool of vitamin C varies from 1.5g to 3g.[3] Patients respond dramatically. Maintenance dosage of 100 mg per day for three to four months replenishes the body's store of the vitamin.[4]

Those at greatest risk for scurvy are alcoholic, schizophrenic, or elderly men living alone.[5] These individuals often cook for themselves or eat in restaurants and do not include foods rich in vitamin C in their diet. Further management consists of educating the patient about selection of a diet rich in vitamin C.

Case Report: Lateral Lumbar Synovial Cyst Computed Tomography Diagnosis

John N. Joslyn MD and Henry M. Shuey, Jr., MD

Dr. Joslyn is a member of the Department of Radiology and Dr. Shuey is a member of the Department of Neurosurgery of St. Agnes Hospital, Baltimore.

A symptomatic synovial cyst was preoperatively misdiagnosed because of its lateral location. This case illustrates another lesion to include in the differential diagnosis of masses lateral to the neural foramen in the lumbar spine in patients with degenerative facet arthritis.

Lumbar ganglion and synovial cysts are recognized causes of lower back pain with or without radiculopathy.[1-3] Since the advent of Computed Tomography (CT) and magnetic resonance (MR) scanning, their diagnosis has become more common. The true incidence of these lesions is not well established.[4] The lesions have a nonspecific myelographic appearance but a characteristic CT pattern. Over an 18-month period, four symptomatic synovial cysts were diagnosed and operated on at St. Agnes Hospital. One of these lesions was misdiagnosed preoperatively because of its lateral location. To our knowledge, this CT finding has not been described.

Case Report

The patient, a 64-year-old farmer with a nine-month history of back pain originally with a right sciatica now resolved, complained of back pain with a left sciatica. There were painful paresthesias into the left leg down to his ankle and numbness into his foot. He complained of focal numbness in the medial aspect of his left calf.

Physical examination demonstrated restricted straight leg raising 75 percent of normal, which does not aggravate pain, with minus one dorsiflexion EHL weakness and trace quadriceps weakness left only. His knee jerks were 2+ right and 1+ left with equal ankle jerks and numbness in the medial aspect of his left calf to pinprick, suggestive of an L4 dermatome.

A CT scan (Figure 1) revealed a soft tissue mass lateral to the left L4-5 neural foramen that was thought to represent a neurilemmoma or lateral disc herniation. Subsequent myelogram revealed no abnormal mass within the spinal canal. The lateral lesion was not demonstrated on myelogram. A microlumbar hemilaminectomy of L4 with left L4-5 facetectomy and left L4-5 inferior foraminotomy with excision of tumor of L4 nerve root dorsal laterally was done. The tumor was a cyst that was dorsal lateral to the L4 root adherent but not involving the nerve root without any attachment to the joint capsule noted.

Pathology revealed a synovial connective tissue fibrin-walled mucin-containing cyst consistent with juxta-articular ganglion. The patient recovered from his painful syndrome and resolved his neurologic deficits postoperatively.

Discussion

The terms synovial cyst and ganglion cyst will be used interchangeably. Pathologically, a synovial cyst represents a synovial lined cyst that communicates with the facet joint and results from proliferation of the synovium in response to chronic irritation or herniation of synovium through a capsular tear.[4,5] A ganglion cyst does not have a synovial lining, is not connected to the facet joint, and is filled with myxoid material. It is not clear whether a ganglion cyst arises from myxoid degeneration of a synovial cyst or whether it represents a separate entity.[6] Neither can be distinguished from the other on CT scanning, and both are associated with degenerative facet arthritis. On CT scanning, a lumbar synovial cyst (Figure 2) appears as an epidural soft tissue mass contiguous with an arthritic facet joint.[2,4] Rim calcifications may be present. Gas from a vacuum facet may be located within the cyst.[7,8]

Figure 1. CT scan of the L4-5 disc space. Note the rounded soft tissue density mass (arrow heads) lateral to the neural foramen. Also note the degenerative arthritic changes in the facet joints.

Symptomatology may be confusing in patients with lumbar synovial cysts. Because facet arthritis is always present, most synovial cysts are secondary findings to the patient's underlying facet arthropathy. Only when these cysts compress adjacent nerve roots are the cysts themselves symptomatic. Many synovial cysts are located dorsal to the facet and therefore could not compress the nerve root.[5] It is well documented by follow-up CT scanning that synovial cysts can spontaneously resolve.[4] Percutaneous corticosteroid injection has been successfully used to treat synovial cysts with and without radiculopathy.[9] Nearly 90 percent of lumbar synovial cysts are located at the L4-5 level. This is attributed to the fact that the L4-5 disc space is the most mobile and the level most associated with degenerative arthritis in the lumbar spine. Synovial cysts also have been reported at L5-S1 and L3-4.[1] Conservative therapy or perhaps steroid injection would be a reasonable initial therapy when a synovial cyst is diagnosed. Only after failure to improve would surgery be planned.

Our case posed a problem because the diagnosis was not made preoperatively. Differential diagnosis of the mass lateral to the neural foramen would include a nerve root tumor and a lateral herniated disc fragment as a more likely diagnosis although degenerative facet arthritis was present (Figure 1). The fact the cyst did not communicate with the facet joint further clouded the diagnosis. As mentioned, the cyst need not com-

municate with the facet joint even though it may have originated from the joint.

This case illustrates another lesion to include in the differential diagnosis of masses lateral to the neural foramen in the lumbar spine in patients with degenerative facet arthritis.

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-in format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.
Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

Case Report: Thyrotoxic Periodic Paralysis

George D. Lawrence MD, Eric Chwa MD, and Raul Balagtas MD

From the Department of Medicine, St. Agnes Hospital, Baltimore.

Periodic flaccid paralysis of skeletal muscle occurring in a thyrotoxic patient, an unusual and dramatic event, is seen predominantly in Oriental men. It is important to remember the clinical association between periodic paralysis and thyrotoxicosis.

A 43-year old Oriental physician was admitted to the Medical Intensive Care Unit at St. Agnes Hospital with a chief complaint of an inability to move his lower extremities.

The night before admission, the patient had gone to bed at 9 pm. At midnight, he awoke with "muscle aches" in both thighs. He also had mild weakness but was able to get out of bed and descend a flight of stairs holding onto a handrail for support. After about one hour of no change in his weakness, he ate a snack of waffles with blueberry syrup and went back to bed. Upon awakening in the morning, he experienced intense weakness of his lower extremities and mild weakness of his upper extremities.

Over the course of the preceding year, once every month or two, this patient had noted similar but less severe episodes on awakening. These attacks were noted to follow heavy meals of carbohydrates (usually fruit cake and candy) consumed the night before. There was no vomiting or diarrhea.

Past medical history was negative for any previous medical or surgical problems. He was not on any diuretics or other medications. There was no family history for thyroid disease or similar muscle symptoms. His father was Chinese and his mother was Filipino.

Review of systems was negative for any symptoms or signs of thyrotoxicosis: weight loss, heat intolerance, palpitations, tremulousness, goiter, exophthalmos, or weakness other than during the episodes described above.

Physical examination revealed a somewhat restless and apprehensive man. Height was 5'2", weight 155 lbs. Blood pressure was 140/70 mm Hg. Pulse was 100 beats/minute, respirations were 18 per/minute, T = 98.6°F . There was no exophthalmos, lid lag, or thyroid enlargement. The remainder of the general examination was normal.

Neurological examination initially was positive for severe weakness of the proximal muscles of the lower extremities and slight weakness of the upper extremities. He was unable to lift his legs while in the supine position. There was no evidence of fasiculations or atrophy. Tendon reflexes were absent. Muscle tone was diminished. Cranial nerve and sensory examinations were normal.

Serum potassium (K^+) was 2.0 meq/1 (3.5-5.5); CBC, BUN, creatinine, CPK, and other general laboratory studies were normal. EKG revealed sinus tachycardia and a prolonged QT interval (no u waves were seen) of 0.48 seconds (normal less than 0.35).

An initial consideration was Landry's Guillian-Barré Syndrome. However, a lumbar puncture was normal.

A total of 115 meq KCl was administered over an 8 hr period; 80 meq orally by liquid and 35 meq intravenously along with 5% dextrose and one-half normal saline. Muscle weakness completely resolved approximately 6 hrs after initiation of KCl therapy. Tendon reflexes returned to normal. Eight hours after beginning KCl, serum K^+ revealed an elevated value of 6.0 meq/l. Subsequently, serum K^+ levels returned to normal (Figure 1).

Thyrotoxicosis was considered because of the presence of hypokalemia and the history of periodic weakness occurring in an Oriental man.

Thyroid studies (Table 1) were performed and confirmed the diagnosis of thyrotoxicosis due to diffuse toxic goiter. Serum glucose, insulin and K^+ values after 100 gm of glucose tolerance test are also recorded in Table 1. No muscle symptoms or electrocardiographic changes were noted during that test. The patient was discharged from the hospital 28 hours after admission.

As an outpatient, he was given propranolol 60 mg/day and 13.6 millicuries of radioactive I-131. Three months following I-131 therapy, he developed symptoms of hypothyroidism including easy fatigability, cold intolerance, puffiness, and hoarseness. Thyroid stimulating hormone (TSH) was elevated to 26 uU/ml (0.4-3.8) with a thyroxine (T4) of 8.1 ug/dl (4.5-12.0). Propranolol was discontinued. He was begun on L-thyroxine replacement therapy and has since been asymptomatic.

Discussion

Thyrotoxic periodic paralysis (TPP) initially was described by Charcot and Mobius in the latter part of the nineteenth century.[1] Since then, there have been a number of reports describing this unusual association, most frequently noted in Orientals;[2,3] 90 percent of the patients reported in the literature are from Asia. The incidence of periodic paralysis in Japanese and Chinese patients who have thyrotoxicosis is 2 percent. The disorder is more often noted in males; the incidence of periodic paralysis in thyrotoxic males is 8 percent while it is only 0.4 percent in thyrotoxic females. Reports of TPP occurring in other ethnic groups are rare.

McFadzean and Yeung[3] studied 25 Chinese patients with TPP, and their findings are typical for what generally has been reported. Muscle attacks occur most often after the patient retires at night and are variable in their severity. Often premonitory symptoms of muscle aching and weakness start in the lower extremities, but these symptoms may improve with light exercise. The intensity of the weakness may progress in severity to a full symmetric flaccid paralysis, usually involving the muscles of the pelvic girdle. Subsequent spreading of weakness can occur and commonly involves the muscles from the neck down. The extensor musculature is more involved than the flexor musculature. A recent ingestion of a large carbohydrate meal and/or vigorous exercise is usual. The muscles of respiration, speech, and swallowing often are spared, as are the cranial nerves and the sensory nervous system. Asymmetric paralysis may occur in muscles that have been particularly over-

.5 hour	238	39	5.1*
1 hour	263	279	4.0
1.5 hour	222	369	3.7
2 hour	172	241	3.8

* Specimen hemolyzed.

worked. Recovery of muscle power occurs spontaneously within hours, but may be delayed for days. Muscles have been described as being tender during and shortly after the attack. Tendon reflexes are depressed during paralysis.

An attack of flaccid paralysis can be provoked by the administration of glucose (100 gms or more orally is needed) or glucose and insulin. Inducing an attack for diagnostic purposes is successful in most patients, but more than one attempt may be necessary and should be done with electrocardiographic monitoring. Serum K^+ levels invariably decrease from baseline values (mean fall of 1.2 SD 0.4 meq/1) and in most patients to below the normal range. Increased severity of muscle paralysis correlates with the lowest serum K^+ levels. There is a concomitant fall in urinary excretion of K^+ and no change in fecal K^+ during a paralytic episode. The fall in serum K^+ is due to a redistribution of K^+ from the extracellular fluid (ECF) to the intracellular fluid (ICF) space presumably into muscle.[4] Recovery from paralysis correlates with a return of serum K^+ to the normal range. Transient elevation of serum K^+ levels can be observed, especially with K^+ replacement as in this report. Thyrotoxic patients without a history of periodic paralysis do not develop muscle paralysis after attempts to induce attacks as described above.

Electrocardiographic changes of hypokalemia often are observed. Serious atrial or ventricular arrhythmias have been reported.[5] Serum PO4 levels have been variably depressed during the muscle paralysis.

TPP is sporadic, and a family history for the illness often is missing. However, an underlying genetic basis for the disorder is suggested by family studies from two reports. Affected siblings in one family shared identical leukocyte haplotypes.[6,7]

The etiology of the thyrotoxicosis in TPP most often is due to Graves' disease. Other causes described are multinodular goiter,[8] lymphocytic thyroiditis,[9] and exogenous thyroid hormone.[10] Symptoms of thyrotoxicosis usually are recorded preceding or occurring simultaneously with attacks of muscle weakness. There have been some reports of patients whose attacks of periodic paralysis preceded symptoms of thyrotoxicosis.[2] It is possible that the symptoms of thyroid overactivity in these patients were subtle and not recognized. It is difficult to judge whether there is a correlation between the severity of thyrotoxicosis and muscle paralysis.

Definitive therapy of TPP is linked to the control of thyrotoxicosis by either radioactive I-131, antithyroid drugs, or thyroid surgery. Patients are advised to curtail vigorous exercise and the consumption of large carbohydrate meals that may precipitate a paralytic attack while still thyrotoxic.

KCl and spironolactone have been used as prophylactic agents with limited success. Reserpine, an antiadrenergic agent that depletes neuronal norepinephrine, is not effective in curtailing a muscle attack. Propranolol, on the other hand, a nonselective Beta antagonist, has protected the majority of TPP patients from experiencing spontaneous or induced paralytic attacks.[11] While patients are taking propranolol, a large carbohydrate meal can still induce a fall in serum potassium, but the patient remains protected from muscle paralysis. With euthyroidism, patients with TPP are no longer at risk to develop spontaneous or induced attacks of paralysis.

For the management of acute muscle paralysis, oral liquid KCl is preferred. Intravenous solutions of KCl with glucose and/or saline have been noted to be associated with a delay in the correction of serum K^+.

Table 2 lists the differential diagnosis to be considered in a patient presenting with hypokalemia and flaccid muscle paralysis.[12] Symptoms and signs of thyrotoxicosis can be subtle or easily overlooked, and studies of thyroid status should be given careful consideration in the evaluation of a patient with hypokalemia and paralysis.

The clinical presentation of periodic paralysis as described for TPP is similar to what is observed for the hypokalemic form of primary periodic paralysis (HPP). Primary periodic paralysis (initially described in 1853) has an extensive medical literature.[13] The disorder has been separated into hypokalemic (HPP), normokalemic, and hyperkalemic forms based on the predominant aberration of serum K^+ noted during a muscle paralysis. HPP differs from TPP in that HPP

is a familial autosomal dominant disorder with low penetrance in females occurring in Caucasians and having its onset by adolescence. Muscle paralysis of HPP is not affected by excess thyroid hormone. A comparison between TPP and HPP is shown in Table 3.

Patients with TPP and HPP are suspected to share a similar underlying electrophysiological abnormality of the skeletal muscle membrane. Caution is needed when generalizing about rare disorders from a few studies, but it seems that insulin plays a pivotal role in the pathogenesis of the muscle paralysis in both TPP and HPP. In 1957, Zieler and Andreas demonstrated that in HPP patients, hypokalemia was associated with movement of K^+ ion from plasma into skeletal muscle during spontaneous attacks of muscle paralysis or during those induced by glucose and insulin.[14] These investigators demonstrated insulin's effect on K^+ was independent of its effect on glucose utilization.[15]

Insulin had significantly higher affinity for skeletal muscle membranes from a patient with HPP than from normal controls.[16] Increased binding would explain increased sensitivity of K^+ uptake into muscle from HPP patients.[17] Insulin increases skeletal muscle membrane permeability to Na^+ in part by an effect on sodium-hydrogen (Na^+-H^+) exchange,[18] which alters resting membrane potential. A partial depolarization of the resting muscle membrane potential between attacks of paralysis has been noted in HPP and is believed to reflect an increased membrane permeability to Na^+ ions.[19] Insulin stimulates the electrogenic Na pump,[20] which leads to hyperpolarization of the muscle membrane. The Na pump is a transmembrane ATPase that extrudes 3 intracellular Na^+ ions from the cell in exchange for $2K^+$ ions. Pump activity is depressed by low K^+ ions exterior to the cell.[21]

Clinically, patients with TPP are vulnerable to acute muscle paralysis as a result of the inciting factors that are listed in Table 3. Markedly elevated insulin levels (300-650 uU/ml) have been observed during muscle paralysis in some TPP patients.[22,23] It is speculated that an increased surge of insulin following large carbohydrate containing meals is reflected by increased levels of the hormone acting locally at the muscle membrane.

Thyrotoxicosis affects skeletal muscle membrane in TPP in a number of ways. The Beta 2 adrenergic receptor is hyperresponsive in thyrotoxicosis and enhances hyperinsulinism after a glucose meal.[24] Beta 2 receptors modulate K^+ movement into cells as does insulin by extrarenal mechanisms that involve increased activity of the Na pump.[12] Thyroid hormone also increases the activity of the Na pump.[25] It is tempting to speculate that in TPP patients, thyroid hormones work in concert with increased insulin and Beta 2 adrenergic activity to alter resting muscle membrane potentials that lead to muscle paralysis and/or hypokalemia (Figure 2).[26] ECF K^+ is lowered by the combined hormonal stimulation of the Na pump. In turn, the Na pump is depressed by low ECF

Table 3. Clinical Features of TPP and HPP

	TPP	HPP
Genetics	Sporadic ? HLA influence	Familial autosomal dominant
Predominant ethnic background	Oriental	Caucasian
Sex predominance (M:F ratio)	5-10:1	3:1
Age at onset (peak yrs)	30-60	< 20
Flaccid paralysis	yes	yes
Redistribution of K+ between ECF and ICF	yes	yes

Serum K+ after recovery	N or ↑	N or ↑
Frequency of attacks (greatest during)	Summer	Winter
Muscle histology	Normal or minimal vacuolar myopathy	Vacuolor myopathy
Treatment:		
Acute	Oral KCl	Oral KCl
Long term	Restore euthyroidism Propranolol	Oral KCl, Acetazolamide, Spironolactone, low NaCl and carbohydrate diet
Prognosis:	Good	Good: ↓ Attack frequency with ↑ age. Some patients have residual muscle weakness/atrophy.

? = conflicting data ↑ = increased ↓ = decreased N = normal range

K^+ resulting in depolarization and an inexcitable muscle.[27]

A defect in the role of calcium in the excitation-contraction cycle of muscle also has been observed in TPP.[28] Decreased calcium transport into the sarcoplasmic reticulum (SR) during muscle paralysis has been found in a patient with TPP using *in vitro* muscle studies. Calcium-ATPase levels were depressed during paralysis but not after recovery. Muscle Ca-ATPase levels are normal in patients with thyrotoxicosis without a history of periodic paralysis. The relationship between altered calcium uptake into skeletal muscle SR and paralysis to abnormalities in excitation of muscle membrane has not been clarified.

Our patient is a typical example of TPP with hypokalemia. A precipitating factor was large carbohydrate meals, although we could not provoke an attack of paralysis or hypokalemia with 100 gm oral glucose. Muscle strength returned to normal with potassium therapy. Correction of the thyrotoxicosis has resulted in no further attacks of periodic paralysis.

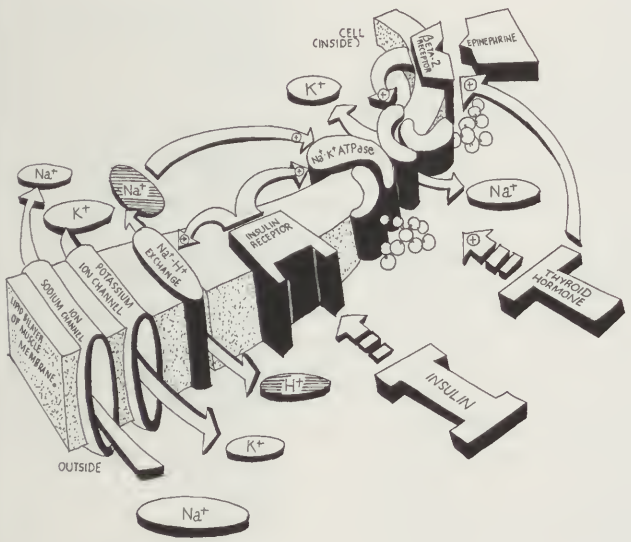

Figure 2. Interaction of thyroid hormone, insulin, and Beta - 2 adrenergic receptors and their effect on ion movements in skeletal muscle membrane

PIE's quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. PIE Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

QRP FACTS:

Strict Underwriting Criteria – Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

Scheduled Premium Reductions – Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

High Limits – Backed by our reinsurer, Lloyd's of London, PIE is able to offer higher coverage limits for qualifying doctors: up to $7 million for individual doctors and $13 million for group policies. Lloyd's of London is the largest reinsurer in the world.

Designed With Input from Doctors – PIE's QRP plan is an innovative modified claims-made insurance specially designed with input from PIE-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your PIE representative, or our headquarters office today.

Case Report: Phenytoin Hypersensitivity

Eugene Finan MD, Andrew Trofa MD, and Kenneth Williams MD

From the Department of Internal Medicine St. Agnes Hospital Baltimore.

Phenytoin hypersensitivity is a potentially fatal reaction to the chemical diphenylhydantoin. It is important to inform patients of possible complications and early sentinel signs of adverse drug reactions.

Phenytoin hypersensitivity is a potentially fatal reaction to the chemical diphenylhydantoin (Dilantin, Dihycon, Dilabid, DiLan). While the mechanism of which is unknown, it is presumed to be due to both cell-mediated immunity to phenytoin and to humoral immunity with production of specific antibody to the drug.[1-3] Previous studies of phenytoin hypersensitivity reactions have revealed a multitude of severe, multiorgan manifestations involving the skin, liver, kidney, muscle, lymphoid tissue, and blood.[4] Most cases (74 percent to 94 percent) develop a rash of some sort, typically of a lichenlike or morbilliform variety, sometimes manifested as the Steven-Johnson syndrome.[4,5]

Case Report

A 36-year-old man developed a rash approximately one week prior to admission. His general health had been excellent until ten weeks before admission when he developed a syncopal episode. The patient, employed as a roofer, had never before had syncope. The syncopal workup was extremely exhaustive, and a determination of a seizure disorder was made based on electroencephalogram (EEG). He was begun on phenytoin (Dilantin) at a dose of 400 mg daily. About six weeks after initiation of therapy, the patient developed a rash which began on his hands, wrists, and ankles and spread to the arms, legs, and eventually involved the neck, face, and trunk. The rash continued to spread for four to five days. The patient contacted his private physician who changed the anticonvulsive medication from phenytoin to carbamezipine. The skin eruption worsened, and within 48 hours a fever developed up to 105° F with rigors and sweats. At this time, the patient was referred for admission.

The patient had no history of allergies to medications. He had no other episodes of skin eruptions, no evidence of atopy, asthma, or other allergies. He had a childhood history of rubeola but no other viral exanthems. He had no exposures to tick-infested areas or travel outside the Baltimore area, and there was no history of IV drug use, homosexual activity, or transfusions. He had a history of a Bil-Roth II procedure for peptic ulcer disease and a history of congenital heart murmur. The pertinent family history included

two siblings with a history of epilepsy, but no history of allergies. He had been treated for gonorrhea but had no history of syphilis.

On examination, he had an appearance of a young man in significant distress with both high fever and generalized pruritus. Temperature was 104 ° F oral, heart rate 84 beats/min, respirations 22/min, and blood pressure 128/70 mm Hg. He was anicteric with no jugular venous distention. The neck was supple; thyroid gland was not enlarged. There was no sinus tenderness. There were a few small lymph nodes palpable in the cervical chains, but there was no other lymphadenopathy.

Funduscopic examination showed a slight arterial narrowing but without any other changes.

The skin examination revealed an erythematous and edematous rash involving the face with a vesicular appearance on the neck and ear with yellow drying crust. Erythematous papules and vesicles were seen in the upper extremities. There was marked erythema and edema with a maculopapular eruption on the chest and legs. There were no changes in the nail beds, nor was there involvement of the soles or palms.

Muscle tenderness was noted in the chest, arms, and legs. There was mild joint tenderness on passive motion of the hip and knee joints bilaterally. The range of motion was not affected. There was no weakness in any muscle group at this time.

The heart examination showed a regular rhythm with a grade 3/6 crescendo-decrescendo murmur heard throughout the precordium. There was also a 1/6 diastolic murmur heard at the lower left sternal border without radiation.

The abdominal examination revealed an old incision at midline and a small scar in the left subcostal region. There were normal bowel sounds throughout. The liver and spleen were not enlarged.

Neurologic examination was completely intact in all spheres. Admission chest x-ray was within normal limits. Electrocardiogram (EKG) showed a sinus rhythm with a PR interval of .21s. There was left anterior hemiblock with anterior, septal, and lateral schemia.

The WBC count was 10,400 with 40% segmented, 20% bands, 10% atypical lymphocytes, and 9% eosinophils, hemoglobin 14.6 gm/dl, hematocrit 43.3%, 314,000 platlets, sodium 136 mEq/L, potassium 4.5 mEq/L, chloride 100 mEq/L, bicarbonate 22 mEq/L, BUN 14 mg/dl, creatinine 1.2 mg/dl, and glucose 107 mg/dl.

The urinalysis showed 3+ proteinuria with a pH of 6.0, occasional white cells and red cells but no blood, and there was bile present. The LDH was 1,041 U, SGOT 46 U, SGPT 56 U, CPK 103 U, alkaline phosphatase 159 U, GGT 132 U, albumin 3.9 g/dl, sedimentation rate 37 mm/hr.

Hospital Course

The initial impression was that of phenytoin hypersensitivity reaction. The patient was febrile and continued with temperature elevations to 104 ° F and remained so for four days. He was given aspirin 650 mg every four hours along with oxycodone for pain relief. An echocardiogram was performed to evaluate the heart murmur, and it revealed a thickened aortic valve. He was started empirically on IV nafcillin because of possible endocarditis. A total volume of 80cc of blood was obtained for culture; there was no growth after two weeks. In view of the constellation of symptoms, the temporal association with the use of phenytoin, and the negative evaluation for infection, the fever was attributed solely to phenytoin toxicity. Nafcillin was stopped.

Analysis of the patient's serum revealed a marked elevation of his CPKs with a day one level of 2,024 units peaking on the day five with 9,971. MB fraction was obtained and was found to be .5 percent of the total. LDH also increased and rose to 3,181 units on day five. Aldolase level was obtained to confirm muscle inflammation and a level of 21.0 units/L was obtained (normal value 1.2 to 7.6). The development of myositis was accompanied by severe muscle pain and weakness. The patient was unable to raise his legs off the bed on the fifth hospital day. On the seventh hospital day, treatment with intravenous hydrocortisone sodium succinate 100 mg IV followed by prednisone at 40 mg po bid was begun. The patient's myositis rapidly improved with CPK levels dropping to 544 u after four days of steroids. No muscle pain was left after the fifth day of steroids, and the patient gradually recovered muscle strength.

The most dramatic aspect of this patient's case was the sudden development on day five of acute renal failure. The urine had been tested daily for myoglobin and repeatedly was found to be negative. On the fifth day of hospitalization, the patient was found to have a 20 lb weight gain. The sodium level abruptly dropped to 113 mEq/L, BUN increased to 47 mg/dl, creatinine increased to 54. mEq/dl, potassium increased to 5.4 meq/L, and bicarbonate dropped to 18 meEq/L.

Aggressive repletion of the sodium in this patient was crucial due to the history of seizure activity. Both sodium bicarbonate tablets and sodium chloride tablets were given to replete the total body sodium in this patient. Emergency hemodialysis was necessary on day seven due to persistent hyperkalemia (a level of 7.7 mEq/L was found) along with acute ST interval prolongation up to .48s. Sodium polystyrene was given prior to hemodialysis. Only one hemodialysis was necessary because by day nine, the renal function began to return subsequent to steroid treatment. The creatinine decreased to normal by discharge.

Because of the history of heart murmur, the patient had undergone an echocardiogram seven weeks prior to admission revealing a normal appearance of the aortic valves although there was aortic regurgitation. The echocardiogram, as previously stated, was repeated on admission to rule out the possibility of endocarditis as the source of fever. The echocar-

diogram on admission revealed the suggestive findings of a vegetation. Based on this, a total of 80cc of blood was cultured and revealed no evidence of bacteremia. Two weeks after the patient's admission, a third echocardiogram was performed and did indeed reveal shrinkage of the thickening on the aortic valve, in apparent response to the systemic corticosteriods.

The patient was discharged on the seventeenth hospital day in good condition with a diagnosis of phenytoin hypersensitivity reaction. His myositis had resolved with the recovery of his motor strength through physical therapy to the point of walking with a cane. The renal failure, hepatitis, and dermatitis all had resolved with high dose corticosteroids. He was discharged on prednisone 40mg/day and carbamazepine 200 mg/3X/day.

Discussion

This case illustrates the possible severity and complexity of the potential effects of hypersensitivity reactions. Phenytoin is often used to treat seizure disorders, and its frequency of use has allowed thorough examination of its complications. A previous report by Michael and Mitch[5] served as a useful adjunct in the successful treatment of this particular patient. He exhibited many of the same manifestations of phenytoin hypersensitivity plus the addition of an apparent endocarditis due to acute endocarditic valvular inflammation secondary to the hypersensitivity reaction. The echocardiographic image of a normal-appearing valve just seven weeks prior to admission for drug reaction served as a strong indicator that the valvular "vegetation" and thickening found during the patient's admission was likely due to the proximate, severe hypersensitivity reaction.

The twelve blood cultures that were negative for fourteen days and his improvement with corticosteroid treatment are convincing. This endocarditic syndrome is consistent with a nonbacterial thrombotic endocarditic episode. There also is description in the literature of a syndrome called Libman-Sacks endocarditis (which occurs primarily in systemic lupus erythematosus) and also of the syndrome seen in scleroderma where endocarditis is thought to be induced due to immune system involvement of the endocardium, just as we believe this hypersensitivity reaction caused in this patient.[6] We expect that a follow up echocardiogram performed on this patient will reveal complete resolution of the echocardiographic findings.

We believe the severity of this patient's drug reaction serves as a reminder of potential complications induced by medical intervention. It is important to discuss with the patient the potential complications involved in treatments and the sentinal signs of potential trouble.

Case Report: Ataxic Hemiparesis - Localization by MRI

Morton D. Kramer MD and Dean S. Tippett MD

Dr. Kramer is Chief of the Department of Neurology, St. Agnes Hospital, Baltimore, and Dr. Tippett is a member of the Department of Neurology, University of Maryland School of Medicine and Medical System, Baltimore.

Ataxic hemiparesis is a recognized lacunar syndrome that has been demonstrated previously by neuropathologic examination and computed tomography. In a subgroup of ataxic hemiparesis, pontine lesions have been localized by magnetic resonance imaging.

In 1965, Fisher and Cole first described a syndrome of moderate hemiparesis and ipsilateral "severe cerebellar-like ataxia" occurring in fourteen patients.[1] Neuropathological examination was performed in only one case and was obscured by multiple lesions. Based on this examination, the causative lesion was placed in the upper part of the posterior limb of the internal capsule, although other sites, including the pons, were considered. In 1978, Fisher designated the syndrome "ataxic hemiparesis" and presented three cases that showed contralateral upper basis pontis lesions by pathologic examination.[2] Since then lesions involving the pons, midbrain, posterior limb of the internal capsule, and the corona radiata have been identified both pathologically and by computed tomography (CT) as producing this syndrome.[3-14]

The pontine lesion results from occlusion of one of the paramedian branches of the basilar artery. These arteries supply the medial pontine region comprised of pontine nuclei, corticospinal, corticopontine, and corticobulbar fibers. Ataxia is believed to result from injury to the pontine nuclei.[15] In 1987, Nabatame and his colleagues first utilized magnetic resonance imaging (MRI) to localize lesions in pontine ataxic hemiparesis and described isointensity bands in the pons suggesting differential susceptibility to ischemia.[16] The posterior limb of the internal capsule is supplied by the anterior choroidal artery and striate arteries, arising from the anterior circulation.[15] Ataxia from a lesion here is explained by the abundance of corticopontine fibers grouped in the posterior limb of the internal capsule.[17] The midbrain and corona radiata lesions also are thought to disrupt descending corticopontine fibers.[4,10]

Therefore, the syndrome of ataxic hemiparesis can result from lesions in the anterior circulation (branches from the middle cerebral artery) or the posterior circulation (paramedian branch of the basilar artery).

In many cases, an anatomic localization is not made despite neurodiagnostic studies. CT is positive in the evaluation of lacunar

strokes in only 34.7 percent of the cases.[18] Attempts to place lesions by associated findings (that is, nystagmus associated with a pontine lesion and sensory deficit associated with an internal capsule lesion) are unreliable.[11,14]

Clinical findings of ataxic hemiparesis often have been considered a single syndrome. Recently, the natural history of lacunar infarction, including ataxic hemiparesis, was reported. However, a distinction was not made by anatomic location.[18] The natural history of pontine ataxic hemiparesis versus internal capsule ataxic hemiparesis has never been compared primarily because of the inability to localize the lesion consistently.

Case Report

A 50-year-old right-handed normotensive physician had a sudden onset of left sided weakness and difficulty walking while he was making hospital rounds. He noted difficulty controlling his left leg, and a feeling of numbness, "tightness," and mild weakness in this extremity. Approximately two hours later, he noted similar symptoms to a lesser degree involving his left arm. The following morning, his symptoms had not changed and he sought neurologic consultation.

Physical examination revealed blood pressure of 140/100 mm Hg; 80/min; regular, normal respiratory rate; and normal temperature. Blood pressure in five minutes was 140/90 mm Hg. General physical examination was unremarkable. Carotids were full and without bruits. Lungs were clear, and cardiac exam revealed regular rate and rhythm without murmur. The patient was alert. Cognitive function and speech/language were normal. Cranial nerves were normal. No nystagmus was present. Motor exam revealed slight downward pronator drift with a positive digitiquinti sign on the left. Quantitative motor exam did not show significant left side weakness. No sensory changes were noted to pin, light touch, vibration, or proprioception. He had mild left-sided dysmetria on finger-to-nose and heel-to-shin testing. Deep tendon reflexes were slightly increased in the left upper and lower extremities. Although the Babinski sign was not present, the left great toe did not plantar flex as strongly as the right. Gait was unsteady, and he favored his left leg.

Routine chemistry, hematology, and serology studies were normal. Electrocardiogram and chest radiograph were normal. Head CT on admission with and without contrast failed to show a lesion (Figure 1). An electroencephalogram (EEG) showed no focal damage. MRI scan of the brain was obtained on the third hospital day and revealed a focus of high signal intensity measuring approximately 7 mm in the anteroposterior extent involving the posterior limb of the right internal capsule (Figure 2). The lesion was

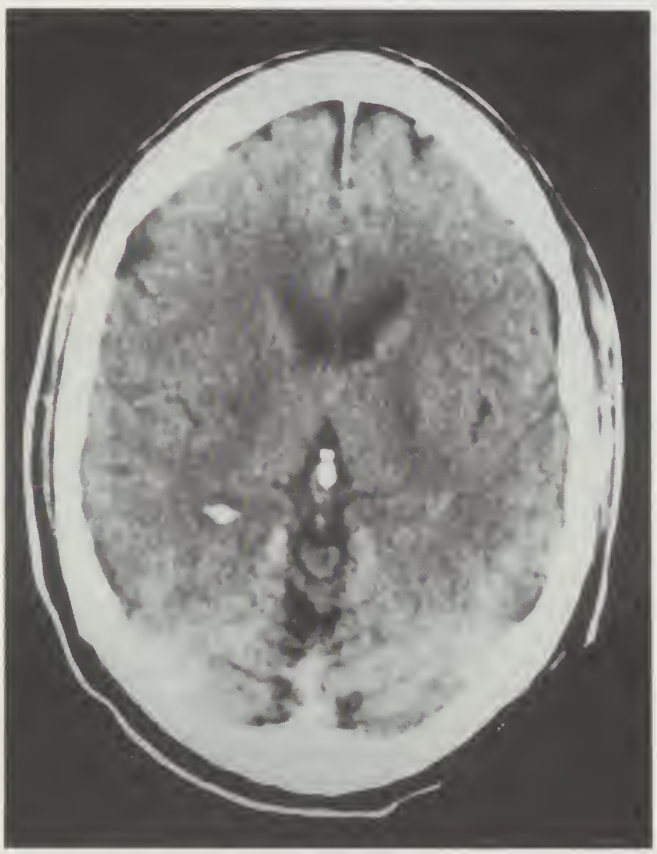

Figure 1. Computed tomography scan (day of admission): normal scan

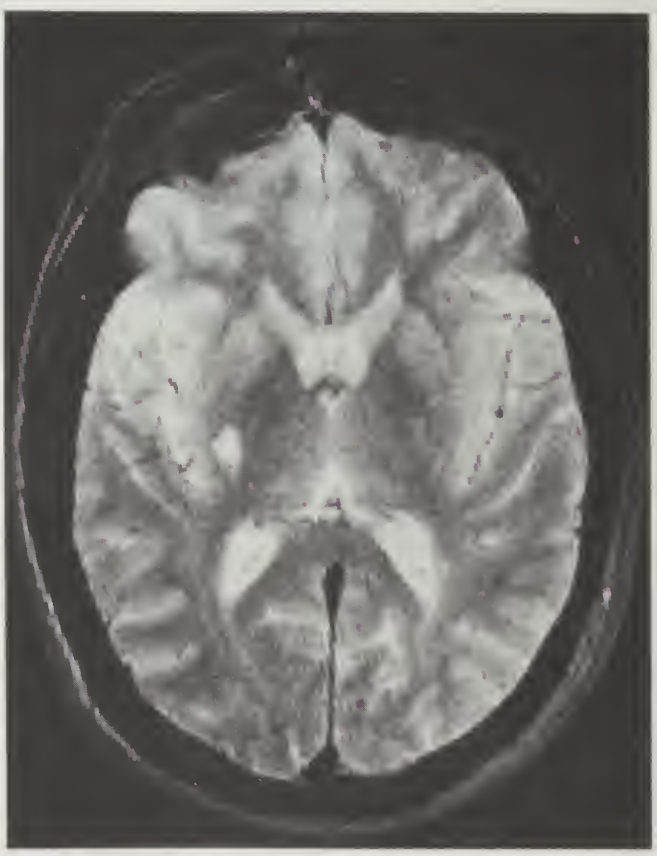

Figure 2. Magnetic resonance image (third hospital day): 7 mm nonhemorrhagic infarct involving the posterior limb of the right internal capsule

consistent with a nonhemorrhagic infarct. A 24-hour Holter monitor recording was normal. A carotid duplex study showed a questionable soft plaque on the posterior wall of the right internal carotid artery, but there was no evidence of an ulcerating lesion. Carotid arteriogram was normal.

Five days after admission, there was no focal weakness and minimal ataxia in both the left upper and lower extremities. Deep tendon reflexes remained slightly increased on the left side, but there were no pathologic reflexes. The patient returned to work part-time one week after admission and within two weeks resumed full-time activity. Two weeks after the onset of symptoms he reported total resolution of the left arm weakness but continued to complain of feeling "not confident" about his left leg, while walking and numbness in his left arm and leg that could not be demonstrated by testing. On reexamination there was no pronator drift and no demonstrable weakness. There was slight persistent ataxia on left heel to shin testing. Left deep tendon reflexes were still increased. There was sustained left ankle clonus, and he continued to favor his left leg when he walked.

Figure 3. Computed tomography scan (16 days after onset of symptoms): normal scan

A repeat head CT scan without contrast was performed sixteen days following the onset of symptoms and was again within normal limits (Figure 3).

Conclusion

In this patient with the lacunar syndrome of ataxic hemiparesis, both the initial and a sixteen-day followup CT scan were normal. MRI scan on the third hospital day revealed the site of the lesion as well as dimension and type. The value of MRI has been reported in pontine ataxic hemiparesis.[16] In this case, its usefulness is demonstrated in the localization of the other major lesion site of the ataxic hemiparesis lacunar syndrome, the posterior limb of the internal capsule.

If You Are Looking For A High Quality Clinical Laboratory With A Strong Commitment To Personalized Service, Then Call . . .

SmithKline Beecham Clinical Laboratories

The One Lab For Your Clinical Testing Needs

Accurate Results

At SBCL, accurate results are no mistake. By constant checking and recalibration of equipment, blind submission of control samples, regular participation in federal, state and independent proficiency programs, and a multi-tiered quality control system that evaluates every phase of testing, we ensure you get accurate results – each and every test. And, our professional staff is available for consultation.

Service

From the top down, the people of SBCL take pride in meeting your individual needs.Whether it is the courtesy and knowledge of a client service representative, or the cooperation of your sales manager or help from a field service representative, you'll discover your needs are important to us. We also offer direct billing to insurance providers and continuing education programs.

Test Availability

SBCL offers over 1400 tests from the routine to the rare. With a trained staff and sophisticated instrumentation, we are able to respond rapidly to all your testing needs at our new facility located in Owings Mills, MD.

Hospital Donation of Eye Tissue: The Physician's Vital Role

Richard M. Susel MD, FACS

Dr. Susel is Chief of Ophthalmology, St. Agnes Hospital, Baltimore. From 1983 to 1987 he was the Medical Director and Chairman of the Medical Advisory Board of the Medical Eye Bank of Maryland.

Whoever deals directly with the next of kin in soliciting tissue donations, the physician's identification of potential donor families is at the heart of a successful hospital tissue recovery program.

Corneal transplantation is the most frequently performed human transplant procedure in the United States. Under certain conditions, this surgery is more than 90 percent successful in restoring sight to patients who are blind or suffer severe loss of vision due to injury, infection, inherited or congenital conditions, corneal diseases, chemical burns, and other kinds of corneal trauma. In the last 28 years, more than 300,000 corneal transplants have been performed on men, women, and children ranging in age from 9 days to 103 years.[1]

The Medical Eye Bank of Maryland is the single largest source of surgical quality corneas in the state. Last year alone the Eye Bank recovered, processed, and distributed tissue for more than 2,000 corneal transplants. Founded in 1962 with a grant from the American Legion, the Eye Bank is a nonprofit agency that depends upon public donation for sufficient eye tissue to distribute to area surgeons. In addition to providing corneas for transplant surgery, the Eye Bank also supplies eye tissue to physicians and researchers engaged in a variety of projects investigating the causes and potential cures of all types of human blindness.

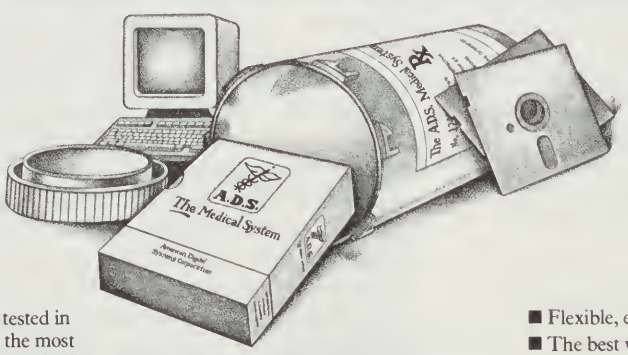
Tissue is secured in two basic ways. Maryland is one of 12 states with a Medical Examiner's Law that permits the recovery of tissue with the presumed consent of the decedents next of kin. The other important source of tissue is hospitals.

In the hospital situation, tissue recovery depends on the cooperation of a number of disciplines including physicians, nurses, and administrative and support personnel. Maryland, like other states, operates under federal Required Request legislation that mandates all hospitals to offer next of kin the opportunity to donate tissue and organs. Although all hospitals must comply with the Required Request laws, the protocol used varies with individual hospitals. In fact, the Medical Eye Bank of Maryland can design a program that meets each institution's unique needs so there is virtually no disruption of hospital routine.

St. Agnes Hospital has a long history of commitment to recovering donor eyes. Active since the Eye Bank's inception in 1962, St. Agnes has provided the Eye Bank with 868 eyes from 434 donors

since 1983 alone. In this time the hospital has reaped benefits from the program that accrue to physicians, nursing staff, and donor families as well as to eye tissue recipients.

Eye tissue should be removed as soon as possible after death, and at St. Agnes the admission department phones the Eye Bank at *every* death, maximizing opportunities for tissue recovery. Anyone can be an eye donor regardless of age, race, quality of vision, medical history, or cause of death. At St. Agnes, it is the medical residents who approach next of kin to request donor tissue. The Eye Bank conducts on-going inservice programs to assist medical residents in refining their approach to donor families and increasing their comfort level in this sensitive situation. The most successful are committed to the intrinsic value of tissue recovery and transplantation and view approaching next of kin as an extension of patient and family care and support during a most difficult time. They recognize the solace that tissue donation may give surviving family members. Altruism has been established as a major reason for donation, but a recent study also indicated that a strong motivating factor relates to mitigating the death of the family member.[2] Making sense of what is sometimes senseless death is consolation for many survivors, as is the belief that tissue donation is a legacy that represents the deceased positively after death. Similarly, the act of presenting the opportunity to donate also helps the medical staff deal with patient loss.



It is true that some physicians are more comfortable than others in approaching potential donor families. All physicians, however, can play the most vital role in tissue recovery by identifying potential donors to the Eye Bank. Where physicians, for a variety of reasons, are reluctant to approach donor families, the Eye Bank uses its own well-trained personnel to make the approach by phone or in person. Nurses are also excellent advocates of tissue recovery programs and, in many cases, secure permission for donation.

Finally, the physician by his/her position of influence within the hospital community can establish an atmosphere conductive to tissue recovery. The physician who appreciates the value of tissue donation, the way in which corneal transplant surgery can transform lives and can change darkness to light, will encourage tissue recovery within the hospital and strong cooperative programs with the Eye Bank.

For daily office headaches, take what doctors recommend.

The A.D.S. Medical System. It's been tested in medical offices for years and found to be the most effective and affordable remedy for all kinds of office headaches.

You know the headaches.

Mountains of paperwork. Appointment scheduling. Insurance forms and claim submissions. Files and files of patient information. Billing and receivables. Payroll. And more.

Now try the most effective and affordable cure.

The A.D.S. Medical System is a proven high performance, easy-to-use system that offers the features you need to fully automate your practice.

- Shortest training period of any system
- Top quality hardware/software service support
- Flexible, expandable multi-user reliability
- The best value available

Call for more information or a free demonstration.

Once you've examined our system, you'll find it's the best available cure for the headaches of managing and operating your practice.

The A.D.S. Medical System. It can make a practice perfect.

In the Matter of
Jerome H. Begun MD
Before the
Maryland Board of
Physician Quality Assurance

Applicant for Licensure

Findings of Fact
Conclusions of Law, and Order

Jerome H. Begun (Applicant) applied for a license to practice medicine in Maryland by application dated July 21, 1988. After investigating Applicant's fitness to practice medicine in Maryland and determining whether Applicant met the qualifications to be licensed in Maryland, the Maryland Board of Physician Quality Assurance (the Board) voted to initially deny Applicant's application. By charging documents dated June 26, 1989, the Board issued its Notice of Intent to Deny Application for Licensure. Specifically, the Board charged that Applicant could be denied a license in Maryland because Applicant lacked good moral character, one of the prerequisites to licensure in Md. Health Occ. Code Ann. (H.O.) §14-305(b)[1] (1988 Cum. Supp.). Additionally the Board charged pursuant to H.O. §14-205(a)(1)(iii) that Applicant was disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state ... for an act that would be grounds for disciplinary action under this section. H.O. §14-504(a)(21).[2] The grounds under §14-504 which the Board charged were applicable were

> Fraudulently or deceptively obtains or attempts to obtain a license for the applicant. H.O. §14-504()(1).[3]
> Is guilty of .... unprofessional conduct in the practice of medicine. H.O. §14-504(a)(3).[4]
> ... (I)s convicted of or pleads guilty or nolo contendere with respect to a crime involving moral turpitude. H.O. §14-504(b).[5]

A hearing was held before a hearing officer on November 1, 1989. Present at the hearing were: Debra G. Woodruff, Assistant Attorney General, Administrative Prosecutor. Although John Wheeler Glenn, Esquire, had previously entered his appearance in the case, he was not present. Mr. Glenn was contacted by telephone and related that his office had made numerous attempts both by telephone and by mail to contact the Respondent, all of them unsuccessful. Mr. Glenn entered his appearance at the hearing by telephone for the limited purpose of reading into the record his attempts to contact his client. Mr. Glenn subsequently wrote a letter to the Hearing Officer requesting that his appearance be stricken in view of the complete failure of cooperation of his client. The case was heard after the Hearing Officer determined that the Respondent was given proper notice of the date of the hearing and had been notified that the hearing could be held *ex parte* pursuant to H.O. §14-505.

At the hearing the State introduced the following documentary evidence. No witnesses testified for the State.

Summary of Evidence

State Exhibit 1: California Indictment and related Papers, Criminal Number CR 70-44, United States District Court for the Northern District of California, consisting of thirty-six (36) pages.
State Exhibit 2: California Medical Board Decision Number D-1297 consisting of seven (7) pages.
State Exhibit 3: Medical Licensing Board of Indiana Decision, dated January 23, 1980 consisting of eight (8) pages.
State Exhibit 4: State of Ohio Medical Board Final Order, dated May 21, 1980 and related papers consisting of thirteen (13) pages.
State Exhibit 5: United States District Court for the Eastern District of California, Criminal Docket Number Cr. S-80-162, consisting of twenty (20) pages.
State Exhibit 6: State of California Medical Quality Board Decision Not To Reinstate Petitioner's Revoked Certificate, Number OAH N-30840, consisting of ten (10) pages.
State Exhibit 7: Applicant's Application to the State of Maryland dated, July 21, 1988 and related papers, consisting of forty-three (43) pages.
State Exhibit 8: Board of Physician Quality Assurance (the Board) Notice of Intent to Deny Application for Licensure, dated June 26, 1989 with related papers, consisting of eight (8) pages.
State Exhibit 9: Return Receipt indicating delivery of Notice of Intent to Deny as June 28, 1989, consisting of two (2) pages.
State Exhibit 10: Applicant's Letter of Delay, dated July 24, 1989, with address of P.O. Box 355, Cambridge, Ohio 43725, consisting of one (1) page.
State Exhibit 11: Entry of Appearance of John Wheeler Glenn, Esquire, dated August 10, 1989 consisting of one (1) page, and agreeing to the date of November 1, 1989 for a hearing.

By letter dated November 28, 1989, the Hearing Officer forwarded to the Applicant and the State the

1. The requirement of being of "good moral character" has been a continuing requirement of licensure. *See* Article 43 §124 Annotated Code of Maryland 1964; Article 43, §123(b) Annotated Code of Maryland 1980. Repealed by Acts 1981, chapter 8 § 8, effective July 1, 1981 without substantive change to §14-305(b), Health Occupations Article Annotated Code of Maryland 1981.

2. The chapter laws of 1981 enacted §14-205(a)(2) "Subject to the Administrative Procedure Act deny a license to an applicant for any of the reasons that are grounds for disciplinary action under §14-504 of this title." The revisor's note states that the "new language [is] added to state expressly a power that formerly was only implied - that the Board may deny a license on the grounds listed in §14-504 of this title." Health Occupations §14-205 Revisor's Note, Annotated Code of Maryland 1981. H.O. §14-504(a)(21) had formerly been Article 43, §130(h)(19) and became H.O. §504(22) by the 1981 amendments. *See* Maryland Annotated code 1980.

3. Prior to the Amendment of Health Occupations Article, Medical Practice Act in July of 1988 this section had been H.O. §14-504(6). The Chapter Laws of 1988 derived this language without substantive change from Article 43 §130(h) Annotated Code of Maryland 1980. *See* Article 43 §145, Annotated Code of Maryland 1957.

4. "Unprofessional conduct" was added by 1988 amendments.

5. Prior to the 1988 amendments this section was H.O. §14-504(6). This section had been derived without substantive change from Article 43, §130(h) Annotated Code 1980; *See* Article 43, §145, Annotated Code 1957.

Proposed Decision in this case which contained Proposed Findings of Fact, Proposed Conclusion of Law, and a Recommendation. The Hearing Officer notified the Applicant and the State of the right to file exceptions with the Board and stated any exceptions should be filed within twenty-one (21) days of receipt of the Proposed Decision.[6] By letter dated February 20, 1990, the Board notified the Applicant and the State that it had received no exceptions. The parties were notified that the case would be scheduled for Board action on Wednesday, February 28, 1990.[7]

On Wednesday, February 28, 1990 the Board considered the Proposed Decision, and by both a preponderance of evidence and convincing evidence on the affirmative vote of a majority of the full authorized membership of the Board issued the following Final Decision and Order.

Findings of Fact

1. The United States District Court for the Northern District of California convicted Applicant of seven (7) narcotics counts involving illegal sales of drugs and five (5) counts of illegal possession of unregistered firearms and sentenced him to seven years of imprisonment on September 3, 1970. Specifically Applicant was found guilty of

a. 26 U.S.C. 4705 (a)—on or about November 11, 1969, knowingly and willfully unlawfully sell, barter, exchange and give away to a Federal Agent of the Bureau of Narcotics and Dangerous Drugs, a narcotic drug, to wit, approximately three hundred forty five (345) tablets containing morphine sulfate, not in pursuance of a written order from that Agent on a form issued in blank for that purpose by the Secretary of the Treasure or his delegate as required by the laws of the United States.

b. 26 U.S.C. 4705(a)—On or about November 24, 1969, knowingly and willfully unlawfully sell, barter, exchange and give away to a Federal Agent of the Bureau of Narcotics and Dangerous Drugs, a narcotic drug, to wit, approximately fifty (50) tablets containing morphine sulfate, not in pursuance of a written order from that Agent on a form issued in blank for that purpose by the Secretary of the Treasury or his delegate, as required by the laws of the United States.

c. 21 U.S.C. 331(q)(2)—On or about December 10, 1969, knowingly unlawfully sell, deliver, and dispose of a drug, to wit, approximately eight thousand (8,000) tablets containing dextro amphetamine sulfate, a depressant or stimulant drug within the meaning of 21 U.S.C. Section 321(v)(2) to a Federal Agent of the Bureau of Narcotics and Dangerous Drugs.

d. 26 U.S.C. 4705(a)—On or about January 6, 1970, knowingly and willfully unlawfully sell, barter, exchange and give away to a Federal Agent of the Bureau of Narcotics and Dangerous Drugs, a narcotic drug, to wit, two hundred (200) tablets containing Dolophine, not in pursuance of a written order from that Agent on a form issued in blank for that purpose by the Secretary of the Treasury or his delegate, as required by the laws of the United States.

e. 21 U.S.C. 331(q)(2)—On or about January 6, 1970, knowingly unlawfully sell, deliver, and dispose of a drug, to wit approximately ten thousand (10,000) tablets containing dextro amphetamine sulfate a depressant or stimulant drug within the meaning of 21 U.S.C. Section 321(v)(2) to a Federal Agent of the Bureau of Narcotics and Dangerous Drugs.

f. 26 U.S.C. 4705(a)—On or about January 7, 1970, knowingly and willfully unlawfully sell, barter, exchange and give away to a Federal Agent of the Bureau of Narcotics and Dangerous Drugs, a narcotic drug, to wit, approximately one thousand (1,000) tablets containing Dolophine, not in pursuance of a written order from that Agent on a form issued in blank for that purpose by the Secretary of the Treasury or his delegate, as required by the laws of the United States.

g. 26 U.S.C. 4705(a)—On or about January 7, 1970, knowingly and willfully unlawfully sell, barter, exchange and give away to a Federal Agent of the Bureau of Narcotics and Dangerous Drugs, a narcotic drug, to wit, approximately one thousand (1,000) tablets containing Dilaudid, not in pursuance of a written order from that Agent on a form issued in blank for that purpose by the Secretary of the Treasury or his delegate, as required by the laws of the United States.

h. 26 U.S.C. 5861(d)—On or about January 7, 1970, did unlawfully possess a firearm, within the meaning of 26 U.S.C., Section 5845, to wit: one Schmeisser MP 40 9 mm machine gun, serial number 4070, which was not then registered to the defendant in the National Firearms Registration and Transfer Record.

i. 26 U.S.C. 5861(d)—On or about January 7, 1970, did unlawfully possess a firearm, within the meaning of 26 U.S.C., Section 5845, to wit: one Luger, Model 1917, 9mm short barrel rifle, having a barrel length of 7 13/16 inches with wooden shoulder stock, serial number 2114, which was not then registered to the defendant in the National Firearms Registration and Transfer Record.

j. 26 U.S.C. 5861(d)—On or about January 7, 1970, did unlawfully possess a firearm, within the meaning of 26 U.S.C., Section 5845, to wit: one Mauer 9 mm short barrel rifle, with wooden shoulder stock, having a barrel length of 5 1/2 inches, serial number 24452, which was not then registered to the defendant in the National Firearms Registration and Transfer Record.

k. 26 U.S.C. 5861(d)—On or about January 7, 1970, did unlawfully possess a firearm, within the meaning of 26 U.S.C., Section 5845, to wit: one Radom Model 35, 9 mm short barrel rifle, with wooden shoulder stock, having a barrel length of 4 21/32 inches, serial number 9607, which was not then registered to the defendant in the National Firearms Registration and Transfer Record.

l. 26 U.S.C. 5861(d)—On or about January 7, 1970, did unlawfully possess a firearm, within the meaning of 26 U.S.C., Section 5845, to wit: one Browning Model 35, 9 mm short barrel rifle, with wooden shoulder stock, having a barrel length of 4 3/4 inches, serial number 62978 which was not then registered to the defendant in the National Firearms Registration and Transfer Record.

2. 26 U.S.C. 4705(a), 26 U.S.C. 5861(d), and 21 U.S.C. 331(q)(2) are crimes involving moral turpitude.

3. On December 24, 1971, the Board of Medical Examiners of California revoked the Applicant's license to practice medicine because of the felony convictions set forth herein.

4. On January 30, 1980, the Medical Licensing Board of Indiana revoked the Applicant's license to practice in that State because the Applicant had falsely stated in his application that he had never been convicted of violating the Federal Anti-Narcotics Act or other federal or state laws.

5. On May 21, 1980, the State Medical Board of Ohio revoked the Applicant's license to practice in that state because the license was obtained as a result of fraud in the application.

6. The Proposed Decision and transmittal letter were sent to the Applicant at the address he had used on his letter of July 24, 1989.

7. The Board's letter were sent to the Applicant at the address he had used on his letter of July 24, 1989.

6. On September 10, 1981, the United States District Court for the Eastern District of California convicted the Applicant of conspiracy to defraud the United States by obtaining payment of false, fictitious, and fraudulent claims in the Civilian Health and Medical Program of the Uniform Services (CHAMPUS), a felony. Applicant was sentenced to two (2) years imprisonment with all but six (6) months thereof suspended and five (5) years probation. Specifically Applicant was found guilty in violation of 18 U.S.C. 286, Conspiracy as charged in Count 12 of a twenty (20) count indictment. The remaining counts were dismissed.

7. 18 U.S.C. 286 is a crime involving moral turpitude.

8. On March 21, 1988, the Board of Medical Quality Assurance for the State of California found that the Applicant had failed to establish that he had rehabilitated himself to the extent that restoration of his license to practice medicine would be warranted, and Applicant's petition for reinstatement was denied. On April 20, 1988, the stay of the execution of the decision was granted until May 20, 1988.

9. The United States District Court for the Northern District of California and the United States District Court for the Eastern District of California are not courts of a state, i.e., they are not state courts but courts of the United States government.

10. The Board of Medical Examiners of California, the Board of Medical Quality Assurance for the State of California, the State Medical Board of Ohio, and the Medical Licensing Board of Indiana are licensing and disciplinary authorities of the respective states.

11. Applicant was given proper notification of all proceedings before the Hearing Officer and the Board.

Conclusions of Law

Based on the foregoing Findings of Fact, the Board concludes as a matter of law that Applicant

> Lacks good moral character as is required by H.O. §14-305(b) as a prerequisite for licensure; and
> Committed the prohibited act of being
> ... (D)isciplined by a licensing or disciplinary authority ... for an act that would be grounds for disciplinary action under this section. Specifically:
> Fraudulently or deceptively obtains or attempts to obtain a license for the applicant; H.O. §14-504(a)(1) and
> ... (I)s convicted of or pleads guilty or nolo contendere with respect to a crime involving moral turpitude. H.O. §14-504(b).[8]

8. In reaching this result the Board notes that its conclusions of law are based on the actions taken by Indiana, Ohio, and California insofar as there were no facts introduced by the State supporting a conclusion of law that Applicant had been convicted by a court of any state. Further although the Hearing Officer suggested that Applicant was guilty of "unprofessional conduct in the practice of medicine" this ground for discipline was not effective until July 1, 1988, which was some time after the last of the actions taken by any state or United States Court. There is no retroactive application of this section.

The finding that Applicant lacks good moral character is based on the overwhelming evidence introduced by the State relating to fraudulent conduct and criminal activity. Applicant bore the burden of demonstrating that he had good moral character. There was no evidence introduced by Applicant as to his present character.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 14th day of March 1990, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case,

ORDERED that Applicant's application for a license to practice medicine in the State of Maryland is DENIED; and be it further

ORDERED that this a final order.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Re: Surrender of License
Case No. 89-0298
License No. D26655

Dear Dr. Weiner and Members of the Board:

Please be advised that I have decided to surrender my license to practice medicine in Maryland. It is my understanding that I may apply for reinstatement of my license after I complete a training program approved by the Board, subject to the requirements set forth in Health Association Article, Section 14-315. Thus, my decision to surrender my license is REVOCABLE.

It is my understanding that this letter of surrender will be considered a public document on March 5, 1990.

On November 22, 1989, the Board charged me with a violation of Md. Health Occ. Code Ann. §14-504(a)(22) (1989 Cum. Supp.). Section 14-504(a) provides in pertinent part:

> Subject to the hearing provisions of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:
> (22) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality medical

and surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State.

A settlement conference was held on January 3, 1990. As a result of negotiations with representatives of the Board present at the settlement conference, I agreed to surrender my license. Consequently, the hearing scheduled for January 25, 1990, was postponed.

I have not practiced medicine in Maryland since October 26, 1988. On December 14, 1988, I resigned from the staff at Sacred Heart Hospital in Cumberland, MD.

I hereby affirm that I do not have any hospital privileges in Maryland.

I am licensed to practice medicine in Texas (license number D8160). I acknowledge that on March 5, 1990, the Board will send a copy of this letter of surrender to G.V. Brindley, Jr., MD, Executive Director, Texas State Board of Medical Examiners, P.O. Box 13562, Capital Station, Austin, TX 78711.

I have applied for a license to practice medicine in the State of Washington. I acknowledge that on March 5, 1990, the Board will send a copy of this letter of surrender to Patti L. Rathbun, Executive Officer of the Board of Medical Examiners, Professional Licensing Division, Washington Department of Licensing, 1300 South Quince, Olympia, WA 98504.

I agree to sign DEA Form 104, Voluntary Surrender of Controlled Substances Privileges. I acknowledge that the Board will send my DEA Registration Certificate, DEA Form 104 and a copy of this letter of surrender to Robert Bickel, Group Supervisor, DEA, 31 Hopkins Plaza, Room 955, Baltimore, MD 21201.

I hereby affirm that I do not have any DEA order forms for Schedule I or II drugs.

I acknowledge that the Board will send my Maryland CDS Registration Certificate and a copy of this letter of surrender to Charles Tregoe, Chief, Division of Drug Control, 4201 Patterson Avenue, Baltimore, MD 21215.

Before the Board accepts this letter of surrender as a resolution of case number 89-0298, I must present to the Board the following:

1. Maryland License D26655, Renewal Certificate and wallet-size renewal card;
2. United States Drug Enforcement Administration Registration Certificate AB1152519 which permits me to prescribe controlled dangerous substances in Maryland, and DEA Form 104; and
3. Maryland Controlled Dangerous Substances registration Certificate M15813 issued by the Maryland Division of Drug Control.

Finally, I wish to make clear that I have consulted with an attorney before signing this letter SURRENDERING my license to practice medicine in Maryland. I understand both the nature of the charges against me and also this letter of surrender. I make this decision voluntarily and knowingly.

CYNTHIA A. BROWN MD

On behalf of the Board of Physician Quality Assurance, on this 12th day of March I accept Cynthia A. Brown MD's surrender of her license to practice medicine in Maryland.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Baltimore, MD 21215-0002

RE: Surrender of License
License Number D07094
Case Number: 89-0475

Dear Dr. Weiner and Members of the Board:

Please be advised that I agree to surrender my license to practice medicine in Maryland on February 28, 1990. I understand that I have the right to apply for reinstatement of my license to practice medicine in Maryland in five (5) years, but no sooner than February 28, 1995. This decision is PUBLIC and this letter of surrender will be considered a public document on March 5, 1990.

My decision to discontinue the practice of medicine has been prompted by my guilty plea in the *State of Maryland v. Stanley D. Madison*, Criminal Information #29000328, to the following charges:

(a) one count of Medicaid fraud in violation of Md. Ann. Code art. 27, §230C;
(b) one count of prescribing controlled drugs in violation of Md. Ann. Code arc. 27, §288(b); and
(c) one count of obstruction of justice in violation of Md. Ann. Code art. 27, §27.

My decision to surrender my license and discontinue the practice of medicine has been prompted by my desire to avoid being charged under the Maryland Medical Practice Act, Md. Health Occ. Code Ann. §14-504 (1989 Cum. Supp.). The basis for charges against me is the criminal case mentioned above.

One January 18, 1990, I received notice of the Board's vote on January 15, 1990, to summarily suspend my license pursuant to Md. State Gov't Code Ann. §10-405 and to charge me under Md. Health Occ. Code Ann.

§14-504(a)(28) and (b) (1989 Cum. Supp.).[1] After my attorney, Georgia Goslee, Esquire, informed me of the Board's actions, I agreed to do the following:

1. On January 18, 1990, at 3:00 p.m., I agree to discontinue writing prescriptions for controlled dangerous substances, effective immediately;

2. On January 19, 1990, at 11:00 a.m., in the presence of my attorney, I surrendered the following items to Charles F. Cichon, Case Manager and Investigator for the Board:

(a) Maryland license D07094 (issued 7/27/61);
(b) Maryland Renewal License D07094;
(c) Federal DEA Registration Certificate AM 2421092;
(d) All prescription pads; and
(e) All controlled substances.

3. I hereby affirm that I do not have any DEA order forms for Schedule I or II drugs.

4. I signed DEA Form 104, Voluntary Surrender of Controlled Substances Privileges on January 19, 1990. I acknowledge that the Board will send my DEA Registration Certificate, DEA Form 104 and a copy of this letter of surrender to Robert Bickel, Group Supervisor, DEA, 31 Hopkins Plaza, Room 955, Baltimore, MD 21201.

5. I acknowledge that the Board will send a copy of this letter of surrender to Charles Tregoe, Maryland Division of Drug Control, 4201 Patterson Avenue, Baltimore, MD 21215.

6. My Maryland CDS Certificate M19391 expired June 30, 1987. I hereby affirm that I have not renewed the CDS Certificate since it expired.

7. On January 19, 1990, I gave Ms. Goslee my license to practice medicine in Washington, DC (license #1224122) and my Washington, DC renewal certificate. I acknowledge that on March 6, 1990, the Board will send a copy of this letter of surrender to John P. Hopkins, Executive Director of the District of Columbia Board of Medicine, 605 G Street NW, Room 202 - Lower Level, Washington, DC 20001. Attached hereto is a copy of a letter from me to Mr. Hopkins surrendering my license to practice medicine in Washington, DC and my renewal certificate.

8. My license to practice medicine in Ohio (license #24490) expired December 31, 1986. I hereby affirm that I have not renewed my Ohio license since it expired. I acknowledge that the Board will send a copy of this letter of surrender to Ray Q. Bumgarner, Executive Director of the Ohio State Medical Board, 77 S. High St. 17th Floor, Columbus, OH 43266-0315.

9. I hereby affirm that I do not have any hospital privileges in Maryland, Ohio, or Washington, DC.

In executing this letter of surrender, I understand that I may apply for reinstatement of my license to practice medicine in Maryland, but no sooner than February 28, 1995. The surrender of my license is REVOCABLE, only to the extent that I may apply for reinstatement no sooner than five (5) years from February 28, 1990.

If I apply for reinstatement of my license, I acknowledge that I bear the burden to the Board that I am competent to practice medicine. The Board may require that I take either the National Boards, the Flex Examination, or the SPEX examination and/or be evaluated by the McMasters program in Canada or a similar program. I would bear the cost of any such evaluation. In other words I must demonstrate that I have the cognitive and clinical competence to practice medicine. Additionally, I must demonstrate that I have taken fifty (50) continuing education hours for each year I have not practiced. I understand that I must demonstrate to the Board's satisfaction that I possess good moral character as specified in Md. Health Occ. Code Ann. §14-305(b) (1989 Cum. Supp.).

Until the Board grants my request for reinstatement, I understand that I may not give medical advice to any individual, for compensation or otherwise, and cannot prescribe medication. In other words, I understand that the surrender of my license means that I am an unlicensed physician.

On January 24, 1990, my attorney and I attended the Board meeting and asked the Board to allow me to return to the practice of medicine for four (4) weeks to meet with my patients and dissolve my practice.

On January 25, 1990, my attorney notified me of the Board's decision about my request for the four (4) week extension.

It is my understanding that effective January 25, 1990, at 2 p.m., the Board reinstated my license to practice medicine in Maryland in order for me to dissolve my practice. This extension expires on February 28, 1990 at 6 p.m.

From January 25, 1990, until February 28, 1990, I understand that I cannot write prescriptions for any drugs. However, the Board will allow me to telephone a prescription to a pharmacy, except for controlled substances listed in Schedules I-V, for a patient whom I have treated previously.

Before the Board accepts this letter of surrender as a resolution of this matter, I must present to the Board a copy of the letter to my patients explaining that I am retiring from the practice of medicine giving them the name of the physician to whom I am turning over my practice, and the Medical and Chirurgical Faculty's

1. Section 14-504(a)(28) states: Subject to the hearing provisions of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a licensee if the licensee sells, prescribes, gives away, or administers drugs for illegal or illegitimate medical purposes. Section 14-504(b) states

Subject to the Administrative Procedure Act, the Board shall order the suspension of a license if the licensee is convicted of or pleads guilty or nolo contendere with respect to a crime involving moral turpitude, whether or not any appeal or other proceeding is pending to have the conviction or plea set aside. After completion of the appellate process if the conviction has not been reversed or the plea has not been set aside with respect to a crime involving moral turpitude, the Board shall order the revocation of a license subject to the hearing provisions of §14-505 of this subtitle.

number 301-539-0872. This letter must tell the patients when they can pick up their medical file if they desire, and how they can transfer their files to another physician.

Finally, I wish to make clear that I have consulted with an attorney before signing this letter SURRENDERING my license to practice medicine in Maryland, subject to my right to apply for reinstatement of my license in Maryland no sooner than five (5) years from February 28, 1990, and to practice in any other jurisdiction, state, or country. I understand both the nature of the matters against me and also this letter of surrender fully. I make this decision voluntarily and knowingly.

STANLEY D. MADISON MD

On behalf of the Board of Physician Quality Assurance, on this 5th day of March 1990, I accept Stanley D. Madison MD's surrender of his license to practice medicine in Maryland.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance ■

Josefina Emilia Dado Figueroa

Josefina Emilia Dado Figueroa (Josie) is the 1990-1991 President of the Auxiliary to the Medical and Chirurgical Faculty of Maryland. She is the second State President from Allegany County, the first being Mrs. Leslie Miles in 1973-1974.

Josie and her husband, Augusto, Jr. (Gus) came from the Philippines to the United States in 1965. Josie is a graduate of the University of the Philippines, School of Nursing. After graduation, she worked as an operating room nurse at the Veterans Memorial Hospital in the Philippines, at the Beth Israel Hospital in New York City in 1965-1966, and at the West Virginia University Medical Center as a member of the open heart and the neurosurgery teams from 1966-1970.

Dr. Figueroa is a Board Certified Neurosurgeon in private practice in Cumberland. He is the Regional Medical Consultant for the Rehabilitation Hospital of Altoona, Pennsylvania. Presently, he is the Vice President of the Association of the Philippine Neurological Surgeons in America and the Secretary/Treasurer of the Allegany County Medical Society.

Josie Figueroa

The Figueroas have three daughters. Marijoy, a 1986 graduate of the Johns Hopkins University School of Nursing, is married to David Keenan. She is working in the Neurology/Neurosurgery Critical Care Unit at Johns Hopkins Hospital. Mimi is a Senior (chemistry major) at Loyola College in Baltimore, and Gini is premed student at Frostburg State University.

Josie has been active in the Allegany County Medical Auxiliary since 1973, having served as Recording Secretary, Treasurer, Chairman of various committees, and as County President in 1982-1983.

In the State Medical Auxiliary, she served as Recording Secretary, Corresponding Secretary, Second Vice-President and First Vice-President. She also served two years as Historian in 1984-1986 and was Editor of the *Hygeia Filiae* in 1988-1989. As President-elect, she was the chairman of the Membership-Foreign Born Spouses committee and represented the State President in various functions.

"Teamwork for Better Image" is her theme for the year 1990-1991. She will emphasize teamwork not only within the Auxiliary but also with the Medical Society to improve the public image of the medical community. One of her goals is to encourage the component Auxiliaries to assess the health needs in their communities and work with the Medical Society in supporting on-going or developing new health-related programs.

A membership campaign to educate current and potential members about the importance of federated membership (county, state, national) will be promoted this year. She is planning to invite a national representative to speak on "Federated Membership" at the fall House of Delegates Meeting.

The Auxiliary will be continuing its concerted efforts in promoting legislative matters pertaining to medicine and in sponsoring activities such as the Auxiliary Day in Annapolis to strengthen our relationship with the Legislators.

Josie is a member of the Cumberland Memorial Hospital Auxiliary, the Association of the Philippine Physicians of Maryland Auxiliary, the Auxiliary to the International College of Surgeons, the American Association of Neurological Surgeons Auxiliary, and the Auxiliary to the Congress of Neurological Surgeons.

She enthusiastically commented, "I am confident that with teamwork, you and I will be able to meet the challenges of the coming year." ■

MRI UPDATE

Figure 1

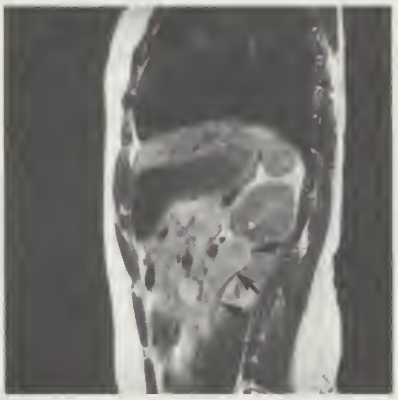

Figure 2

Figure 3

CLINICAL HISTORY: This is a 25-year-old female with complaints of left sided flank pain, nausea, and vomiting.

FINDINGS: Figure 1 represents a coronal T1-weighted image through the kidneys. A lobulated soft tissue mass conforming to the approximate shape of the left renal pelvis and the lower pole collecting system can be identified (large arrow). Signal intensity is intermediate and there is a central area of decreased signal intensity probably representing necrosis. Figure 2 is a sagittal image through the left kidney. In this projection, the soft tissue mass is comma shaped and can be identified extending from the left renal pelvis into the proximal left ureter (small arrows). Figure 3 is a T2-weighted image which exhibits increased signal intensity in the periphery of the mass and central decreased signal intensity. A curvilinear low signal structure lies medial to the mass and is felt to represent the left renal vein displaced by the mass. The vein appears to be patent as evidenced by the low signal intensity indicative of flowing blood (small arrows). No adenopathy is identified. There is no evidence of extension of the mass beyond the margins of the left renal pelvis or the proximal left ureter.

MR IMPRESSION: The location and shape of the soft tissue mass is typical for a transitional cell carcinoma.

MR NOTES: MR of the kidneys is a noninvasive procedure yielding both static and dynamic information about the pathologic process in question. In this case, the MR images defined the presence of the soft tissue mass in the left kidney, the confinement of the soft tissue mass to the left renal collecting system and the proximal left ureter, and the lack of invasion into the kidney and the adjacent pararenal soft tissue structures. In addition, the MR scan demonstrated that there is no evidence of thrombosis of the left renal vein nor is there evidence of tumor into the vein. MR imaging of the kidney is a noninvasive procedure allowing both anatomic identification of renal masses, staging of the extent of those renal masses, and determination of the presence or absence of renal vein involvement for surgical planning.

Adjuvant Therapy in Melanoma Part II: Active Specific Immunotherapy

The main thrust of immunotherapy is the administration of the vaccine in a disease-free environment. The recipient of the vaccine should be immunocompetent to respond to the immune stimulus. Furthermore, immunotherapy is very specific, and there is no general vaccination to protect against all elements.

Most patients who have no widespread metastatic melanoma have intact immune function, evidenced by skin-test reactivity to a variety of standard recall antigens. They are also capable of mounting delayed hypersensitivity reactions to chemical allergens, bacterial and fungal antigens, and *in vitro* to mitogenic stimulations. Therefore, most of them are good candidates for active immunotherapy.

Several approaches of tumor-specific active immunotherapy have been tried:

1. *Soluble polyvalent melanoma antigen vaccine* These soluble antigens were obtained from material shed by a pool of selected allogenic human melanoma cell lines. This was administered intradermally with and without alum as adjuvant. Such a vaccine augmented immunity to melanoma in few patients.[1]

2. *Banked melanoma cells membrane preparations* Partially purified tumor-associated antigens (TAA) were mixed with complete Fruend adjuvant and administered intradermally with some beneficial effects.[2]

3. *Viral lysate of melanoma cells* In an attempt to increase the immune responses to presumably weak tumor-associated antigens, the melanoma cells were superinfected with nonpathogenic oncolytic viruses such as Newcastle disease virus. The utilization of such viral lysates is believed to amplify the immune responses to tumor antigens.[3]

4. *Whole melanoma cell preparations* Some investigators utilize the whole tumor cell in vaccine preparations. It is believed to be more antigenic. It has been noted that only live tumor cells are antigenic and that repeated freezing and thawing results in tumor cell death and loss of its antigenicity. Several approaches have been used to intensify tumor cell antigenicity and to attenuate the cells and prevent them from going into mitosis:

   a. *Neuraminidase-treated melanoma cells* Neuraminidase is an enzyme that strips some of the lipoproteins (neuraminic acid) off the cell membrane, exposing the antigens that can be easily recognized by the immune surveillance. It can be complexed by attaching adjuvants to it for even better recognition. Neuraminidase treated allogenic melanoma cells + BCG repeatedly injected subcutaneously did not appear to have a significant affect in one study[4] and very encouraging results in another study from Duke University.[5]

   b. *Irradiated melanoma cells* Vaccination with irradiated allogenic melanoma cells, alone or in combination with BCG, has received very limited attention. Subcutaneous injection of irradiated allogenic melanoma cells + BCG with intravenous administration of DTIC showed no beneficial effect in one study.[6]

   c. *Mitomycin-C treated melanoma cells* At the University of Maryland, allogenic melanoma cell vaccines were used as adjuvant active immunotherapy in patients with stage II disease, that is, with regional lymph node metastases.

Mitomycin-C was utilized to stop the cells ability from mitosis and to increase tumor cell antigenicity. All the patients underwent radical lymphadenectomy. The first 14 patients that received such therapy had finished 5 to 7 years of follow-up. Their ages ranged from 30 to 66 years (median = 50). They all presented with clinically positive lymph nodes. Pathologically, the number of involved lymph nodes ranged from 2 to 12. Some of the patients had matted lymph nodes.

Four weeks postoperatively, each patient received a single injection of BCG, then was skin tested with PPD (250 TU) two to three weeks later. Each patient (with PPD positive skin test) received 3 sets of vaccines one month apart, then was observed with no further therapy (unless they developed metastosis). Each vaccine consisted of 50 million mitomycin-C treated allogenic melanoma cells with PPD (250 TU).

Seven patients (50 percent) are alive, free of disease at 5 to 7 years (predicted 5-year survival of 10 to 22 percent).

Two new observations have been reported. First, it seems that better immunization can be achieved using autologous tumor cells, or at least histocompatible tumor cells in the allogenic situation.[7] Second, a low-dose schedule of cyclophosphamide 300 mgm per m^2 given intravenously daily x 3 prior to each vaccination will selectively inhibit suppressor cell activity against cellular immune responses and facilitates tumor rejection.[8]

Therefore, in an attempt to improve on our results, we are planning to add two modifications to our vaccine program: 1. Use autologous tumor cells if at all possible. 2. Each vaccine will be preceded by intravenous administration of cyclophosphamide. In addition, patient eligibility will include not only those with positive lymph nodes but also patients with limited metastases who can undergo surgical resection of their disease (creating disease-free individuals). Each patient will receive 5 vaccinations over a 4-month

period. The rationale here is to immunize with the best-available melanoma cells (autologous), and to maintain effective levels of immunity against emergent tumor cell clones.

Future Approaches

It has been reported that the generation of cytotoxic T-cell responses requires not only antigen recognition but also interaction with *T-cell growth factor* also known as *interleukin-2* (IL-2).[9] *In vitro*, IL-2 can induce multilog expansion of the number of lymphocytes.

Another finding is that human peripheral blood lymphocytes cultured with IL-2 generated lymphoid cells can lyse a broad spectrum of tumor cells in addition to autologous tumor, but not normal cells.[10] These are called *lymphokine-activated killer cells* (LAK).

A very important discovery is that lymphocytes recovered from tumors, known as *tumor infiltrating lymphocytes* (TIL) incubated with IL-2, will result in more toxic and more effective antitumor activity than LAK cells was noted *in vitro*. In animal tumor models, fewer TIL were required to induce tumor regression, and their antitumor effects were enhanced by pretreatment with cyclophosphamide.[11,12]

These observations are the beginning of a new and important era in tumor immunology.

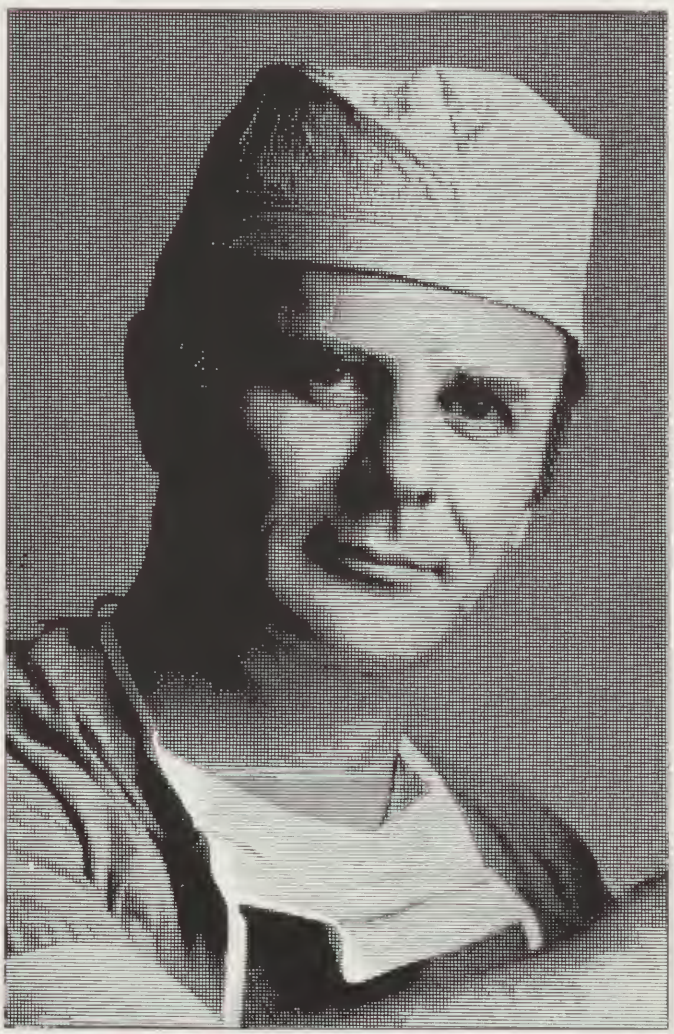
Psychiatry in Opera

Three years ago I was delighted to be invited to join the company of the Baltimore Opera as a supernumerary. My "debut" was in the highly successful Lehrmeyer production of "Turandot." I found myself portraying a number of different roles including the father of a homeless family, an angry priest, an individual assigned by Mr. Busterud to assist in the assassination of the tenor (which fortunately did not take place) and a role, traditional in less creative productions elsewhere, as a standard-bearer. This kind of activity combines the (1) need for a strong back, (2) the ability to stand for what seems like hours at a time, (3) costumes that may be too hot or cold depending on the role, (4) built-in histrionic inclinations, and (5) in the case of the Turandot, an interest in participating in 40 hours of rehearsals.

One might question why a contented and reasonably well thought of academic and clinical psychiatrist was not out of place in such a setting. I was assured firmly by Cynthia Haymon (the highly successful Mimi of the recent "La Boheme" production) that every opera company worth its salt should have a full-time psychiatrist in residence at all times, simply to deal with the pathological interactions between the artists.

My motivation was complex but, I believe, sensible. Having been interested in opera for most of my life, it was fascinating to observe close-up the development of an opera production almost from scratch and to participate in the creation of a work of art among a number of gifted visual and musical artists. Furthermore, drama in the theater and drama among individuals (what psychiatrists spend a fair amount of time dealing with) are not so far apart. Thoughtful students of the human condition, particularly in psychiatry, have often turned to artistic sources to enhance their understanding of psychiatric illnesses. Using themes found in the world of literature since Sophocles, one can understand better not only our patients but also our fellow citizens and ourselves. Opera is unique in its combination of literature, theater, and music and thus has an extended capacity for character delineation. Situations dramatizing the human condition are most appropriately expressed through the human voice.

A list of 300 operas in the current repertoire include 77 suicides of major characters, and since the seventeenth century, madness always has been a popular theme of operas. Particularly in the early nineteenth century opera, a popular pattern of mental illness was often depicted through a leading character as an undernourished woman with a touch of pathos, engagingly fragile, and subject to hysteria. The illness was frequently precipitated by a stressful event, most often unrequited love, which subsequently led to an aesthetic death. These characters performed a display of vocal pyrotechnics encompassing more than two octaves of coloratura. Donizetti, who himself died insane, spent most of his brief but successful career dealing with the theme of madness in his operas, producing 23 mad scenes.



By the beginning of the twentieth century, as a result of great psychiatrists such as Freud and his American counterpart Harry Stack Sullivan (who spent much of his career in Towson), an effective understanding of the factors in the etiology and manifestation of psychiatric illness developed. Simultaneously the understanding of psychiatric disorders in opera was enhanced. Themes of identity conflict, resolution of the Oedipal and Electra complexes, sexual confusion, etc. were convincingly depicted in a number of modern operas. At the same time, the dramatic delineation of these roles changed. In nineteenth century opera performances the singer stood in one spot gesticulating rhythmically if aimlessly. Now singers increasingly turn to mental health clinicians to gain insights that help them communicate motivation and the outcome of psychological conditions. Similarly, mental health professionals use literature (including opera librettos and productions) to teach students about psychiatric disorder.

Here in Baltimore last fall we enjoyed a dramatic production of Strauss's "Salome." If one views this as a current family situation, rather than a portrayal of an Old Testament story, one can gain insights into an entire pathological family matrix. Later this spring we will be able to visit "Otello" and study the deterioration of a marriage and the death of its principals as the result of a pathological paranoid syndrome in the title role.

Thus the relationship between psychiatry and opera is not so far fetched. At least for one psychiatrist it has provided an opportunity to enhance his understanding of people, to learn a good deal about the complexities of opera production, to make a host of new friends, and in general to have a whopping good time participating *quietly* in a noisy but highly professional creative musical event.

ARMY MEDICINE. BE ALL YOU CAN BE.

Peripheral Vascular Disease and Percutaneous Catheterization

Doctor, I have pain in the calves of my legs after walking about a block or going up two flights of stairs. All I need to do to make the pain go away is stop walking for a few minutes, and it is gone. A friend told me that this might be due to smoking, but I stopped when I got diabetes about 15 years ago. Is it due to my age (which is 65) or to my diabetes? What can I do to make it go away or at least keep it from getting worse?

Claudication suggests peripheral vascular disease, a common complication of diabetes. By itself, blockage of the arteries in the pelvis and lower extremities can lead to incapitating claudication. In combination with diabetic neuropathy, chronic nonhealing foot ulcers and impotence can ensue.

In most diabetic patients peripheral vascular disease is a diffuse process involving medium and small arteries. However, when discrete areas of narrowing involve the larger arteries, the new techniques of percutaneous transluminal angioplasty and atherectomy may be indicated. Both techniques are performed via percutaneous catheterization of the involved vessels, as in diagnostic angiogram. In angioplasty, the catheter carries a small balloon, which squeezes open atheromatous plaque creating a larger channel for blood flow. Figures 1 and 2 are examples of pre- and postdilatation of a superficial femoral artery.

In the second technique, an atherectomy device carries a small rotating blade that shaves plaque from the vessel wall into a collection chamber for removal.

Following these procedures, patients are monitored in the hospital overnight and usually discharged the next day. While there is some risk of damage to arteries treated by these techniques, patients do avoid the risk of general anesthesia. Though angioplasty and atherectomy are not useful in the treatment of long occlusions or diffuse disease, some diabetic patients will benefit from their use alone or as an adjunct to surgical procedures such as amputation.

For family physicians and internists the first steps in evaluation of patients with claudication are doppler testing and diagnostic angiography. Percutaneous treatment of short stenoses will help prevent development of foot ulcers and hasten healing of existing ulcers. If foot ulcers can be corrected amputations will not be needed.

Submitted by Janet Storella MD, Radiologist, Suburban Hospital, Bethesda, MD 20814.

Legal and Ethical Concerns of Your Medical Practice

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation, and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIII, Section1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.

■ ■ ■

Guideline for Professional Corporation Names

The Medical and Chirurgical Faculty's Committee on Professional Ethics considers applications for professional corporate names for all corporations with four or more shareholders. Following approval, the Faculty reports its findings to the Board of Physician Quality Assurance. If the corporation/association has less than four shareholders the Faculty is not involved in the approval process.

In all cases, the Maryland Department of Assessments and Taxation should be consulted when a corporate form is being considered. If the entity to be formed requires approval by the Faculty's Ethics Committee, it should submit a letter with the following information:

1. the proposed name of the corporation/association
2. the names of all shareholders
3. the medical licensure number of all shareholders
4. the respective signatures of all shareholders

The letter should be addressed to Erica Parker or Gregory Hall c/o the Medical and Chirurgical Faculty of Maryland, 1211 Cathedral Street, Baltimore, MD 21201-5585.

The following guidelines for professional corporate names should be adhered to:

GUIDELINES FOR PROFESSIONAL CORPORATION NAMES

1. The use of the name of a hospital or other institution can be approved only if:

(a) It is clear that it is the physician members of the medical staff of that institution which have formed the professional corporation, *and*,

(b) Each physician member of the medical staff at the institution is given the opportunity to participate in such professional corporation.

EXAMPLES:
Sinai Hospital Medical Staff Association, P.A.
Medical Staff of Sinai Hospital Professional Association.

In all cases, use of the hospital name must be approved by the hospital. In cases where the members of a particular department of a hospital wish to incorporate, the same rules will apply.

2. The use of the name of a medical school or the term "university" is prohibited. If legal under other statutes, the term "university" would be approved *only* for the University of Maryland Hospital as indicated above.

3. In using the name of a community, area, city, town, village, or other municipality, such names should not connote they are exclusive. Names prohibited would be similar to:

EXAMPLES:
Internal Medicine Association of Salisbury, P.A.
Salisbury Internal Medical Associates, P.A.

Such names would lead the public to believe there are *no other* internal medicine specialties in that community; or would tend to lead the public to believe that this group was the only or best qualified of such specialists. The use of a street name in connection with a professional corporation is permitted, however.

4. If the corporation name includes terms common to business for promotional purposes, such terms should not be false or misleading. Any tendency to "puff" or to bring attention to the name should be avoided. (MC 7/13/71; Compendium Revision 1984)

5. Wherever possible, the title of the group should indicate to the public the type of services rendered, such as psychiatry, dermatology, surgery, etc. Where this is not impractical, letterheads, invoices, etc., should contain the words, "Practice limited to ...", or some other identification that can be readily understood. (MC 7/13/71; Compendium Revision 1984)

6. Professional corporation names may not include the surname of any person unless it is the surname of an individual associated with the professional corporation, except as otherwise provided in these guidelines. (P/PRC 9/18/74)

7. When applying for approval of professional corporation designations applicants shall provide a document recording the signatures of each shareholder and

the serial number of their medical license. (P/PRC 10/26/82)

A sample application letter should resemble the following:

Erica L. Parker, Legal Assistant
Medical and Chirurgical Faculty of Maryland
1211 Cathedral Street
Baltimore, MD 21201-5585

Attn: Gregory Don Hall, Esquire

Re:(Corporation/
Association Name)

Dear Mr. Hall:

This office represents the following physicians who desire to form a corporation/association under the above-referenced name.

Name	Medical License #	Signature
John Doe	D00000	
James Smith	D01234	
Ken Anderson	D02345	
John Smith	D03456	

Please advise this office if the use of the name is acceptable.

Sincerely,
JOHN SMITH MD

GREGORY DON HALL PD, JD, LLM

Mr. Hall is associated with the law firm of Rifkin, Evans, Silver & Lamone, which represents the Medical and Chirurgical Faculty of Maryland.

Announcing a cure for the common computer.

Is your practice computer system chronically ill? Or perhaps you're just not getting access to the information you need? At MEDSOURCE, we have the expertise to diagnose and treat your data problems. Whether it's analyzing data for negotiation with HMOs, coordinating clinical research projects or tracking patient care, MEDSOURCE can provide you with healthy, accurate data every time.

We can assist you in the selection of medical record and accounting systems. We'll install new equipment and train your staff. We can even develop customized programs to help you make new use of existing data.

MEDSOURCE's 13 years of experience in computer programming and our in-depth knowledge of the clinical health care field make us the expert in computer systems for practice management. So, the next time you find yourself diagnosing your computer instead of your patients, call MEDSOURCE.

In Memoriam
Philip Tumulty MD

The recent death of Dr. Philip Tumulty, internationally renowned internist at Johns Hopkins Hospital, has left a void that will be difficult to fill. He represented an era in which internists were considered the premier physicians in the world. The difficult diagnosis was their hallmark. This Sherlock Holmes quality of internists was quickly sought whenever a patient was critically ill and difficult to diagnose.

The uncanny ability of Dr. Tumulty to meticulously detail the history of the patient and weigh such information in the overall management of the patient was a feat that occurred repeatedly; it became Dr. Tumulty's trademark. His stimulating educational abilities with students and faculty was a pleasure and an experience to those in attendance that comes only occasionally in one's lifetime. Sir William Osler would have been truly proud of this individual who followed very closely in his footsteps and exemplified the saying, "Medicine is learned at the bedside and not in the classroom."

For some reason internal medicine is not a popular specialty these days. The financial incentives and the high-tech specialties may have temporarily replaced the diagnosis of tough cases by proper history taking, but medicine will be great again only when the core of its existence depends on the solidarity of the unappreciated internist.

It is with reverence and respect that we note the passing of a great physician, a great teacher, a wonderful educator, and a throwback to Sir William Osler, a model whom medicine needs to embrace and cherish in the days ahead.

Does Incorporation Offer Advantages?

The all-new edition of *A Physician's Guide to Professional Corporations* can help you resolve the question of whether it still makes sense with the new tax laws for your practice to be incorporated.

Available from the AMA, the book explains the pros and cons of incorporation and clearly outlines legal and tax implications. It clarifies the rules of operating a professional corporation by translating this complex issue into common terms using a point-by-point approach.

A Physician's Guide to Professional Corporations, OP 378289, is available at $18 for AMA members ($27 for nonmembers), from the American Medical Association, Book and Pamphlet Fulfillment, PO Box 10946, Chicago, IL 60610-0946 or call 800-621-8335 with VISA or Mastercard to order.

■ ■ ■

Medical Eye Care for the Needy Elderly

You can help elderly patients in Maryland obtain medical eye care if they cannot afford it. Suggest they call the toll-free Helpline of the National Eye Care Project (800-222-EYES). Each qualified caller will be matched with a nearby Maryland ophthalmologist who has volunteered to provide medical eye care for disadvantaged elderly at no out-of-pocket cost to the patient. If the elderly person is covered by Medicare or other health insurance, the physician has agreed, for this project only, to accept insurance assignment as payment in full. If the patient has no medical insurance, the care is free.

To qualify the patient must be age 65 or older and a US citizen or legal resident. The patient must no longer have access to an eye physician and surgeon (ophthalmologist) he/she has seen in the past. This is NOT an eyeglasses program, and prescription drugs or hospital care are not provided. The National Eye Care Project is designed to detect and treat eye disease, which is prevalent among the elderly and a frequent cause of blindness.

The National Eye Care Project is sponsored by the Maryland Society of Eye Physicians and Surgeons and the Foundation of the American Academy of Ophthalmology. Since the project began four years ago, more than 4,270 Maryland residents have called the NECP Helpline, and more than 2,813 needy elderly within the state have been referred to volunteer ophthalmologists.

In Maryland, the following numbers of potentially blinding eye diseases have been detected and treated in 1,590 patients from whom records are available:

845 cases of cataract
83 cases of glaucoma
179 cases of macular degeneration
35 cases of diabetic retinopathy

"It is estimated that more than half of all blindness is preventable, and the elderly are particularly vulnerable to eye disease," said Robert A. Liss MD, president of the Maryland Society of Eye Physicians and Surgeons. "We urge all disadvantaged elderly people who need medical eye care to call the toll-free Helpline for prompt assistance." ■

The Front Lines of OB.

Not for the faint-hearted. But for those who want to make a difference. **Sunlife** has a bold, aggressive program–caring for uninsured and unassigned patients at **PRINCE GEORGE'S HOSPITAL CENTER** in Cheverly, MD. Just minutes from cultural center of Washington, D.C. Excellent compensation, professional liability insurance, attractive on-call schedules and new, modern OB/Peds wing.

Immediate openings for BC/BE OB/GYN physicians.

Join the Sunlife team.

Questions of Community Leadership

Heart attack care: Test your leadership ability.

Today, community leadership means healthcare leadership. Number one on everyone's personal health agenda—and the No. 1 adult killer in the U.S. today— is **heart attack**. It's your No. 1 concern, as well.

Early cardiac care is critical to saving lives. Do you know how effective the early heart-attack care is in your community? Consider these questions:

- Has your hospital implemented educational outreach programs, that encourages early entry for patients experiencing beginning signs of a heart attack?
- If patients with mild chest discomfort (recurrent in nature) present themselves at your hospital, is there a "user friendly," appreciative attitude for the patients' attention to even minimal heart attack symptoms?
- What is the time delay for getting clot-dissolving agents, and is this started right away in the emergency room?
- What percent of the total heart-attack patients reaching the hospital, actually receive the clot-dissolving agent.

Take responsibility for the cardiac care in your community. Educate your fellow citizens on the importance of the early recognition of heart-attack symptoms. Now, that's caring community leadership from the heart.

Free VCR tapes are available on how to set up early cardiac care in your hospital's emergency room and network with the community using an educational heart attack outreach program.

Call **(301) 368-3217,** or write to Dr. Raymond D. Bahr.

Why buy an office automation system that doesn't offer a long-term solution?

ACCLAIM™ from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

IBM® and compatible hardware.

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

Long-term support.

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people are always there to make sure your system fits your needs over the years to come.

Easy to operate.

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.

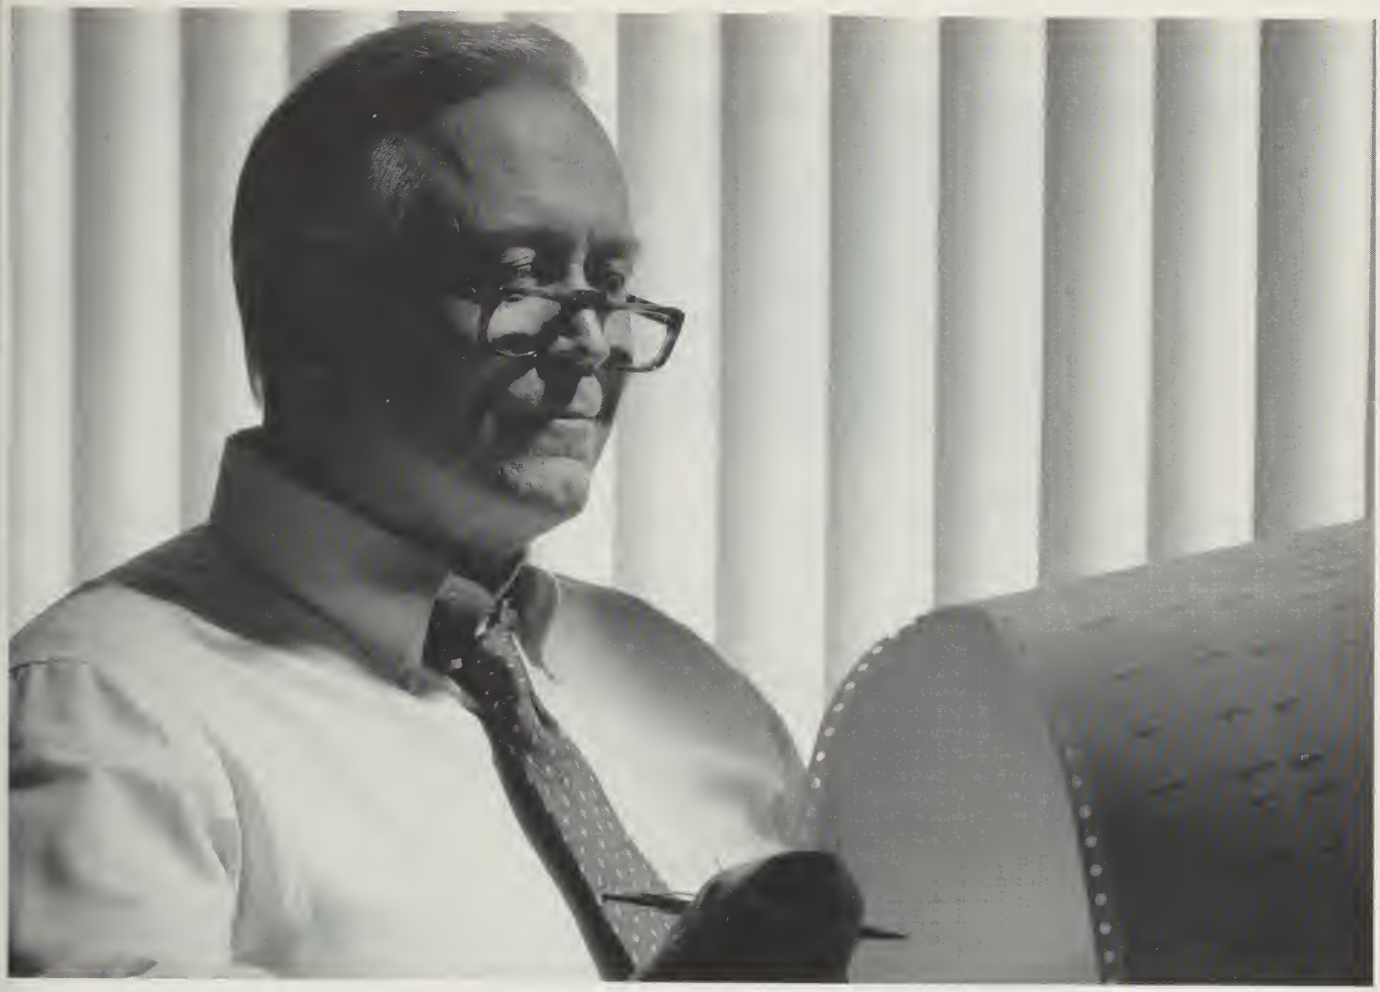
Maryland Physicians: Thanks To You, It Works.

The history of Medical Mutual is really the story of physicians working together to surmount complex problems which had defeated others. Through cooperation, persistence and the strength to make difficult decisions, the physicians of Maryland have set an example for the rest of the country.

It all began, of course, in 1975 when the major medical malpractice insurers announced they were leaving Maryland. Spiraling malpractice awards and the prospect of large-scale losses, the companies said, made it impossible to do business in Maryland. As the potential threat to public health became evident, many people feared that health care delivery in the State was on the verge of collapse.

With no relief in sight, physicians, citizens, and the General Assembly worked together to create what had never before existed anywhere — a medical professional liability insurance company owned and directed by its physician members. On June 3, 1975, Medical Mutual was created.



Over the past 15 years, other companies have come, and gone, and come again — entering Maryland when there were profits to be carried away, and leaving whenever times got tough. Through it all, Medical Mutual's physicians have proved that their long-term commitment was the right choice.

For 15 years, our thousands of physician members have been at the heart of what we are, and we are unique because of your needs, your insight, and your guidance.

The success we have earned was by no means universally predicted in 1975. But we survived those difficult first years, and now, 15 years later, we are proof of what physicians can do when they work together for a common goal.

Thanks to you, it works.

Three financial reasons why practices choose the ACCLAIM™ Medical System

There are many compelling reasons to automate with the ACCLAIM Medical System. Here are three important benefits our customers have taken the time to write to us about:

1 Improved Cash Flow

"We have seen dramatic improvements in the efficiency of filing insurance claims and tracking accounts. We've also seen substantial improvement in our accounts receivable."

Susan Shaffer, Office Manager
Single Physician Practice

2 Increased Productivity

"The system is easy to use, straightforward in its commands and simplifies medical office management beyond belief."

Judy Greenburg, Office Manager
Four Physician Practice

3 Financial Control

"Sentient's ACCLAIM system has improved our collections by 100% and has provided reliable data on which to base practice management decisions."

Frank J. Mayo, M.D., Pulmonologist

Sentient Systems offers total solutions. Hardware (IBM® and compatible), software, installation, data conversion, training, support and service are a part of every system. We provide the highest quality medical system available today. Just ask our customers.

Baltimore County General Hospital: A Community, Non-Teaching, General Hospital 641
Florence Dietz, Robert W. Fischer, Elmer Hoffman MD, FACS

Diabetic Retinopathy: Recent Advances to Eliminate Treatable Blindness 643
Edward Jay Goldman MD

Recent advances in the management of diabetic retinal vascular disease are of potentially great benefit to the patient. The primary care physician plays an increasingly important and responsible role in directing patients to the care they need to help preserve their sight.

Advances in the Electrodiagnosis of Nerve Injury 649
Ira Wexler PhD, MD

Needle electrode nerve conduction recording is a powerful complement to the traditional techniques of EMG sampling of muscle and surface motor conduction measurements.

Functional and Cosmetic Surgery of Nose and Ear Deformities in Children and Adolescents 655
N. Edward Nachlas MD, Ira D. Papel MD, and Albert Steiner MD

Because congenital and traumatic disorders of the nose and ear in children and adolescents may be the result of many different factors, each patient must be dealt with on an individual basis.

Immediate Reconstruction after Mastectomy: Team Approach 661
Elmer Hoffman MD, FACS; Stanley A. Klatsky MD, FACS; and Alan S. Davis MD, FACS

A review of 198 cases of breast reconstruction done at the time of mastectomy for carcinoma of the breast shows an extremely low morbidity. The technique of using a tissue-expander prosthesis enables immediate breast reconstruction without any fear of impairing prognosis, of spreading disease, or of impeding adjuvant therapy.

Liposuction: Blood Loss and Autotransfusion 667
Mitchel A. Kanter MD and William R. Kanter MD

Blood loss usually is not clinically significant during liposuction, but the need for transfusion increases with the amount of tissue removed. Autologous blood donations in preparation for significant blood loss are widely accepted by patients and physicians.

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

MARYLAND DIAGNOSTIC IMAGING CENTER

7120 Contee Road
Laurel, Maryland 20707

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

July 1990

Selected Communicable Diseases in Maryland in 1989

This report briefly describes the epidemiology of selected communicable diseases in Maryland in 1989, reported from local health departments, hospitals, physicians, other health professionals and laboratories. For many diseases additional information was obtained from the active surveillance system maintained by communicable diseases coordinators in the local health departments and by hospital infection control practitioners. The number in parenthesis after the name of each disease indicates the reported cases with onset of illness in 1989. Following, is the incidence rate in Maryland (based on the number of cases reported in 1989 and the Maryland Department of State Planning population projections for 1990, rev.87),and then the U.S. incidence (based on the cumulative number of cases reported to the Morbidity and Mortality Weekly Report system in 1989 [from: CDC.MMWR 1989, Vol.38, Nos. 51 & 52] and the U.S. Bureau of Census population estimate on July 1, 1989).

ENCEPHALITIS (23)

PRIMARY AND POSTINFECTIOUS

0.5/100,000 (U.S. - 0.4/100,000)

In Maryland more than half (56.5%) of all cases occurred in the Montgomery - Prince George's area. In Prince George's county 7 of a total of 8 patients had onset of illness in April and May. They were between 11 months and 72 years of age. No common infectious agent was identified. The number of cases by county is shown in Table 1. Overall the peak incidence (7 cases) occurred in April; no seasonal pattern was observed during the rest of the year. The male to female ratio was 0.9:1.0; the ratio of whites to nonwhites was 1.9:1.0. The age ranged between 11 months and 79 years (mean 31.2 years); 34.8% of the cases were 19 to 24 years of age, the peak affected age group. Three patients died for a case fatality rate of 15.8 percent; the outcome for 4 cases was unknown; the rest recovered. The following infectious agents or illnesses caused or were suspected to have caused the cases: Herpes viruses (8 cases, including 1 post-shingles and 1 post-varicella case), Epstein-Barr virus (1), rotavirus (1) and eastern equine encephalitis (EEE) virus (1). The EEE, was confirmed by serum IgM antibody positive test in a 58-year-old resident of the Eastern Shore in early October. The patient died within 24 hours of onset of seizures. No specific exposure was identified, but EEE among pheasants and equines in the area had been observed since July.

GONOCOCCAL INFECTIONS (23,194)

501.3/100,000 (U.S.298.0/100,000)

Reported gonococcal infections rose by 12 percent over the number reported in 1988 (Figure 1). This increase is the first noted since 1985. At the same time, the cases of penicillinase-producing Neisseria gonorrhoeae (PPNG) rose by 81 percent from 1328 (6.3%) in 1988 (U.S.- 3.2%) to 2405 (10.4%)

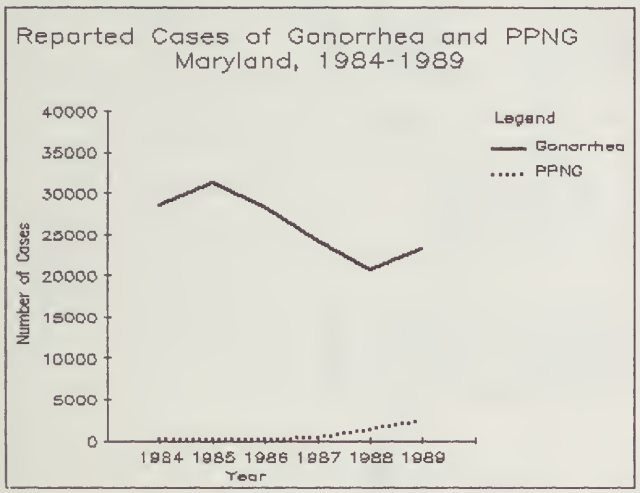

Figure 1

in 1989 (U.S.-7.4%). Baltimore City, Dorchester, Prince George's and Wicomico counties showed the highest incidence rates (1501.3, 1495.0, 917.4 and 808.2/100,000, respectively). The number of cases in each county is shown in Table 1.

Thirty-three percent of all reported gonorrhea cases were among 20 to 24 year olds, 32 percent were 15 to 19, 23 percent were 25 to 29, and 12 percent were 30 to 34 years old (Figure 2). Where race information was reported, data show that 93 percent of male cases and 86 percent of female cases were among blacks.

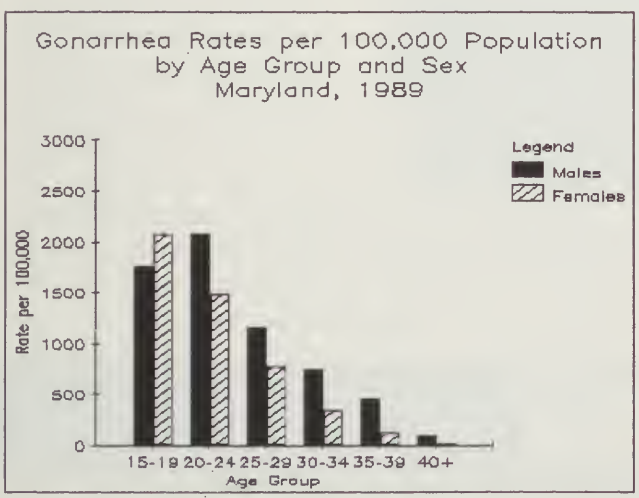

Figure 2

HAEMOPHILUS INFLUENZAE DISEASE (73)

1.6/100,000 (U.S. - Not Available)

The number of reported infections declined by 40 percent--73 cases in 1989 compared to 122 cases in 1988. The type of reported invasive H. influenzae illness is shown in Figure 3.

Cases were reported from 12 counties and Baltimore City (Table 1) and occurred throughout the year. The male to female ratio was 1.3:1.0. The incidence rate in males was 1.8 per 100,000, and in females - 1.3 per 100,000. The incidence rate in whites was 1.1 per 100,000, and in nonwhites - 2.6 per 100,000.

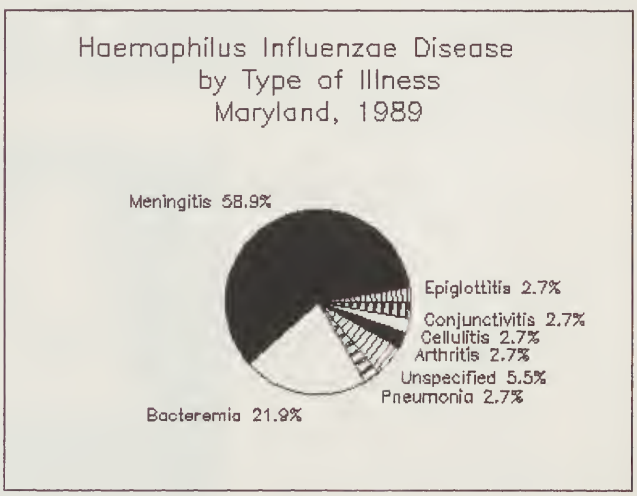

Figure 3

Forty-nine (67.1%) of the cases were less than 18 months old, including 8 (11.0%) neonates, 13 infants 1-5 months old, 18 infants 6-11 months old and 10 children 12-17 months old. None of these were vaccine preventable. Figure 4 shows the age group distribution of meningitis cases only.

Seventeen (23.3%) of the patients were eligible for vaccination (18 months to 5 years of age). Of these 2 (11.8%) had been immunized before the onset of the illness, 5 (29.4%) had not been vaccinated, and 10 (58.9%) had unknown vaccination status.

Information on the ampicillin resistance of H.influenzae isolates from 31 patients

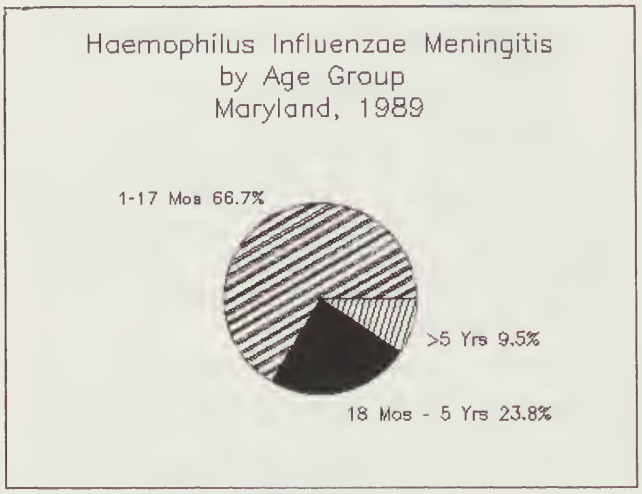

Figure 4

showed that 29% were resistant to ampicillin, a decrease from 42 % in 1988 (Figure 5). Two of the ampicillin-resistant isolates from patients with meningitis and bacteremia/otitis/arthritis, were resistant to chloramphenicol as well.

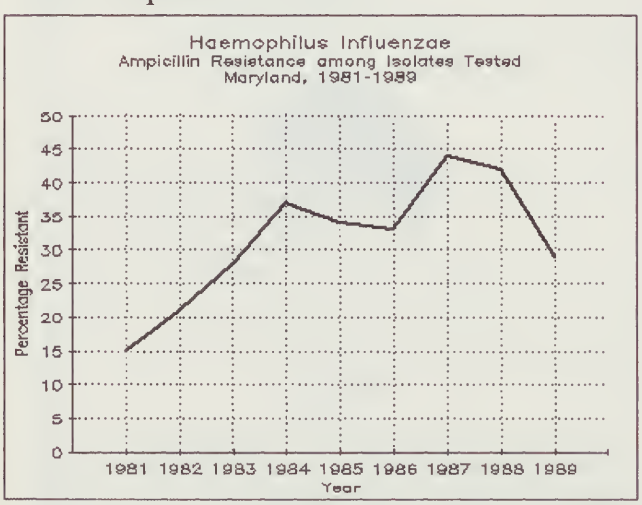

Figure 5

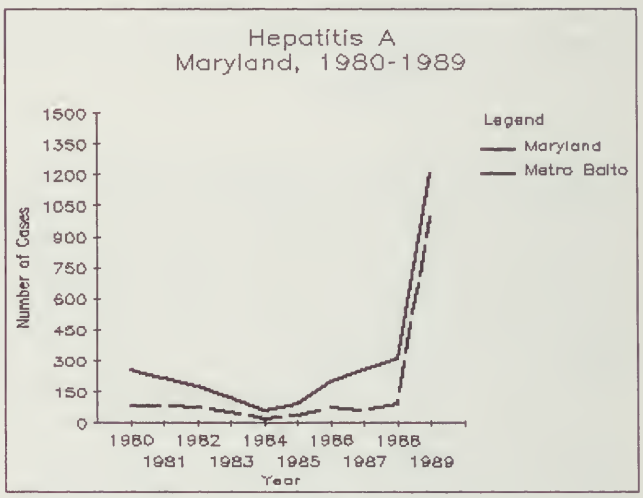
HEPATITIS A (1200)

25.7/100000 (U.S. 14.1/100,000)

The dramatic tripling of reported cases of hepatitis A in 1989 (Figure 6) is almost entirely explained by a discrete outbreak in Frederick County in January through April and an ongoing epidemic in the metropolitan Baltimore area, including Baltimore City, Baltimore County, and Anne Arundel County. The number of cases by counties are shown in Table 1.

Almost half of the patients (46.4 %) had onset of illness between August and November. The male to female ratio was 1.4:1.0 (1.3:1.0 in whites, 2.3:1.0 in blacks and 0.7:1.0 in Asian, Hispanic and other race/ethnic groups). Half of all cases (49.8%) were 20 to 34 years of age; 9.2 % and 9.8 % were 5 to 9 and 35 to 39 years old, respectively. The highest rate (142.8/100,000) was seen in white males, 25 to 29 years old.



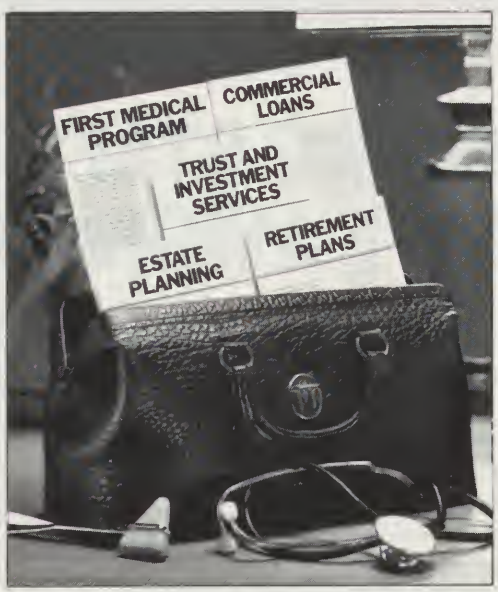


Figure 6

The diagnosis of 93.2% of the reported cases was confirmed by a positive hepatitis A IgM antibody test. A known or suspected source of infection was reported for only 379 (31.6%) of the cases. Of these, 187 (49.3%) had contact with a confirmed or suspected hepatitis A case, 86 (22.7%) used illegal drugs (compared to 13% in 1988), 38 (10.0%) were food handlers and/or had consumed potentially contaminated food, and 68 (17.8%) had other sources of exposure. A recent more detailed study showed that 75 of 169 (44.4%) cases over 15 years of age in Baltimore City and 24 percent of cases over 10 years of age in Baltimore County, used illicit drugs.

Continued next month.

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.

To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

YOUR OFFICE STAFF WOULD LIKE TO HAVE A WORD WITH YOU

If you're suffering from an upset staff due to billing frustration and overexertion, CADO SYSTEMS has the right prescription for a healthier practice — MENDS II, from VERSYSS INCORPORATED (formerly Contel Business Systems). With over 3,000 installations nationwide, MENDS II is the practice management system designed with your office in mind. It can help you eliminate problems with your accounts receivable management. It can also assist your staff with patient tracking and follow-up, giving you better control of appointments, patient histories, and treatment scheduling. CADO is your single-source solution. From automatic insurance billing, electronic claims submission and general accounting to medical records, data base analysis and word processing, we take care of your practice so you can take care of your patients. We are the "one stop shop" for your entire computer system — including hardware and software selection, financing, installation, service and support.

CADO SYSTEMS has been serving the central Maryland area since 1981 and will continue to do so far into the future.

For you to benefit from our single-source expertise in health care computerization, call us at (301) 581-1212. When it comes to curing practice management problems, we are the specialists.

CADO SYSTEMS — WE OFFER PRACTICE MANAGEMENT SOLUTIONS, NOT JUST COMPUTERS!

Adjuvant Immunotherapy in Patients with Melanoma: A New Approach

Extensive experimental studies in human tumor immunology indicate that melanoma is an immunogenic tumor. A variety of *in vitro* and *in vivo* generated data strongly suggest the presence of tumor-associated antigens (TAA) and have detected tumor-specific cellular and humoral immune response. The majority of melanomas have a common antigen that is immunogenic in patients with this disease. There is clear evidence that melanoma patients' lymphocytes develop cytotoxic activity against tumor cells in the early stage of the disease but lose it in the advanced stages.

The question why such immune response diminishes and cannot be detected clearly in cancer-bearing patients remains unanswered although there are several theoretical explanations. One possibility is the weak antigenicity of the tumor may not elicit a strong host reaction. Several attempts have been made to enhance tumor cell antigenicity by attaching BCG, its derivative PPD, or BCG in the form of complete Freund's adjuvant as an immunogenic carrier determinant into the tumor cell surface. Immunization with such coupled tumor cells does potentiate a marked antitumor response even to tumors that are very weakly antigenic.

Sensitization with mitomycin-C treated tumor cells seem to produce pure cell-mediated immunity with no detectable humoral component that may trigger blocking factors. Attempts to sensitize melanoma patients with irradiated tumor cells revealed that the lymphocytes became cytotoxic to the melanoma cells one week after sensitization, but it disappeared three weeks later. Furthermore, it has been suggested that although tumor cells could initially stimulate antitumor response, it is subsequently suppressed by massive tumor growth. The mechanism for this phenomenon might be due to the generation of antigen-specific suppressor T-cells. Such tumor-specific suppressor cells have been demonstrated in various tumor-bearing animal models. The attempts to selectively eliminate T-suppressor cells led to the discovery that low doses of cyclophosphamide (cytoxan) can specifically affect suppressor T-cell population. It also has been shown that cytotoxic T lymphocytes can lyse autologous and histocompatible melanoma cell, but not incompatible allogenic melanoma cells.

In an attempt to establish active immunization of patients with melanoma, several attempts have been made using vaccines: (1) isolated TAA, (2) melanoma antigen prepared from material shed into culture media from pooled allogenic human melanoma, and (3) melanoma lysates. Such attempts showed different degrees of success. However, we and others have shown that viable tumor cells are more immunogenic than any extracts of these cells. We also have emphasized that tumor-specific immunotherapy is more beneficial if administered to patients with low tumor load (that is, grossly tumor free) but who have a guarded prognosis.

In one of our previous clinical trials in melanoma, fourteen patients with clinically enlarged regional lymph nodes who underwent lymphadenectomy and were found to have metastases in two to twelve lymph nodes, received adjuvant immunotherapy. They were vaccinated with mitomycin-C treated homologous melanoma cells in PPD (250 TU), after being converted to PPD positive skin test after receiving BCG. These vaccinations were administered intradermally, once a month, on three occasions. At five to seven years of follow up, seven patients (50 percent) are alive free of disease, compared to less than 10 percent expected survival in the historical controls who were treated by surgery and received no vaccination. Encouraged by these results, we are pursuing and expanding our immunization program to include not only patients with regional metastases but also those with limited distant metastases that can be surgically resected.

In our new tumor vaccine program we are using (1) autologous tumor cells (from patient's own tumor), (2) cyclophosphamide injections prior to each vaccination, and (3) five vaccinations over a four-month period. This is an attempt to improve the immunization according to the new data.

Drug Conference

Every physician plays a critical role in the war on drugs. To help you recognize problems associated with alcoholism and drug addiction, Med Chi is offering a seminar on "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician" on Saturday, October 20, and Sunday, October 21, 1990 at the Baltimore Convention Center. Physicians attending the conference will hear talks by noted professionals including, Robert DuPont MD, former Director of the National Institute on Drug Abuse, and Sidney Schnoll MD, PhD from the Division of Substance Abuse at the Medical College of Virginia. Topics for the seminar include management of cocaine and heroin abuse, recognition of the addict in a clinical setting, and legal aspects of treating the addict. Med Chi designates 10 Category 1 CME credits for this seminar and will present certificates of attendance to all participants. To register for the program contact Michael Llufrio at 301-539-0872 or toll free at 1-800-492-1056.

Med Chi Semiannual Meeting

"More clearly than any other, the physician should illustrate the truth of Plato's saying, that education is a lifelong process." -From an address Sir William Osler delivered in London, July 4, 1900.

Mark your calendar!! The Semiannual Meeting will be held at the Royal Princess Hotel, Ocean City, MD, Thursday, September 13 thru Saturday, September 15, 1990. To make hotel reservations call 1-800-63-ROYAL.

Music Medicine Clearinghouse Update

During the 1989-90 year, Clearinghouse holdings increased to over 600 reprints, a large collection of books, and extensive files of other materials such as brochures from arts medicine clinics, meeting advertisements, and conference abstracts. The Clearinghouse sponsored a session at the Faculty's Annual Meeting focusing on vocal disorders of singers, and featuring speakers from the local Voice Study Group. Coordinator, Susan Harman, gave presentations at the National Flute Association annual convention, the Arts Medicine Information Management Mini-symposium, and the Special Libraries Association annual conference. She completed a chapter on the history of the field to be included in the *Textbook of Performing Arts Medicine*, forthcoming from Raven Press. The Clearinghouse is cooperating with other arts medicine organizations and the Hogeschool Nijmegen in the Netherlands to set up a national database similar to one under development in Europe. In cooperation with the Players' Committee of the Baltimore Symphony Orchestra, music medicine information is being supplied to their musicians at regular intervals.

Regional Hansen's Disease Program

The Regional Hansen's Disease Program (RHDP) provides medical services to Hansen's disease patients throughout the U.S. In order to achieve the program's goal of providing care in each patient's community, a nationwide network of over 900 physicians has been developed. Network physicians represent numerous medical specialties and have varied backgrounds, but share a common interest in managing patients with Hansen's disease. There are approximately 6000 patients with Hansen's disease in the U.S. and the RHDP has identified 3700 of these patients as currently being under treatment. To identify additional cases, RHDP requests that any Maryland physicians treating Hansen's disease patients contact RHDP.

Physicians who choose to utilize the program's resources can obtain medications, patient education materials, insensitive limb screening materials and clinical literature at no charge. Physicians with an interest in managing

patients with Hansen's disease can be placed on the program's referral list. Interested physicians should contact Mr. Larry Pfeifer, Clinical Coordinator, at 1-800-642-2477.

Medicare Claims Submission Requirements

Physicians are reminded that effective July 1, 1990, Medicare assigned claims will be denied if ICD-9 codes are incomplete or inaccurate. Unassigned claims will be referred to the HHS Inspector General for failure to submit complete or accurate ICD-9 codes.

Effective September 1, 1990, physicians must submit all Medicare claims to carriers regardless of the assignment decision. Medicare carriers will initiate a congressional mandate to profile individual physicians whose practice patterns vary significantly from peer group norms. This activity is not punitive but rather an educational effort to advise physicians of practice variations.

For questions regarding the 1990 changes in Medicare, physicians should contact carriers in their area. In Prince George's and Montgomery Counties, contact Pennsylvania Blue Cross and Blue Shield at 717-763-5700. All other physicians should contact Maryland Blue Cross/Blue Shield Provider Relations at 301-561-4057 or 301-561-4058.

AMA Address, Phone Change

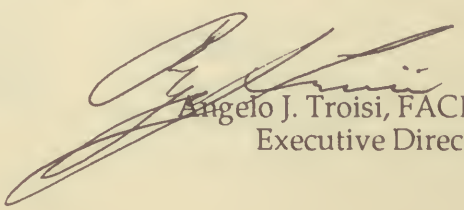
The staff of the AMA will be moving into leased space in a new headquarters building in Chicago, beginning August 16, 1990. Most of the AMA staff will move over an 11-day period and all will be in their new offices by August 27. The new AMA address will be 515 North State Street, Chicago, IL 60610. The new general office phone number will be 312-464-5000.

Workers' Compensation Commission

The following letter from the Maryland State Workers' Compensation Commission was received by the Faculty's Occupational Health Committee which requested it be published in its entirety:

Dear Mr. Troisi:

Please find enclosed a copy of a "Health Insurance Claim Form." This form indicates that it has been approved by the AMA Council on Medical Services. These claim forms are being mailed to our Commission by health providers with the mistaken idea that the Commission issues the checks for payment.



Under the Workers' Compensation Law, the employer and workers' compensation insurance carrier are responsible for the payment of the medical bill. If a health provider does not know the name of the insurance carrier, the bill is to be forwarded to the employer with the request that it be sent to the carrier for payment. If the employer does not carry workers' compensation insurance, the employer is responsible for payment.

I am bringing this problem to your attention because the Commission does not have the personnel to individually contact the health providers and advise them of the procedure or to return the "health insurance claim form." I am asking on behalf of the Commission if you will, through your newsletter, advise the physicians and/or health providers of the proper procedure for filing their claims for payment.

One final note-- if the health provider's bill is refused for payment by the insurer, they may file a claim with this Commission, Form C-51, but this is only to be filed after the bill has been refused or ignored.

Thank you for your consideration in this matter.

Very truly yours,
Lourenna E. Fisher
Secretary to the Commission.

Angelo J. Troisi, FACHE
Executive Director

If You Are Looking For A High Quality Clinical Laboratory With A Strong Commitment To Personalized Service, Then Call . . .

SmithKline Beecham Clinical Laboratories

The One Lab For Your Clinical Testing Needs

Accurate Results

At SBCL, accurate results are no mistake. By constant checking and recalibration of equipment, blind submission of control samples, regular participation in federal, state and independent proficiency programs, and a multi-tiered quality control system that evaluates every phase of testing, we ensure you get accurate results – each and every test. And, our professional staff is available for consultation.

Service

From the top down, the people of SBCL take pride in meeting your individual needs.Whether it is the courtesy and knowledge of a client service representative, or the cooperation of your sales manager or help from a field service representative, you'll discover your needs are important to us. We also offer direct billing to insurance providers and continuing education programs.

Test Availability

SBCL offers over 1400 tests from the routine to the rare. With a trained staff and sophisticated instrumentation, we are able to respond rapidly to all your testing needs at our new facility located in Owings Mills, MD.

PROVIDING BILLING SERVICES SINCE 1953

Computer Solutions Plus, Inc., 1055 Taylor Avenue, Suite 208, Baltimore, MD 21204

Baltimore County General Hospital: A Community, Non-Teaching, General Hospital

Florence Dietz, Robert W. Fischer, and Elmer Hoffman MD, FACS

Florence Dietz is Chairman of the Board of Trustees, BCGH; Robert W. Fischer serves as President and CEP; and Elmer Hoffman MD is Chief of the Department of Surgery.

One often hears questions about the role of a community, non-teaching, general hospital. There is particular emphasis placed on this role when the hospital is located in a city containing two major medical schools and their hospitals. There is a vital role for the well-integrated and well-organized non-teaching community hospital to perform.

This is the 25th anniversary for Baltimore County General Hospital's providing health care services to the Northwest Baltimore Metropolitan area. In this period, the hospital has seen an increase from 94 to 240 beds, all private rooms.

In our quest for medical excellence we bring to the community populations served, the advances (technological, therapeutic and research) of academic institutions while maintaining independence of thought and action. We do all of this through a well-trained, well-disciplined, well-organized medical staff which continually demonstrates its skills and excellence. We view our responsibility for the health care of the community as paramount to our existence.

During the 25 years of its existence, Baltimore County General Hospital has kept pace with all of the startling technological and therapeutic advances in medicine in order to meet our goal of providing the finest possible health care services.

The article by Dr. Goldman places emphasis on the role of our ophthalmological division in the care of diabetic retinopathy. The article by Dr. Wexler reflects the activity of the neurology division. Some of the advances in cosmetic surgery are discussed in the article by Drs. Nachlas, Papel, and Steiner (Cosmetic Surgery of the Nose and Ears), in the article by Drs. Hoffman, Klatsky and Davis (Immediate Breast Reconstruction Following Mastectomy for Malignancy), and in the article on Liposuction by the Drs. Kanter. Drs. Hoffman and Chang report their experience with the handling of Non-Parasitic Splenic Cysts. Ano-rectal Carcinoma is discussed by Dr. Berg. The article by Drs. Hoffman, Davis and Glasser deals with the results of cholecystectomy in a non-teaching community hospital, and compares those results at BCGH with the literature. They also describe the mechanics and logistics of surgical care at a non-teaching community hospital.

We sincerely hope that the articles in this issue of the *MMJ* will prove valuable to you and give you a small glimpse into the functioning of BCGH. ■

POS Physicians Office System

"With POS, you get the strength and stability of SMS, the leading provider of healthcare information systems, combined with the personalized service that you would expect only from a small company."

In today's demanding and ever changing healthcare environment, you need an information system that will help you meet business challenges and competition head-on.

SMS' Physicians Office System (POS) can give you that edge. POS is a comprehensive medical information system offering all the features required by large clinics, but designed specifically for solo and group medical practices.

- **Advanced Features.** POS capabilities go far beyond billing office functions - they also include extensive management and clinical tools, HMO support, automated appointment scheduling and physicians access to patient information residing in your hospital's system.

- **Backed By The Industry Leader.** POS system software is developed and offered by SMS, the leading provider of healthcare information systems in the U.S. and Europe. With over 20 years of experience and 10,000 physicians as clients nationwide, SMS will be around to support you not only today, but in many years to come.

- **State-Of-The-Art Hardware.** POS runs on state-of-the-art IBM hardware that is easily expandable and adaptable to future requirements. With IBM, you can be sure that your medical information system uses the best and most valued hardware in the marketplace.

But most importantly - POS is delivered with a personal touch. SMS representatives are involved with our clients from the moment they choose our system. We provide continuity by guiding them through both their training and system installation. And we are always available to answer questions and to help them accommodate new regulatory requirements.

Call us today - and learn more about the POS personal touch.

Diabetic Retinopathy: Recent Advances to Eliminate Treatable Blindness

Edward Jay Goldman MD

From the Division of Ophthalmology, Department of Surgery, Baltimore County General Hospital. Reprints: Edward Jay Goldman MD, The Retina Center, 4000 Old Court Rd. - Ste 200, Baltimore, MD 21208.

Recent advances in the management of diabetic retinal vascular disease are of potentially great benefit to the patient. The primary care physician plays an increasingly important and responsible role in directing patients to the care they need to help preserve their sight.

In the last 20 years great progress has been made in the management of diabetic retinopathy. Previously we could only diagnose and observe the complications that cause vision loss. Now we are able to manage many of the challenging complications to avoid and often reverse the loss of sight. The American Academy of Ophthalmology recently announced as its goal the elimination of blindness from diabetes by the year 2000. This can best be done by improved communication between the various specialties. It is hoped this goal can be attained by keeping those who manage the primary care of the diabetic patient informed of the rapid progress in ophthalmology.

Pathophysiology

The initiating event of the retinal vascular changes probably is the selective loss of the capillary pericyte. This mechanism involves the influence of several biochemical routes that are abnormally active in the diabetic patient. One such pathway involves the enzyme aldose reductase, which is active inside the pericyte. The accumulation of sorbitol secondary to the chronically elevated glucose is toxic to this cell.[1] An additional proposed mechanism concerns the accumulation of advanced glycosylation end products in the vessel walls.[2] This process involves complicated nonenzymatic pathways and is related to the degree of microvascular involvement directly related to disease duration. The loss of the pericyte function causes a change in capillary permeability resulting in leakage from the decompensated retinal vascular bed leading to the development of edema in the retina.

Further damage to the microvasculature may lead to a profound progressive capillary occlusive process. The intact retinal vessels respond by allowing the rerouting of blood through existing channels. The clinical picture of dilated, irregular veins often can be seen accompanying the cotton-wool spots that signify infarction of a capillary in the nerve fiber layer of the retina (see Figure 1). The findings commonly associated with retinal vascular incompetence include intraretinal hemorrhage, exudate, and vascular sheathing.

In the eye that has suffered extensive ischemia from capillary occlusion there is a misdirected effort to revascularize the ischemic tissue with new vessels that begin to form outside the plane of the retina. This tissue behaves in a distinctly abnormal manner in comparison to the original retinal vessels. The new channels leak their contents into the vitreous cavity. The resulting interaction leads to localized fibrous traction from the altered vitreous on these vessels, which can cause a sudden hemorrhage into the eye. If the fibrin-collagen network of neovascular tissues and scar adheres to the retina, a localized traction detachment can occur with subsequent loss of vision. An example of extensive neovascularization and focal traction on the retina is shown in Figure 2.

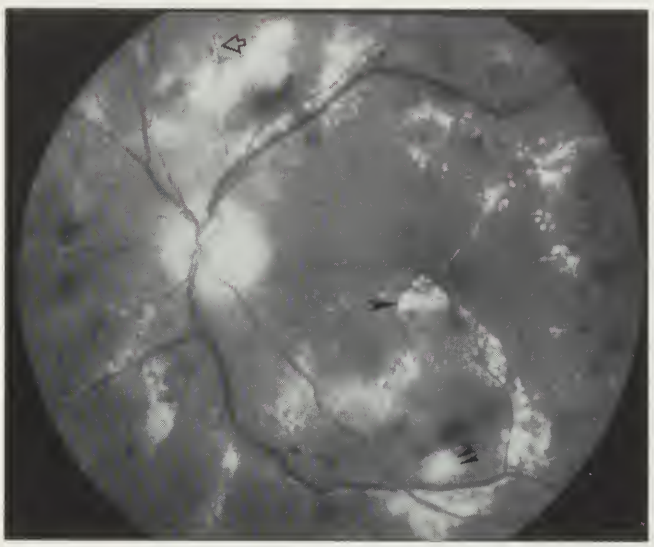

Figure 1. Severe background diabetic retinopathy. Exudates (single arrow), cotton-wool spots (double arrow), and perivascular sheathing (open arrow) indicate generalized decompensation of the retinal vessels.

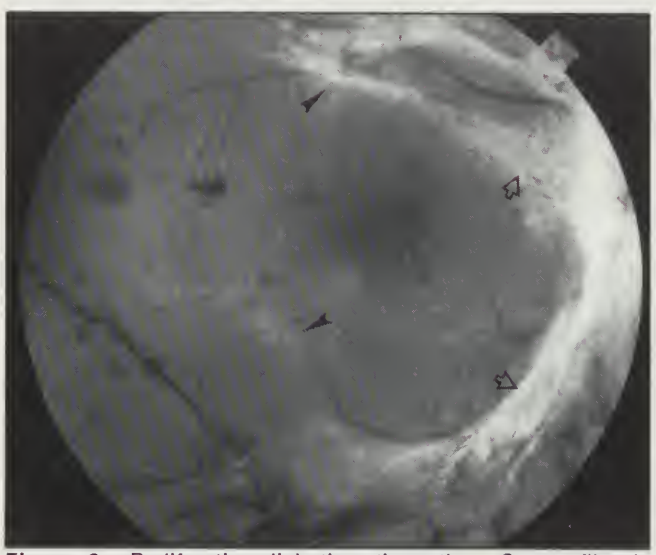

Figure 2. Proliferative diabetic retinopathy. Severe fibrotic neovascularization of the disc (open arrows) extends from the optic nerve along the vessel arcades to localized areas of traction detachment of the retina (solid arrows).

Management

The management of eyes with proliferative diabetic retinopathy has been studied carefully and standardized. The Diabetic Retinopathy Study was performed in the 1970s as a prospective, randomized, controlled trial that demonstrated the beneficial effect of panretinal photocoagulation with the argon laser for patients with various levels of proliferative retinopathy.[3] Statistics from that study provide specific guidelines to analyze and to manage the risk factors for catastrophic vision loss from proliferative diabetic retinopathy. Individual risk factors evaluated in the Diabetic Retinopathy Study and recognized to be associated with vision loss are:

Presence of new vessels
New vessels on the disc
New vessels moderate or severe
(size >1/2 disc diameter)
Vitreous hemorrhage

Figure 3 is a representation of the results of this study. The evidence overwhelmingly supports treatment of those cases where the disease has advanced to include three of these elements. Treatment of the peripheral retina with the laser results in regression of the new vessels with a subsequent reduction in the risk of a vitreous hemorrhage.

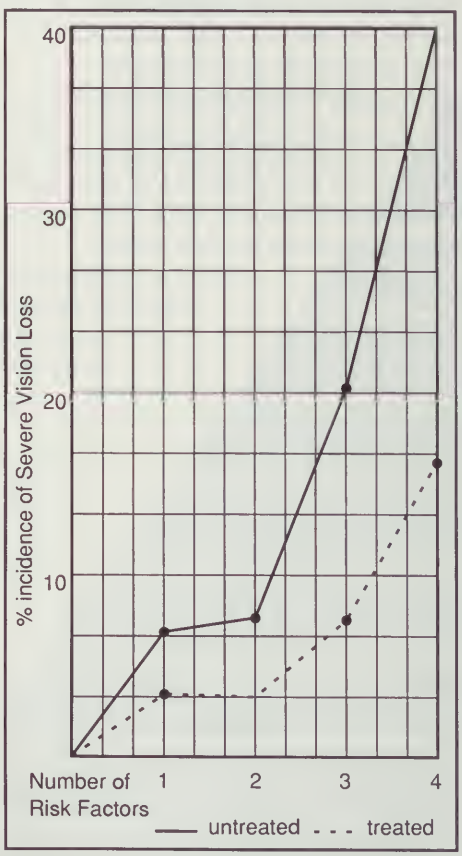

Figure 3. Two-year incidence of severe vision loss in argon laser treated vs. untreated eyes.

The risk factors previously described add up in analysis of an individual case to determine eligibility for treatment. For example, a patient with severe neovascularization of the disc automatically has three risk factors and needs photocoagulation therapy. The risk factor analysis for such an example would be: 1 (new vessels present) +1 (new vessels on the disc) +1 (new vessels severe-greater than 1/2 disc diameter in size) = 3 risk factors. According to Figure 3 there is just over a 20 percent risk of significant reduction in vision in an untreated eye with this many risk factors. After proper treatment with the laser, the risk can be reduced to less than 10 percent.

Patients who continue to suffer persistent vision loss from nonclearing vitreous hemorrhage or traction retinal detachment often benefit from surgery. With the development of vitrectomy techniques the vitreous, blood, and scar tissue can be surgically excised with a relatively good chance of stabilizing and dramatically improving the vision. The technique for pars plana vitrectomy is schematically illustrated in Figure 4.

Most insulin-dependent diabetic patients will develop some retinopathy in their lifetime. The prevalence of proliferative diabetic retinopathy increases with the duration of the disease. Of the ocular variables in patients with proliferative retinopathy, the presence of neovascularization of the disc is by far the most significant predictor of vision loss. Other variables such as hypertension, cigarette smoking, family history of diabetes, and pregnancy are frequently discussed in the epidemiology of retinopathy.

However, in considering which of our patients with proliferative changes is at highest risk, the single nonocular variable with the highest association with vision loss is the concurrent presence of renal disease as evidenced by protein in the urine.[4] High normal blood pressure (above the 90th percentile rank for age) and poor glucose control also have been associated with more rapid advancement of retinopathy.[5] None of these variables are as yet considered to have a causal relationship with diabetic retinopathy.

The effective management of background diabetic retinopathy has been the subject of numerous reports in the literature. The current guidelines for the management of background retinopathy were the subject of research published in 1985.[6] The specific findings of this randomized prospective study proved the hypothesis that focal photocoagulation reduces the extent of vision loss in properly selected patients with background diabetic retinopathy.

Useful data are available to help alert physicians to the likelihood of worsening of retinal disease. The Wisconsin Epidemiologic Study of Diabetic Retinopathy revealed that as many as 59 percent of patients normal at initial examination developed retin-opathy over a four-year period (see Table).[7,8] The same study showed that over 40 percent of patients with retinopathy experienced worsening of their disease during the four-year follow-up.

Selection of patients for laser treatment of background diabetic retinopathy has generated a great deal of scientific study. The presence of microaneurysms, exudate, focal hemorrhage, or even a documented advancement in retinopathy does not automatically indicate treatment is necessary. Individuals with background diabetic retinopathy are considered eligible for treatment only if they have what is termed "clinically significant macular edema." This specifically refers to the presence of thickening of the retina accompanying the retinal vascular decompensation described above. This edema may or may not be associated with exudate, but if edema is found within a disc diameter of the center of the macula the usefulness of treat-

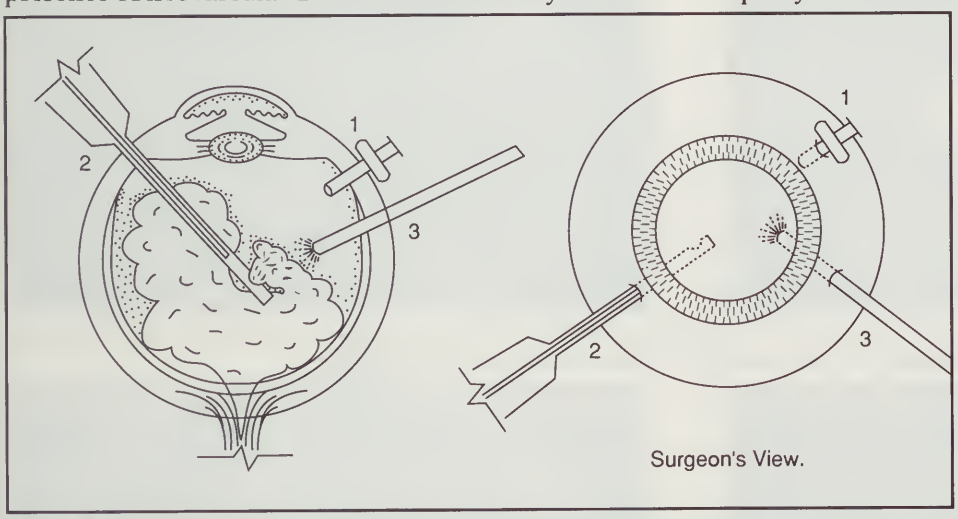

Figure 4. Pars plana vitrectomy is performed with three 1 millimeter incisions in the sclera. Port #1 allows saline to drip into the eye as the vitreous gel and hemorrhage are excised and evacuated by the guillotine action of the vitreous suction cutter in port #2. Illumination is provided through port #3.

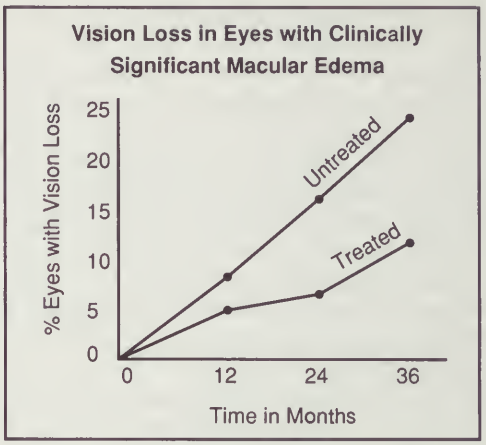
Table. Summary of Rate of Progression of Diabetic Retinopathy over a Four-year Period

	Diagnosis of Diabetes Made at Age Less Than 30 Years	Diagnosis of Diabetes Made at Age Greater Than 30 Years	
	Insulin Dependent	Not Insulin Dependent	Insulin User
Developed Retinopathy (normal at study entry)	59%	34%	47%
Retinopathy Worsened (initially had retinopathy)	41%	25%	34%

ment with the argon laser has been proved.

The Early Treatment Diabetic Retinopathy Study (ETDRS) evaluated focal treatment of microaneurysms and other leaking sites with the argon laser.[6] It was determined that eyes with clinically significant macular edema that were treated with the laser benefited by preserving vision longer than the untreated eyes used as controls. Figure 5 summarizes data showing untreated eyes with macular edema will lose vision more rapidly and to a greater extent than eyes treated with the laser. The data prove that properly performed photocoagulation treatment reduces the edema, delays the progress of retinopathy, and preserves vision independent of the visual acuity at the time therapy is initiated.

An example of the manner in which an eye with background diabetic retinopathy is assessed will help clarify these points. Figures 6 and 7 demonstrate an eye of a 59-year-old patient known to have diabetes for



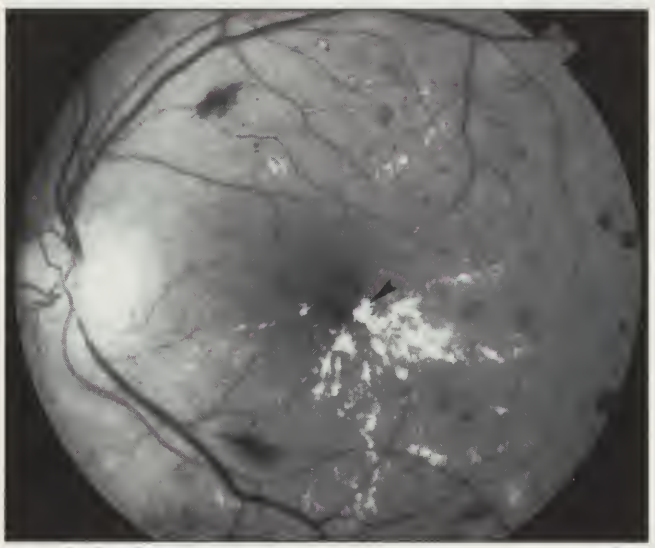


Figure 5. A summary of the results of the Early Treatment Diabetic Retinopathy Study for the treatment of background diabetic retinopathy.

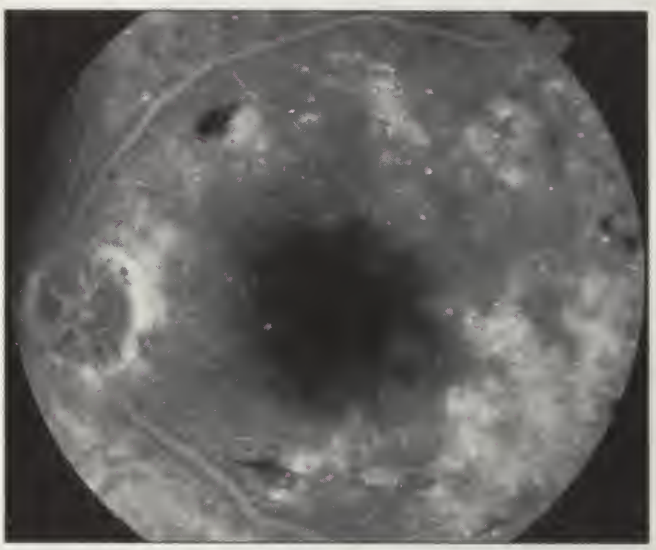

Figure 6a (left) and 6b (right). The preinjection photograph (left) shows extensive exudate (arrow) bordering on the fovea. The angiogram (right) shows focal hyperfluorescence from the dot-like microaneurysms and the resulting diffuse leakage.

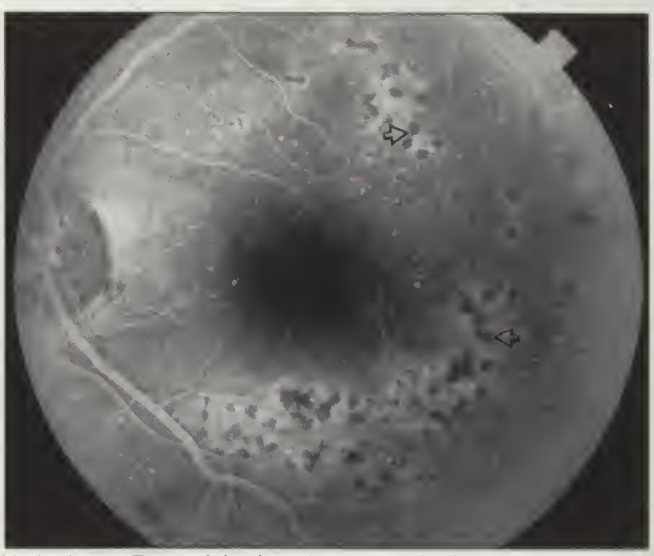

Figure 7a (left) and 7b (right). The same eye 3 months after treatment with the laser. The preinjection photograph (left) shows the exudate is remarkably less in comparison to Figure 6. The angiogram (right) shows the photocoagulation scars (arrows).

only four months. In addition to the leakage seen on the angiogram, the patient was found on examination to have clinically significant macular edema with vision reduced to 20/50. The eye was treated with the argon laser, and at the time of the three-month follow-up the edema was gone and the eye saw 20/30.

Summary

Every patient with diabetes is at risk for the development of macular edema or neovascularization and needs to be screened properly. Even if there is no ocular history or complaint, there may be significant retinopathy. The physician's knowledge of the factors placing eyes at risk as well as regular, careful evaluations and management of the development of significant changes constitutes the best way to retard the progressive loss of vision associated with diabetic retinopathy.

To avoid loss of vision, all patients with diabetes should have a complete retinal evaluation at least once a year starting at the time the disease is diagnosed.

HISTORY TAKING

Taking the history of an illness contributes more to proper diagnosis than the physical examination or laboratory testing. It is perhaps the most important tool of the internist. Chest discomfort that is centrally located, recurrent and made worse with activity is the earliest sign of an impending heart attack. To combat the number one killer of the adult population, it is important that we extend this history taking beyond the hospital and the medical profession and involve the community as well.

By changing our behavior from denial and delay to recognition and response, we can save our own life or the life of someone near us. Heart attack does not have to kill.

Learn how to act when it counts. A free speaker's bureau is available in Maryland and surrounding states. Call **(301) 368-3217,** or write to Dr. Raymond D. Bahr, St. Agnes Hospital, 900 Caton Avenue, Baltimore, MD 21229.

St Agnes Hospital

Advances in the Electrodiagnosis of Nerve Injury

Ira Wexler PhD, MD

Dr. Wexler is Chief of EMG Laboratory, J.L. Kernan Hospital, Baltimore.

Needle electrode nerve conduction recording is a powerful complement to the traditional techniques of EMG sampling of muscle and surface motor conduction measurements.

Electromyography (EMG) of muscle and motor nerve velocity measurements (NCM) have long been the methods most commonly used to assess nerve and muscle function in patients. Both techniques have shortcomings, and over the past decade newer, more accurate recording techniques have been developed for directly measuring conduction.

Electromyography

In EMG studies, long concentric electrodes are inserted into muscles to study their electrical discharge characteristics. Not only is this uncomfortable, but also the diagnostic information from such studies can be disappointingly small. In lumbosacral disc disease, for example, in the absence of focal neurological signs such as muscular weakness, atrophy, or asymmetrical deep tendon jerks the EMG can be expected to be positive in only about half the cases.[1,2] This low yield in part is the consequence of reinnervation of denervated muscle fibers by sprouts from adjacent uninjured motor nerve fibers. Denervation activity in the nerve root's myotome therefore dies out with time, and the EMG may revert to normal in muscles served by the previously injured nerve.[2]

Motor Conduction Measurements

In NCM, a critical measurement is the time it takes for a nerve action potential to travel to a muscle from two widely separated points of stimulation along the nerve. The time of conduction between these two points is then divided into the segment's length to give motor velocity. Since such calculations measure conduction exclusively over motor nerves (and only over the largest motor fibers) and since in a diseased nerve some motor fibers may continue to conduct normally while many fail to conduct at all, one may find normal or close to normal conduction velocities in nerves that nonetheless have suffered an appreciable amount of axon injury or demyelination.[3]

Near-nerve Needle Electrode Conduction Measurements

Because many painful syndromes seen in clinical medicine in-

volve damaged sensory nerve fibers, accurate measurement of conduction in sensory or mixed motor-sensory nerves is important. It has been traditional to measure conduction in sensory nerves by using surface electrodes taped to the skin. In carpal tunnel syndrome, for example, the antidromic sensory potential is measured by a pair of ring electrodes around the index finger while the median nerve is stimulated at the wrist.

Such surface measurements tend to miss the temporal dispersion and small peaks in the action potential that arise when conduction in some of the nerve's fibers fall below normal. When near-nerve needle electrode recording is used, however, such changes are detectable.[4,5] This technique requires that the skin overlying the nerve first be sterilized. Sterile, monopolar teflon-insulated stainless steel electrodes are then inserted percutaneously down to the immediate vicinity of the nerve. The two electrodes, one active and the other indifferent, remain fixed in this location while electrical stimulation of the nerve proximal or distal to this recording site is done. Because of the very low amplitude of the nerve action potentials (about 10 to 20 microvolts) and unavoidable electrical noise from adjacent muscle, several hundred sequential stimulations of the nerve have to be done while computer-assisted online filtering of the data is carried out.

Figure 1 shows the benefit of using needle electrodes to measure the peroneal nerve potential in a patient with diabetic neuropathy. The surface recording of the potential, made at the same site as the needle electrodes, shows a low amplitude, prolonged potential whose velocity falls within the lower limit of normal for this patient's age. The needle recorded potential, in contrast, shows not only low amplitude but also the multiple subpeaks characteristic of a nerve undergoing axonal degeneration and demyelination.

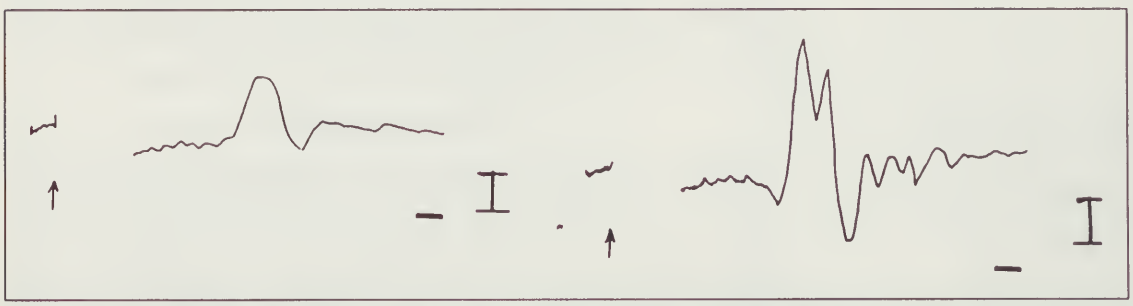

Figure 1. Surface (left) and needle electrode (right) recordings from the same site over the superficial peroneal nerve. Nerve damage characterized by the appearance of multiple subpeaks in the action potential is seen only in the needle electrode recording. Calibration = 1 msec, 2 microV.

Needle Electrode SEPs

Needle-electrode recording techniques also can be applied to the study of cervical or lumbosacral nerve root disease. In these anatomic regions, longer (25 mm, cervical; 37 mm, lumbar) needle electrodes are inserted between adjacent vertebrae and recordings are made of the electrode spinal evoked potentials (SEP) elicited by median or ulnar nerve stimulation in the upper extremities, or sciatic, tibial or peroneal nerve stimulation in the lower. In "normal" individuals, the SEP thus evoked look like the smooth action potentials obtained in peripheral nerve recordings; and like those recordings, SEP will show temporal dispersion with the appearance of subpeaks when axon injury and demyelination has occurred.

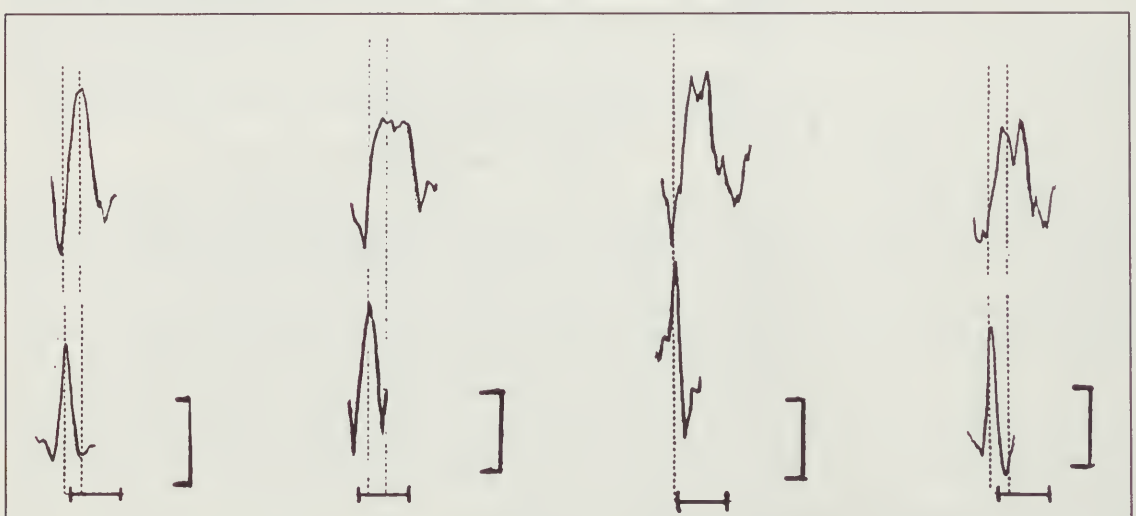

Figure 2. Cervical (upper tracings) and brachial plexus SEPs (lower tracings) recorded with needle electrodes. The left pair is from a normal individual, the next three pairs are from patients with cervical root disease. Slowing of conduction over compressed nerve roots gives rise to blunted, prolonged, and multipeaked SEPs on the affected side. Calibration = 5 msec, 1 microV.

Figure 2 shows SEP recordings from the C-6 vertebral interspace in a normal patient and in three patients with confirmed cervical root disease. Slowed conduction over the nerve roots of the latter is indicated by the widened appearance of the SEP, with multiple inflections at its peak.

In Figure 3, recordings from the T-12-L-1 interspace in three

patients with lumbosacral nerve root compression are shown. On the affected side, as a consequence of slowed conduction and axonal degeneration of some nerve root fibers, SEPs exhibit low amplitude with a fragmented, irregular appearance.

Summary

Needle electrode nerve conduction recording is a powerful complement to the traditional techniques of EMG sampling of muscle and surface motor conduction measurements. It enables the electromyographer to assess much more accurately subtle changes in peripheral nerve and nerve root conduction that previously could have gone undetected.

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. Choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package designed and developed by the Computer Services Department at the Medical and Chirurgical Faculty of Maryland. Physicians were consulted at every stage of the applications development to insure an easy-to-use and well-designed system. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500-form billing, appointment scheduling, and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management offers:

- ☐ Appointment scheduler
- ☐ Aging
- ☐ Day sheet
- ☐ Menu driven
- ☐ On-line help manual
- ☐ Maintains patient demographics
- ☐ Insurance billing (1500 form)
- ☐ Walk-out superbill
- ☐ End-of-month bill
- ☐ Statistical reports
- ☐ Accounting reports
- ☐ Unlimited technical support
- ☐ Unlimited software upgrades
- ☐ Unlimited office staff training
- ☐ Automatic back-up and restore
- ☐ Separate ICD-9 and CPT code databases
- ☐ Multiple diagnosis and procedure transactions
- ☐ Password protection to sensitive areas
- ☐ No annual fee for Med Chi members
- ☐ Clinical demographics

Functional and Cosmetic Surgery of Nose and Ear Deformities in Children and Adolescents

N. Edward Nachlas MD, Ira D. Papel MD, and Albert Steiner MD

Dr. Nachlas is Asst. Prof., Dept. of Otolaryngology - Head and Neck Surgery, The Johns Hopkins Medical Institutions; Clinical Asst. Prof., University of Maryland School of Medicine; and Chief, Dept. of Otolaryngology - Head and Neck Surgery, Baltimore County General Hospital. Dr. Papel is Asst. Prof.; Director, Div. of Facial Plastic and Reconstrutive Surgery, Dept. of Otolaryngology - Head and Neck Surgery, The Johns Hopkins Medical Institutions. Dr. Steiner is Clinical Asst. Prof. of Otolaryngology, University of Maryland School of Medicine, and Emeritus Chief of the Dept. of Otolaryngology, Baltimore County General Hospital and Maryland General Hospital.

Because congenital and traumatic disorders of the nose and ear in children and adolescents may be the result of many different factors, each patient must be dealt with on an individual basis.

Whenever possible, corrective surgery of the nose should be carried out at an early stage of the pathologic process. Single-stage septorhinoplasty, as contrasted with staged surgical procedures such as separate septoplasty and rhinoplasty, is recommended as the procedure of choice.

The anatomy, embryology, and common deformities of the auricle are examined, with emphasis on prominent ear deformities. Surgery for this type of deformity is usually recommended at age five to six years.

Nose Deformities

The presence of nasal deformity and functional abnormality may be caused by many factors, including trauma, congenital aberration, infection, drug abuse, or neoplasm. Developmental anomalies may arise from embryologic changes or disturbances beginning early in fetal life, for example, the hare-lip-cleft palate nasal deformity (Figure 1). Other deformities may occur during early fetal life due to drug exposure, nutritional deficiencies, or other intrauterine trauma. Intrauterine nasal trauma may occur from the third or fourth month of gestation, at which time the nasal capsule is well formed, until term. Injuries to the nose in utero, during birth, or in early infancy may escape immediate attention, yet may be manifested with significant nasal deformity and dysfunction in later life.

One common deformity of the nose seen in the neonatal period is subluxaton of the nasal septum during delivery. These injuries are more frequent in primiparae than in multiparae, and particularly so in long, difficult labors. Most commonly there is flattening and lateral displacement of the nose associated with

contralateral displacement of the base of the septum from its vomerine groove (Figure 2). This is not a fracture but a dislocation. If uncorrected, as the septum grows it will deviate at its caudal end and luxate from the maxillary crest, causing functional obstruction. This deformity is recognizable in many adults, with the ususal history of no known nasal trauma. What appears to be a minor injury in the neonatal period may have significant clinical importance in future years. When recognized early, this type of birth injury should be corrected with a simple closed reduction, often performed at bedside with a small amount of local anesthetic.

Figure 1. Cleft palate nasal deformity

Figure 2. Birth trauma, dislocated septum

Nasal trauma is one of the most common injuries known to mankind. Over 70 percent of all nasal injuries involve the cartilaginous elements of the nasal structure. This includes the cartilagenous septum and the paired upper and lower lateral cartilages that define the shape and function of the lower two-thirds of the nose. Deformities or fractures of the cartilagenous elements are not revealed by standard nasal radiographs. Physical examination is frequently much more revealing and accurate than radiographic examination.

Infants and children are subjected to many nasal injuries during normal play and athletics. During their "growing up" the ossification centers within the nose are very active and sensitive to trauma. Even a clinically minor incident to these areas may excite these centers in a dynamic way and alter the growth potential, leading to future deformity. Injury early in life may lead to acceleration, deceleration, or arrest of bony nasal growth centers. An example may be the adult with a nose of infantile size and characteristics. Asymmetry of the nasal bones without history of known trauma is another frequent occurence.

Infection of the nasal septum at an early age may cause complete destruction of the cartilagenous septum leading to subsequent maldevelopment presenting as an infantile nose or saddle nose with functional collapse and airway obstruction. The presence of a septal hematoma or abcess must be treated immediately to prevent these sequelae in children (Figure 3).

Figure 3. Septal hematoma

In recent years the use of cocaine in the adolescent population has produced a significant number of septal perforations.[1] Treatment of these perforations is extremely difficult with respect to substance abuse therapy and surgical reconstruction. Reconstruction cannot begin until the substance abuse has ceased for several months to a year. The long-term sequelae of unrepaired cocain-induced septal perforations are similar to loss of the septum secondary to untreated abcess or hematoma.

Nasal and septal deformities secondary to trauma may be minor and asymptomatic or severe and completely obstructing. There is a subgroup of patients who seem to tolerate severe deformities with airway obstruction, feeling "it doesn't bother me." This is often a case of long-term accommodation to symptoms rather than normal nasal function. Long-term severe nasal obstruction has been linked to definite physiological damage such as pulmonary hypertension and sleep apnea syndromes.[2]

Surgical correction of marked septal and nasal deformities in children and adolescents may prevent the sequelae of severe nasal airway obstruction and disfigurement. The surgery may be performed at any age as long as there is respect for the key growth centers of the nose and the approach is conservative. Combined septal and corrective rhinoplastic surgery in the case of deviation of the septum and bony pyramid is usually indicated because the mobilized pyramid heals in the direction of the septal line. In most cases of twisted noses, the bony pyramid will not heal straight unless the underlying septal injuries are corrected at the same time. Usually there is no need for a staged approach to the twisted nose. At one time it was common to undergo a septoplasty and then return for a secondary rhinoplasty with osteotomies at a later date. This is no longer the standard of care. The combined techniques of septoplasty and rhinoplasty are intermingled in the treatment of the complex nasal injury and should be combined for the best results.

Past guidelines for aesthetic rhinoplasty have dictated that male patients should be 18 years old, and females 16 before undergoing corrective rhinoplasty. Recent evidence has shown that if conservative techniques are used, surgery for adolescents with severe cosmetic deformities can be performed without unwanted sequelae.[3] The psychologic benefits afforded during or soon after puberty seem to outweigh the risks of disturbing growth centers. It should be emphasized that early rhinoplasty is recommended only in adolescents with severe cosmetic deformities that may have significant effect on psychological development.

Plastic Surgery of the Auricle

Congenital deformities of the pinna range from simple preauricular pits to total absence (anotia). The first evidence of the otic structure is seen in the three-week embryo and appears as a placode. This neuroectoderm will become the otic depression and then the otocyst, eventually forming the cochlear structures.

The auricle originates from first and second branchial arches around the first branchial groove, first seen in the fifth week of development. Each arch develops three hillocks that later fuse. After the eighth embryonic week, the proportion of second arch mesenchyme increases in relation to the first arch and makes a greater contribution to the total pinna. The second arch contributes the helix, antihelix, scapha, antitragus, and lobule. The first arch contributes the anterior crus of the helix and the tragus. Thus, the most common deformities of the auricle result from second arch aberrations. A physician should recognize that auricular deformities, especially microtia, may be associated with abnormalities of other organ systems developing in the same embryologic period.

The most common abnormalities of the pinna referred to a facial plastic surgeon involve protruding ears. This may be secondary to unfurling of the antihelical fold, excess depth of the conchal bowl, or a combination of features. The superior crus of the antihelix, which forms the superior border of the triangular fossa, may be notably absent. The term protruding ear is distinct from the description "lop ear," which implies an auricle hanging limply from its attachment.[4] Most protruding ears maintain normal size and position with respect to facial analysis (Figure 4.)

Constricted ears, or cup ears, have as chief characteristics lidding of the helix, deficiency of the scapha, and/or triangular fossa. This leads to an ear that may be smaller than normal, protruding, and possibly low

Figure 4. Prominent ears

Figure 5. Constricted ear

Figure 6. Microtia

set. The typical description of a constricted ear is that it appears to be closed by a drawstring[5] (Figure 5).

Microtia deformities commonly involve abnormalities in position, size, configuration, and canal atresia. Fifty percent are associated with other congenital anomolies. Thirty percent are associated with recognizable syndromes such as Treacher-Collins and Goldenhar's. The only recognizable structure in a microtic auricle may be the lobule. (Figure 6.) Reconstruction of microtia deformities usually starts at age six with a three- or four-stage procedure involving costal cartilage grafts, tragus reconstruction, and pinna elevation. Over the past 20 years surgical techniques for this deformity have become very sophisticated and reliable. The surgeon must work very carefully with an otologist so that canal atresia and middle ear deformities can be addressed at the appropriate time. Anotia is an extreme and rare deformity with no recognizable auricular structures on the affected side. Atresia of the canal and middle ear deformities are expected.

Most children presenting for correction of protruding ears are motivated to proceed with elective surgery. They may have been the subject of intense teasing at school by their peers, and psychological stress may be apparent.[6] In general, surgery is recommended before the child begins elementary school (age six or seven years). Increasingly, adults with prominent ear deformities are presenting for elective correction.

Although surgical correction of anotia and microtia require a complex, multistaged procedure, correction of prominent ears is readily achieved by a single-stage operation. Techniques dealing with protruding ears have been described since the mid-nineteenth century, when surgeons treated this deformity by excision of skin and/or auricular cartilage in an attempt to reduce the size of the ear.[7] During the twentieth century, hundreds of techniques have been described with varied degrees of sophistication to enable the facial plastic surgeon to produce a natural appearing ear. These techniques are based on the observation by Luckett[8] in 1910 that the primary deformity in protruding ears is the absence of the antihelical fold.

Today there are two dominant methods of correcting the prominent ear deformity. Within each method exists numerous variations. One method involves the careful placement of mattress sutures in the auricular cartilage to create an antihelical fold and reduce projection, as first described by Mustarde[9] in 1963. The second group of procedures is based on the principle of reforming the antihelix by molding the cartilage, either with a diamond burr or dermabrader, until a natural appearing fold is constructed from cut cartilage edges. These cartilage-splitting techniques offer the advantage of being independent of suture placement for long-term results. The cartilage-splitting otoplasty that involves this sculpturing technique was described in 1970 by Nachlas et al.[10] and is derived from an earlier technique reported by Cloutier[11] (Figure 7a and b).

Whichever technique is used, the goal of all otoplasty procedures is to produce a natural, smooth-appearing ear with normal contours and angles. This is usually accomplished in an outpatient setting with minimal morbidity.

Potential complications of elective otoplasty include hematoma and perichondritis, which can lead to cartilage loss and severe auricular deformity. A persistent protruding ear can occur due to inadaquate cartilage preparation and/or skin excision. If the cauda helicis is not excised or repositioned, the inferior helix and lobule may show persistent protrusion in relation to the repositioned auricle.

Summary

Congenital and traumatic disorders of the nose and ear in children and adolescents must be dealt with on an individual basis. The indications for surgical correction must be guided by functional, psychologic, and aesthetic considerations.

Immediate Reconstruction after Mastectomy: Team Approach

Elmer Hoffman MD, FACS; Stanley A. Klatsky MD, FACS; and Alan S. Davis MD, FACS

From the Department of Surgery, Baltimore County General Hospital, where Dr. Hoffman is Chief of Surgery, Dr. Klatsky is Chief of the Division of Plastic Surgery, and Dr, Davis is Attending Surgeon. Dr, Hoffman is Assistant Professor of Surgery and Dr. Klatsky is Assistant Professor of Plastic Surgery, The Johns Hopkins University School of Medicine.

A review of 198 cases of breast reconstruction done at the time of mastectomy for carcinoma of the breast shows an extremely low morbidity. The technique of using a tissue-expander prosthesis enables immediate breast reconstruction without any fear of impairing prognosis, of spreading disease, or of impeding adjuvant therapy.

A surgeon doing breast cancer surgery must offer every woman hope of restoration of her body as well as a positive prognosis. The surgeon also must take the initiative in recommending breast reconstruction, not waiting for the patient to broach the subject.

Mastectomy produces marked psychological changes regardless of the woman's age. These changes are shown in Table 1.[1-18]

Immediate breast reconstruction following mastectomy for cancer gives the opportunity to alter or block these psychological changes with the results shown in Table 2.[1-18]

Immediate breast reconstruction should be offered to every woman facing a mastectomy as part of the surgeon's first discussion of the diagnosis and proposed treatment. If this is done, the surgeon will see an amazing change in the patient's attitude from negative to positive.

The surgeon must be committed to seeing the woman achieve restoration of body form. He must believe there is no need for such statements as: "Getting used to the loss," "Wait to see if there is spread," "Be happy you are alive, forget reconstruction," "Reconstruction may interfere with follow up and discovery of recurrences," or "If we wait for later reconstruction, the patient will not look for perfection."

Team Effort

The use of immediate breast reconstruction at the time of mastectomy for cancer must be a team effort undertaken by the breast ablative surgeon and the plastic reconstructive surgeon.

This team effort requires complete dedication to the principles of helping the patient overcome her psychological difficulties, to the ablation of malignancy, and to immediate reconstruction of form. This requires the meshing of operating schedules, office hours, and office visits for two very busy operating surgeons. There must be cooperation by the Operating Room Nursing Supervisor and the Operating Room Scheduling Office. This con-

cept also mandates complete and separate consultative patient discussions by both the ablative and the plastic reconstructive surgeon. These discussions include the diagnosis, the modalities of treatment available, with advantages and disadvantages of each, and the availability of immediate breast reconstruction.

During these discussions, the patient may experience a psychological turnaround from negative to positive, once reconstruction is mentioned. Often the idea of anatomical destruction and not the idea of malignancy produces the psychological devastation of the patient. It is important to refocus the patient's emphasis on deformity and death toward resumption of living with an anatomically complete body.

With the fall from favor of the true Halstedian radical mastectomy and the increasing use of the modified mastectomy, the opportunity to perform immediate submuscular implantation of prostheses presented itself. The team concept was developed and refined at the Baltimore County General Hospital approximately five years ago with the placement of permanent prostheses in selected cases. With the advent of the Rhadovan Tissue Expander Device[21] its logical application to breast implantations followed.

We embarked upon a team concept program of immediate breast reconstruction after modified mastectomy for cancer using the Rhadovan Tissue Expander placed submuscularly.[7-10] A strict protocol and team approach was adopted. The mastectomy surgery was done by the ablative surgeon and the plastic reconstructive surgery by the plastic surgeon. None of the surgery was done by Assistants. Strict rules of separate prepping, draping, gowning, gloving, and separate instrumentation were put in place for the two parts of the surgery. The same team concept principles were used for the bilateral cases when we enlarged the scope of the series.

   Mood
   Body image perception
   Sexual attractiveness
2. Rapid return to normal life
3. Reduces fear of recurrence
4. Eliminates guilt feelings caused by others

Surgical Procedure

At surgery, the plastic surgeon and ablative surgeon outline the skin incision. The breast surgeon then performs the mastectomy, taking care to keep the fascia of the serratus anterior intact. In the modified radical mastectomy portion, the axillary contents are meticulously dissected to preserve nerves and vessels to the pectoralis major and minor muscles as well as to the latissimus dorsi and serratus anterior muscles. Following the removal of the specimen, the plastic surgeon then implants the tissue expander beneath the pectoralis muscles. The wound is then closed by the plastic surgeon over the appropriate drainage system. The plastic and breast surgeons examine the patient on each postoperative day with careful attention to the skin flaps. The team approach is paramount throughout the postoperative follow-up.

The expander is inflated by injecting saline through the skin into the valve, beginning in approximately three to four weeks and then at weekly intervals. After approximately six expansions, surgery is scheduled. At this operation, the expander is removed and the permanent prosthesis is inserted.

Questions

A number of concerns and questions are raised by patients and physicians. These are listed in Table 3 and must be answered by the ablative surgeon.

There is no experimental or clinical evidence that the natural history of carcinoma of the breast is altered.[1,2,4,5,19-26]

New tissue planes are not opened at the time of mastectomy. Under the team concept, there is a complete skin repreparation, change of drapes, gowns, gloves, and instruments, and, in addition, a change of surgeons. Submuscular placement has not had any effect on the development of local recurrence (superficial location) or regional recurrence (axillary or supraclavicular areas).

There is no compromise in the performance of mas-

Table 3. Questions

1. Is the natural history of the disease altered by placement of the prosthesis?
2. Are new tissue planes opened at the time of mastectomy?
3. Is performance of mastectomy comprimised when planning immediate reconstruction?
4. Does reconstruction interfere with detection of local recurrence?
5. Does the presence of the prosthesis interfere with treatment of the local recurrence?
6. Does reconstruction impede or interfere with administration of chemotherapy or irradiation?
7. Does chemotherapy or radiotherapy harm implants?
8. Does the implant alter or impair immune response?
9. Does the implant induce malignancy?
10. Does delay between diagnosis and mastectomy-reconstruction alter disease prognosis?
11. Does delay in replacement of the expander with a permanent prosthesis produce any ill effects?

tectomy when there is a planned immediate reconstructive procedure. With our team concept, we have a completely integrated yet separated procedure. The ablative surgeon performs the mastectomy with no concern about plastic reconstruction. The plastic surgeon enters the operation only after the completion of the mastectomy. The ablative surgeon should not do the implant procedure because he might be influenced in his performance of the mastectomy.

Immediate breast reconstruction does not mask recurrences. The incidence of isolated local recurrence is less than 7 percent.[27-33] Gilliland [29,34] found that a mean of 6.2 years elapsed before chest wall recurrence was seen in Stage I patients, a mean of 4.3 years for Stage II disease, and a mean of 2.1 years for Stage III disease. If Stage I and II patients are treated after the recurrence, the length of survival averages 7.2 years and 6.0 years for Stage I and II, respectively. Another study[20] found a 1.5 percent recurrence of disease in the chest wall in patients of all stages 2 years after mastectomy. Bedwinek[27] found a 6.4 percent evidence of chest wall recurrence in 3 to 12 years after mastectomy in patients of all stages. When local recurrences occur, they are isolated in the chest wall, primarily in the scar area from 61[29] to 82[27] percent of the time.

All methods of treatment (surgery, radiation, or chemotherapy) may be used with an implant in position.[1,2,4,5,11,35] Since these recurrences are, for the most part, in the scar and appear within two years or longer of mastectomy, the reconstruction would long since have been completed. Evidence indicates that local and distal metastases become manifest at the same time interval after mastectomy regardless of treatment modality. If anything, the submuscular implant, by its very location, will push things forward and make detection of the recurrence easier.

The presence of a prosthesis does not interfere with the treatment of local recurrence. The local recurrence is superficial to the submuscular pocket and may be excised easily if that is to be the method of therapy. The literature indicates that chemotherapy produces no increase in infections, loss of prostheses, or wound separations.[1-3,5,6,17,20] If the treatment is radiotherapy, the prosthesis can tolerate up to 10,000 rads without any effect on it. The absorption of radiation by the implant is almost the same as by water.[1-3,5,6]

Breast reconstruction does not impede or interfere with the administration of chemotherapy or radiation. Saline expander injections can be completed during the intervals between courses of chemotherapy. The chemotherapy can start as soon as three weeks after surgery, if the wound is healed.[1-3,5,6,17,20] The permanent implant can be placed during a free interval between chemotherapy courses. The presence of the implant should not interfere with any radiation therapy, which can begin as early as three weeks after surgery if wound healing has occurred.[6,20]

The only difficulty we found is the opinion of some medical-oncological consultants who want to work independently of us and want their year of chemotherapy to pass before advising reconstruction. This is a direct result of some of the ancient adages quoted earlier in the paper.

There is no evidence, in the literature, that the presence of a breast implant alters or impairs immune response.[5,6,19,20]

There is no evidence of the development of carcinoma or sarcoma, by the implant in animals higher in the scale than a rat.[5,20]

The literature does not indicate any evidence of any effect on prognosis or on the disease-free interval by a delay of as long as six weeks between the time of an incisional or excisional biopsy and the definitive mastectomy.

It has been our experience that a delay in the replacement of the expander by a permanent prosthesis does not produce any ill effects. We had several patients who developed intercurrent illnesses, causing delay in the placement of a permanent prosthesis. Our longest delay was 1.5 years between the time of mastectomy and placement of the expander and the replacement with a permanent prosthesis. This was secondary to intercurrent cardiac and renal obliterative vascular disease and subsequent surgery prior to replacement of the expander.

Criteria for Immediate Reconstruction

We will perform the procedure if the tumor is no larger than 5 cm and if there are no restrictions in terms of location of quadrant of the tumor. There must be a confirmed permanent section report of the diagnosis of carcinoma. Palpable axillary nodes are not a deterrent since there is a 20 to 30 percent false-negative and false-positive result when one compares clinical and pathological findings. Distant disease should not preclude the use of an implant since it will not interfere with adjuvant therapy.

Advantages and Disadvantages of Immediate Reconstruction

Tables 4 and 5 list the authors' view on the advantages and disadvantages of immediate breast reconstruction.

Morbidity of Immediate Reconstruction

In advocating immediate breast reconstruction at the time of mastectomy, one must be aware of the possible complications that ensue upon this procedure. Morbidity in our series of 198 breast reconstructions is shown in Table 6. Three cases were classified as capsular contraction. These were demonstrated by examination of the patient and not by symptomatology on the part of the patient. These were easily released, and the patients had no further difficulty.

Six deflations occurred, all of them in the temporary expander phase. When these were replaced, it was seen that the plastic connection to the valve had

separated on two occasions. On three occasions, the seam between the plastic extension coming off the expander had leaked. On one occasion a needle puncture had occurred (one of our earliest cases in this series).

In two cases, there was a wound separation with exposure of the implant. This was not associated with any marginal slough or infection.

In four cases a marginal slough occurred with subsequent exposure of the implant. These were removed, the sloughed margin excised, and expander reinserted. There was no subsequent difficulty in the further course of these patients. In two cases, either the prosthesis or the expander was removed. In one case, the prosthesis was removed following the development of a huge hematoma over the chest wall as a result of a fall causing chest wall trauma and a fractured humerus.

In one case, the patient continued to complain of pain over the prosthesis. Whent it was removed, the patient's pain disappeared. In no other cases was pain a factor in prosthetic results.

There were six cases of infection or a 3 percent incidence. The most significant factor that was turned up in the review of these cases was that five of the six had had some type of respiratory tract infection within six weeks prior to the discovery of an infection around the implant. Two patients had had actual pneumonia. One patient had a tracheitis. Two patients had suffered a moderately severe upper respiratory infection or cold. If this fact is supported by other investigators, we might consider requiring the patient to take prophylactic antibiotics at development of any upper respiratory tract infection. Cultures taken of the abscess cavity at the time of surgery revealed gram positive cocci in four of the five cases in which culture was obtained.

When bilateral mastectomy was carried out, it was done with a synchronous two-team approach. The estimated time added to the two-team synchronous bilateral procedure over the unilateral was approximately 30 to 45 minutes. The length of stay in the hospital was approximately four days for both the unilateral and bilateral mastectomy-reconstruction cases. This is essentially the same as if the patient had had mastectomy without reconstruction. There were six delayed transfusions in the bilateral mastectomy-reconstruction cases. There were none in the unilateral cases.

Table 4. Advantages of Immediate Reconstruction

1. Psychological support of patient
2. Does not adversely affect natural course of the disease
3. Does not adversely affect adjuvant chemotherapy or radiotherapy
4. Does not affect detection of chest wall recurrence
5. Excellent technical results
6. Skin more compliant and larger in area when no previous scarring and wound contraction
7. Less expense
8. No increase in morbidity, actually less
9. No increase in tumor recurrences
10. Age is no limitation
11. Can do bilateral procedure and avoid the problem of bilateral breast carcinoma
12. Systemic problems should not play a role in selection of implant procedure. If able to have a mastectomy, patient is able to have an implant.
13. Realization that the woman can have reconstruction will encourage earlier diagnosis and treatment.

Table 5. Disadvantages of Immediate Reconstruction

1. Longer anesthetic
2. Possible increase in blood loss
3. Requires consistency and flexibility of team work of ablative and reconstructive surgeons
4. Must be careful in aspiration of a seroma if one should develop postoperatively

Table 6. Morbidity: Series of 126 Cases with 198 Mastectomies

		Number	Percent
Capsular contraction		3	1.5
Deflation (all in temporary expander phase)		6	3
Separation at site of valve	2		
Separation at expander seam	3		
Needle puncture	1		
Wound separation with implant exposure		2	1
Marginal slough with implant exposure		4	2
Removal		2	1
Fracture humerus w/chest wall hematoma			
Pain over prosthesis			
Infection		6	3
Respiratory infection within prior 6 weeks	5		
Pneumonia	2		
Tracheitis	1		
URI	2		
		23	11.5

Conclusion

With the technique using tissue expander prostheses, immediate breast reconstruction can be offered to every woman without fear of impairing prognosis, of spreading the disease, or of impeding adjuvant therapy, and with the promise of body form restoration along with preservation of the woman's psychological balance.

The new option for initial antihypertensive therapy

New Rx information

"Initiate therapy with 180 mg of sustained-release verapamil HCl, Calan SR...."

–From Dosage and Administration section of complete prescribing information for Calan SR.*

NEW 180 mg CALAN SR

- Instead of a diuretic or an ACE inhibitor.
- For treatment of mild to moderate hypertension.

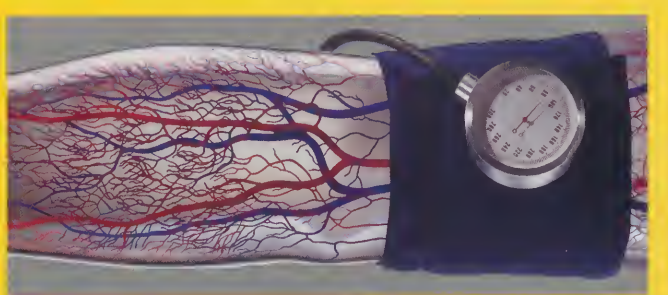
Highly effective...

- Effective regardless of age[1-6†] or race.[2]
- In six clinical studies, allowing for dosage titration up to 480 mg per day, more than 80% of 4,000 adult patients on Calan SR as a single-agent antihypertensive achieved goal blood pressure.[1-6]

Well tolerated...

- Total side-effect incidence with Calan SR 180 mg was not significantly different from that of placebo.[7]
- Constipation, the most commonly reported side effect of Calan SR, is easily managed in most patients.

*Lower initial doses of 120 mg a day may be warranted in patients who have an increased response to verapamil (eg, the elderly or those of small stature).



†For adult hypertensives only.

Please see references and a brief summary of prescribing information on adjoining page.

Calan® SR
verapamil HCl 180mg
SUSTAINED-RELEASE CAPLETS

YOUR 80% SOLUTION
In mild to moderate hypertension

*Lower initial doses of 120 mg a day may be warranted in patients who have an increased response to verapamil (eg, the elderly or those of small stature).

BRIEF SUMMARY

Contraindications: Severe LV dysfunction (see *Warnings*), hypotension (systolic pressure < 90 mm Hg) or cardiogenic shock, sick sinus syndrome (if no pacemaker is present), 2nd- or 3rd-degree AV block (if no pacemaker is present), atrial flutter/fibrillation with an accessory bypass tract (eg, WPW or LGL syndromes), hypersensitivity to verapamil.

Warnings: Verapamil should be avoided in patients with severe LV dysfunction (eg, ejection fraction < 30%) or moderate to severe symptoms of cardiac failure and in patients with any degree of ventricular dysfunction if they are receiving a beta-blocker. Control milder heart failure with optimum digitalization and/or diuretics before Calan SR is used. Verapamil may occasionally produce hypotension. Elevations of liver enzymes have been reported. Several cases have been demonstrated to be produced by verapamil. Periodic monitoring of liver function in patients on verapamil is prudent. Some patients with paroxysmal and/or chronic atrial flutter/fibrillation and an accessory AV pathway (eg, WPW or LGL syndromes) have developed an increased antegrade conduction across the accessory pathway bypassing the AV node, producing a very rapid ventricular response or ventricular fibrillation after receiving I.V. verapamil (or digitalis). Because of this risk, oral verapamil is contraindicated in such patients. AV block may occur (2nd- and 3rd-degree, 0.8%). Development of marked 1st-degree block or progression to 2nd- or 3rd-degree block requires reduction in dosage or, rarely, discontinuation and institution of appropriate therapy. Sinus bradycardia, 2nd-degree AV block, sinus arrest, pulmonary edema and/or severe hypotension were seen in some critically ill patients with hypertrophic cardiomyopathy who were treated with verapamil.

Precautions: Verapamil should be given cautiously to patients with impaired hepatic function (in severe dysfunction use about 30% of the normal dose) or impaired renal function, and patients should be monitored for abnormal prolongation of the PR interval or other signs of overdosage. Verapamil may decrease neuromuscular transmission in patients with Duchenne's muscular dystrophy and may prolong recovery from the neuromuscular blocking agent vecuronium. It may be necessary to decrease verapamil dosage in patients with attenuated neuromuscular transmission. Combined therapy with beta-adrenergic blockers and verapamil may result in additive negative effects on heart rate, atrioventricular conduction and/or cardiac contractility; there have been reports of excessive bradycardia and AV block, including complete heart block. The risks of such combined therapy may outweigh the benefits. The combination should be used only with caution and close monitoring. Decreased metoprolol clearance may occur with combined use. Chronic verapamil treatment can increase serum digoxin levels by 50% to 75% during the first week of therapy, which can result in digitalis toxicity. In patients with hepatic cirrhosis, verapamil may reduce total body clearance and extrarenal clearance of digitoxin. The digoxin dose should be reduced when verapamil is given, and the patient carefully monitored. Verapamil will usually have an additive effect in patients receiving blood-pressure-lowering agents. Disopyramide should not be given within 48 hours before or 24 hours after verapamil administration. Concomitant use of flecainide and verapamil may have additive effects on myocardial contractility, AV conduction, and repolarization. Combined verapamil and quinidine therapy in patients with hypertrophic cardiomyopathy should be avoided, since significant hypotension may result. Concomitant use of lithium and verapamil may result in a lowering of serum lithium levels or increased sensitivity to lithium. Patients receiving both drugs must be monitored carefully. Verapamil may increase carbamazepine concentrations during combined use. Rifampin may reduce verapamil bioavailability. Phenobarbital may increase verapamil clearance. Verapamil may increase serum levels of cyclosporin. Concomitant use of inhalation anesthetics and calcium antagonists needs careful titration to avoid excessive cardiovascular depression. Verapamil may potentiate the activity of neuromuscular blocking agents (curare-like and depolarizing); dosage reduction may be required. Adequate animal carcinogenicity studies have not been performed. One study in rats did not suggest a tumorigenic potential, and verapamil was not mutagenic in the Ames test. Pregnancy Category C. There are no adequate and well-controlled studies in pregnant women. This drug should be used during pregnancy, labor, and delivery only if clearly needed. Verapamil is excreted in breast milk; therefore, nursing should be discontinued during verapamil use.

Adverse Reactions: Constipation (7.3%), dizziness (3.3%), nausea (2.7%), hypotension (2.5%), headache (2.2%), edema (1.9%), CHF, pulmonary edema (1.8%), fatigue (1.7%), dyspnea (1.4%), bradycardia: HR < 50/min (1.4%), AV block: total 1°,2°,3° (1.2%), 2° and 3° (0.8%), rash (1.2%), flushing (0.6%), elevated liver enzymes. The following reactions, reported in 1.0% or less of patients, occurred under conditions where a causal relationship is uncertain: angina pectoris, atrioventricular dissociation, chest pain, claudication, myocardial infarction, palpitations, purpura (vasculitis), syncope, diarrhea, dry mouth, gastrointestinal distress, gingival hyperplasia, ecchymosis or bruising, cerebrovascular accident, confusion, equilibrium disorders, insomnia, muscle cramps, paresthesia, psychotic symptoms, shakiness, somnolence, arthralgia and rash, exanthema, hair loss, hyperkeratosis, macules, sweating, urticaria, Stevens-Johnson syndrome, erythema multiforme, blurred vision, gynecomastia, increased urination, spotty menstruation, impotence. 12/21/89 • P90-W198V

Liposuction: Blood Loss and Autotransfusion

Mitchel A. Kanter MD and William R. Kanter MD

From the Department of Surgery, Division of Plastic Surgery, Baltimore County General Hospital.

Blood loss usually is not clinically significant during liposuction, but the need for transfusion increases with the amount of tissue removed. Autologous blood donations in preparation for significant blood loss are widely accepted by patients and physicians.

The plastic surgeon trained and experienced in liposuction is able to estimate the amount of tissue that must be removed to achieve the desired result. This is of clinical importance when the amount of resection results in significant amounts of fluid and third-space fluid loss. We review parameters we use to predict blood losses and guidelines for the use of autologous blood transfusions.

Liposuction has become a common procedure since it was first performed by Schruddle in 1964.[1] The usual indications for liposuction are isolated contour deformities in patients who are not generally obese. However, the indications are increasing and include treatment of wounds with bulky margins (that may result from mastectomy), flaps that require debulking as secondary procedures, lipomas, multiple familial angiolipomatosis, and gynecomastia.[2,3] Liposuction has been used to allow linear closure of the donor site of a skin flap that would otherwise have required a skin graft.[4] Other uses undoubtedly will appear as experience with the technique increases.

Blood loss usually is not clinically significant, although there is a potential for significant bleeding, and some patients have required transfusions. External losses can be estimated by the volume of aspirated material, which consists mostly of fat and 25 to 35 percent blood, although the percentage of blood is highly variable and ranges anywhere from 8 to 54 percent.[5-7] Hidden, or "internal," blood loss and fluid shifts within the tissue that was suctioned are more difficult to estimate.

Avoid transfusion if possible. A careful history usually will reveal a history or family history of bleeding disorders and indicates that more thorough evaluation should be performed. A bleeding time should be performed if a history of aspirin or nonsteroidal anti-inflammatory agent (for example, Motrin, Advil) use is elicited. The bleeding time should be below 7 minutes. Otherwise, elective surgery should be deferred until 10 to 14 days after discontinuation of the medication. A prothrombin time (PT), partial thromboplastin time (PTT), and platelet count also are useful screening tests.

During the liposuction procedure, blood loss is minimized by use of the blunt suction cannula, introduced by Illouz[8] in 1977, rather than sharp curettes. The surgeon should observe the aspirate and stop when the color turns from pink to red. Preoperative local infiltration with an epinephrine-containing solution in a 1:200,000 to 1:400,000 dilution may reduce blood loss.[9,10] Perioperative hydration is critical in maintaining fluid balance since patients usually come to the operating room in a fasted state for eight hours or more, and depending on the size of the cannula and area suctioned, "internal" fluid and/or blood loss will occur and further deplete the intravascular volume. Finally, well-fitted elastic garments may reduce interstitial swelling and the potential dead space in which fluid can accumulate.

The need for blood transfusion increases with the amount of tissue removed. If more than 1500 cc of aspirate are anticipated, we prepare to transfuse at least one unit of autologous blood and an additional unit for each liter of material removed (Table).

The rationale for preparing autologous blood as opposed to banked blood results primarily from the fear of transmitting viral illnesses. While screening programs have been very successful in reducing the incidence of hepatitis B, over 10 percent of patients who received multiple blood transfusions acquired non-A non-B hepatitis (hepatitis A is generally not transmitted by blood). A second virus transmitted by blood is cytomegalovirus (CMV), which usually causes clinical illness in immunodeficient hosts. Finally, the risk of transmission of the AIDS virus by blood is a real concern for everyone. While still not common among transfusion recipients, partly because of the very long incubation period measured in years, it is beginning to be reported with increasing frequency among patients who have received large amounts of blood products.[11]

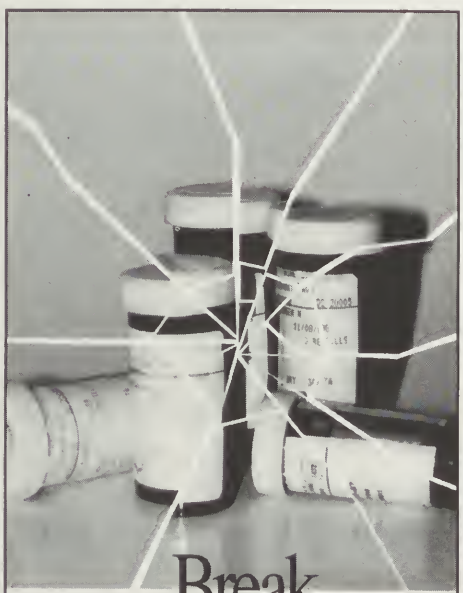
Because of these concerns, bloodbanks have devised protocols whereby individuals undergoing elective surgery may bank their own blood. Autologous blood transfusions are not new, and their use was described by Grant in 1921.[12] At present, blood is stored as whole blood with citrate-phosphate-dextrose and may be stored for up to 35 days in the refrigerator at 4°C. Longer periods of storage result in diminished red cell diphosphoglycerate (2,3 DPG), a compound required for normal oxygen delivery to the tissues. Loss of this substance causes an increased affinity of oxygen hemoglobin (shift to the left of the oxygen hemoglobin dissociation curve), and failure of the hemoglobin to release oxygen to the tissues. The amount of lactic acid, potassium, and ammonia also is increased with blood storage, although the amounts are not clinically significant except in patients with far advanced renal or hepatic disease. Platelets, clotting factor 5, and clotting factor 8 are lost in stored blood.

Autologous blood donations are accepted as long as the patient's hematocrit remains above 34 percent. Each unit of whole blood donated reduces the hematocrit an average of 1.5 percent, although this can be as high as 4 percentage points. Patients routinely are placed on oral iron supplements consisting of ferrous suffate 325 mg by mouth three times daily. Patients should be warned that the iron will turn the color of their stools dark.

Serial blood donations usually are not taken more frequently than once weekly, although five-day intervals between donations are acceptable. By the time of surgery, the hematocrit has almost completely returned to normal.[13] If necessary, a donation may be made up to three days prior to surgery. Thus, a patient may have as many as 6 or 7 units of autologous blood in the bloodbank, although this is rarely required. The hematocrit is routinely checked prior to each donation and blood will not be taken if the hematocrit falls below 34 percent.

The safety of autotransfusion has been documented,[13] and has gained widespread acceptance among patients and physicians in preparation for liposuction when significant blood loss is anticipated.

Table. Suction Lipectomy and Autotransfusion



Units of Blood Prepared for Autotransfusion[1]	Anticipated Volume of Tissue Removed	Estimated Blood Loss[2]	Typical Area of Body or Indication for Suction Lipectomy
0	Negligible	Negligible	Neck Lower face (jowls) Distal extremities Lipomas Debulking flaps performed for cancer or trauma
0	250-1500 cc	<500 cc	Upper abdomen Complete abdomen, moderate Hips Thighs Lumbar region Buttock Lymphedema
1	1500-2500 cc	500-800 cc	Abdomen, large Combined, 2 major ares
2	2500-3000 cc	1000 cc	Combined, 2 major areas, large ≤ 15% total body surface areas
3 or more	>3000 cc	>1000 cc	Combined, 3 major ares, large > 15% total body surface area

1. Guidelines only. Fluid and blood replacement modified according to individual patient's needs, hemodynamic parameters, urine output, unexpected losses, etc.
2. Based on rule of thumb of approximately 33 percent of material obtained composed of blood. Actual amount may vary between 10 and 50 percent. The surgeon should watch the aspirate during the entire procedure for signs of excess blood removed.

CHOICE

Medical Mutual Says They Offer It

Princeton Says They Offer It

And PIE Mutual Says They Offer It.

Of course they do. But depending upon *your* needs, the nature of *your* practice and all of those other intangibles that separate you from other physicians, don't you deserve the very *best* choice?

Of course you do. That's why it makes sense to deal with an Agent/Broker who puts *your* best interests first—someone who can place you in *any* of the three companies mentioned above.

If you are sincerely interested in making the best possible choice, don't you think the best possible place to start is by asking which Agent/Broker is best for you?

Nonparasitic Splenic Cysts

Elmer Hoffman MD, FACS and Yu-Wen Chang MD, FCAP

Dr. Hoffman is Chief of Surgery, Baltimore County General Hospital, and Assistant Professor of Surgery at The Johns Hopkins University School of Medicine. Dr. Chang is Associate Chief of Pathology, Baltimore County General Hospital.

Splenic cysts are rare: cysts changes occur less frequently in the spleen than in any other abdominal viscera.

In 1829 Andral[1] described the first splenic cyst at autopsy. The first successful removal of a splenic cyst was performed by Pean[2] in 1867. Kirby[3] in 1955 reported 188 cases of nonparasitic cysts of the spleen. By 1978 less than 600 cases of nonparasitic cysts were recorded in the world literature.[4]

Splenic cysts most frequently occur in patients 20 to 50 years old and occasionally in children.[5]

Etiology and Pathogenesis

Table 1 lists a classification of the etiology of splenic cysts. Trauma always has been suspected of playing a role in the formation of large hemorrhagic or serous types of splenic cysts. About 50 percent of the splenic cysts occurred within three years after trauma. However, a history of trauma cannot always be obtained.[5-8] This is understandable since most people will have sustained some type of injury to the left chest or upper abdomen sometime in their past.

If trauma is the etiologic agent[6] the sequence of events is injury, splenic laceration within the capsule, laceration of splenic vessels, hemorrhage, encapsulation of the hematoma, absorption of the blood, fibrous wall formation, and persistence of serous fluid within that wall.

Spontaneous intrasplenic hemorrhage also has been designated as a possible etiologic agent.

Splenic cysts occur more frequently in women than in men with a ratio of 3:2, and most frequently during childbearing age. Often there has been a menstrual irregularity reported in the cases of splenic cysts. The spleen becomes congested during menstruation and pregnancy. There is a report of a case of a marsupialized splenic cyst that continued to discharge blood at the time of each menstrual period.[9] In one series 70 percent of the cases of splenic cyst occurred during pregnancy, and 20 percent of these had a history of trauma.[10]

Splenic infarction with degeneration of the arteriolar blood supply to a portion of the spleen has been considered an etiologic

factor,[11] and there is both support and dispute for this theory.[6] Degeneration of the splenic tissue following closure of vessels from thrombosis, embolism, or endarteritis also has been incriminated as an etiologic agent.[9]

When splenomegaly occurs, the patient is more likely to have injury to the spleen if subjected to trauma. Splenomegaly may be due to other diseases of the spleen such as malaria, syphilis, tuberculosis, typhoid fever, paratyphoid fever, and mumps. Peritoneal infoldings with subsequent trauma (producing what has been known as infoliation cysts) have been reported as well as congenital cellular rests in the spleen with subsequent growth, with or without trauma.[6,12-15]

Calcification of a splenic cyst may occur regardless of the etiologic agent and has been reported in parasitic cysts.[6,16,17]

Classification and Pathology

A modified Fowler's system of classification of splenic cysts [13-15, 18-19] is shown in Table 2.

According to Akerman,[20] approximately 75 percent of the nonparasitic cysts of the spleen are secondary false cysts or pseudocysts. The cyst wall is made of dense fibrous tissue, often hyalinized and calcified, but no epithelial lining is present. The cyst usually is filled with bloody material or yellowish necrotic debris.

About 10 percent of the nonparasitic cysts of the spleen are epidermoid cysts lined by stratified squamous epithelium without any skin appendages or hair follicles. If skin appendages or hair follicles are present, the cyst is a dermoid cyst.

Endothelium-lined splenic cysts actually are cystic vascular or lymphatic tumors (hemangiomas and lymphangiomas). Hemangiomas may be either capillary or cavernous type, histologically the same tumors as seen in other parts of the body. The criterion of a lymphangioma lies in the presence of budding cells in the lymph sinuses.

Simple cysts are lined by a single layer of cuboidal mesothelial cells. The inner wall often has tree root-like trabeculations. The cyst wall shows varying degrees of fibrosis.

It is very important to examine the cyst wall carefully. Because large portions of the inner surface of primary splenic cysts may be devoid of an epithelial lining as a result of degeneration, many sections often are needed to classify the cysts properly.

In another classification of splenic cysts by their location,[21] it was found that 26 percent were located in the lower pole, 18 percent on the convex surface of the spleen, 18 percent on the concave surface of the spleen, 14 percent at the hilus, 12 percent at the anterior border of the spleen, 9 percent at the upper pole and 3 percent on the posterior border.

  1. Epithelial cysts
     - Epidermoid
     - Dermoid
  2. Endothelial or mesothelial cysts
     - Hemangiomas
     - Lymphangiomas
     - Simple cysts
- Secondary false cysts or pseudocysts (cysts without cellular linings)
  1. Traumatic (blood and serous types)
  2. Degenerative (liquefaction)
  3. Inflammation
     - Acute necrosis in infection
     - Chronic tuberculosis

Symptomatology

Splenic cysts may be asymptomatic and may be found accidentally at the time of a routine physical examination, an exploratory laparotomy or abdominal operation for other disorders, or during gastrointestinal x-ray studies (Table 3).[1-3,6,8,22-24]

The simple presence of a mass in the abdominal

Table 3. Symptomatology

Vomiting	Fullness
Constipation	Flatulence
Diarrhea	Abdominal pain

  3. Genitourinary symptoms

Dysuria	Albuminuria

  4. Temperature elevation and chills
  5. Weight loss

cavity may produce some symptoms. There may be a feeling of heaviness in the left upper quadrant and left hypochondrium. Pain may accompany the presence of this mass and may vary from something as simple as an uncomfortable pressure to severe pain located in the abdomen, chest, left shoulder, left hypochondrium, epigastrium, mid-back, peri-umbilical region, left costovertebral angle, and left chest. The pain has been reported to be worse following large meals.

Some symptoms may be due to pressure of the mass upon the surrounding structures. This may produce dyspnea, cough, chest pain, vague digestive disturbances, nausea, vomiting, fullness, constipation, flatulence, abdominal pain, and/or diarrhea.

Weight loss and temperature elevation also have been reported in association with a splenic cyst.

There are changes reported in conjunction with radiologic studies that help in making the diagnosis of a splenic cyst. A plain film of the abdomen may show a soft tissue mass or calcification. The psoas shadow may be obliterated. Fluoroscopy of the diaphragm may reveal elevation of the left side, limitation of excursion, and movement of the soft tissue mass with respiration. There may be pleural effusion and pneumonitis on the chest x-ray. Displacement of the left kidney downward may occur and be visualized on an intravenous pyelogram. A GI series may reveal that the stomach is displaced downward and to the right. On barium enema, the splenic flexure is displaced downward. An ultrasound examination of the upper abdomen may reveal the cyst of the spleen. A liver/spleen scan will show an abnormality of the spleen. A CAT scan of the abdomen will show the cystic mass in the spleen and marked detail of the surrounding structures.

Table 4 lists diseases that have been most frequently confused with splenic cysts. [2, 3, 6, 8, 13-15, 25, 26]

Table 4. Differential Diagnosis

Pancreatic cyst	Omental cyst
Mesenteric cyst	Cyst of left lobe of liver
Ovarian cyst	Cyst of left kidney
Splenomegaly due to other causes	Echinococcus cyst
Tumor of left kidney	Aneurysm of splenic artery
Retroperitoneal tumor	

Treatment

Marsupialization was recommended in early reports as a method of handling splenic cysts. However, as modern surgery improved and adjuvant measures became available, splenectomy was considered the method of choice. In recent years with the description of the entity of post-splenectomy sepsis, it has been advisable, where possible, to perform a partial splenectomy with removal of the splenic cyst. The occurrence of post-splenectomy sepsis most often is seen in younger patients where the immunologic development has not yet matured. It is rare to encounter post-splenectomy sepsis following splenectomy in adults.

Many articles have been written on the technique of splenectomy and partial splenectomy, the types of incisions used, and the advisability of drainage of the splenic bed and postoperative anticoagulation. In the opinion of the author (E.H.) the splenic bed should be drained and prophylactic anticoagulant therapy should be instituted postoperatively to prevent the possible fatal complication of thrombosis of the splenic vein and portal vein.

Cases

Tables 5a, and 5b summarize pertinent clinical data. A palpable mass in the left upper quadrant (LUQ) was present in 50 percent of the cases. A history of trauma was present in four of the six cases. The CAT scan would seem to be the prime test in diagnosing this entity. All six patients were treated with splenectomy, and all recovered uneventfully. All except two patients (Cases 1 and 5) received pneumococcal vaccine.

Four of the present series were pseudocysts, one was an epidermoid cyst, and one was classified as a simple cyst. Further description is found under the Pathology section.

Figures 1 and 2 are examples of the cases reported.

Only one case, Case 4, had a post operative platelet count of more than 1,000,000. That case had a peak platelet count of 1,194,000 on postoperative day 21. Anticoagulant therapy was utilized.

Summary

The ultrasound modality, the Scintiscan with tech-

netium, and the CAT scan may make the diagnosis and may pinpoint the location of the splenic cyst.

Physical examination may reveal no abnormalities. In some cases a mass may be palpable in the LUQ. Bulging of the left lower intercostal spaces has been reported. The diaphragm may exhibit impaired motion and elevation. Percussion and auscultation of the chest may reveal secondary pulmonary findings.

Case Report: Adenocarcinoma of the Anal Canal

Howard K. Berg MD

From the Department of Surgery, Colorectal Section, Baltimore County General Hospital.

While survival rates for squamous cell carcinoma of the anal canal have improved over the years, survival rates for the more rare adenocarcinoma remain dismal.

Carcinomas of the anal canal are uncommon lesions that represent about 2 to 6 percent of large bowel carcinomas.[1,2] While various histologic types have been described, squamous cell carcinoma is by far the most frequently encountered variety. A more rare histologic type is an adenocarcinoma, which arises from the anal canal ducts. While survival rates for squamous cell carcinoma have improved over the years, secondary to combined chemotherapy and radiation therapy,[3-5] survival rates for adenocarcinoma of the anal canal remain dismal.

Report Case

An 80-year-old white female presented with a three-month history of perianal pain, burning, and bright red blood per rectum. She denied crampy abdominal pain, constipation, diarrhea, or change in bowel habits but did note a decrease in the caliber of her stool. Her medical history was unremarkable. Physical examination also was unremarkable except for the rectal exam, which showed a posterior quadrant mass at the anal verge with a 4 cm erythematous, eczematous butterfly lesion (Figures 1 and 2). The mass was hard to palpation, with mild tenderness.

The patient was taken to the operating room for evaluation under anesthesia and for biopsy of the lesion. Pathology was reported to be an infiltrating moderately and poorly differentiated adenocarcinoma. The patient subsequently underwent a CT scan of the abdomen, pelvis, and chest, as well as colonoscopy. There was no evidence of metastatic or synchronous disease.

The patient underwent an abdominal perineal resection with wide perineal dissection including removal of the posterior vaginal wall and partial bilateral vulvectomy. Pathology showed a poorly differentiated adenocarcinoma with involvement of anal mucosa and submucosa as well as Paget's disease of the perianal tissue (Figures 3 and 4). The wound was allowed to heal by secondary intention.

Three months postoperatively the patient was found to have a 2 x 2 cm palpable right groin node. The patient underwent excisional biopsy of the node, which showed poorly differentiated

adenocarcinoma consistent with the primary tumor. The patient subsequently underwent radiation therapy, consisting of 5500 cGy, to the perineum and groin. She is presently nine months postoperative with no evidence of disease.

Discussion

The surgical anal canal as defined by the American Joint Committee for Cancer Staging (AJC) extends from the anorectal ring to the anal verge, at the level of the intersphincteric groove.[3] This is typically about 4 cm in length in women and 4.5 cm in length in men. The anal canal is divided into three epithelial zones consisting of the lower squamous zone from the intersphincteric groove to the dentate line, the anal transitional zone (which extends upward from the dentate line about 1 cm), and the colorectal zone up to the anorectal ring.[6]

Histologically the squamous zone is lined by a nonkeratinizing squamous epithelium with short or no papillae. Glands are never present. At the level of the anal verge the squamous zone gradually merges with the perianal skin, where keratinizing epithelium with apocrine glands and hair follicles can be seen. The anal transitional zone may have a small rim of mature squamous epithelium and is typically lined by stratified cuboidal to columnar epithelium, similar to the rectal mucosa above it.

At the level of the dentate line, anal intramuscular glands open directly into the crypts of Morgagni. These mucus-secreting glands are branched tubular structures lined by transitional epithelium near their orifices and at their depths are lined by low columnar or cuboidal epithelium.[7]

Because of the different histologic patterns seen in the anal canal, a variety of tumors can arise. Morson and Sobin[8] however, have grouped these so that 80 percent of all primary anal canal carcinomas are considered epidermoid, while the remaining 20 percent include adenocarcinoma, undifferentiated carcinoma, and melanoma.

Adenocarcinomas are presumed to arise from the lining of the anal intermuscular glands. Nielson and Koch[2] note that anal duct adenocarcinomas can be divided according to their localization into (1) anal or (2) perianal, perirectal, or ischiorectal. They believe adenocarcinomas in this area probably always originate from the anal intramuscular glands. The exact origin, however, may be difficult to substantiate secondary to destruction of the gland by the malignant process.[9] Other possible sources of adenocarcinoma in this region include those arising in perianal fistulas[10] or from the apocrine glands in the perianal area.[11]

Figure 1. Showing perianal infiltration.

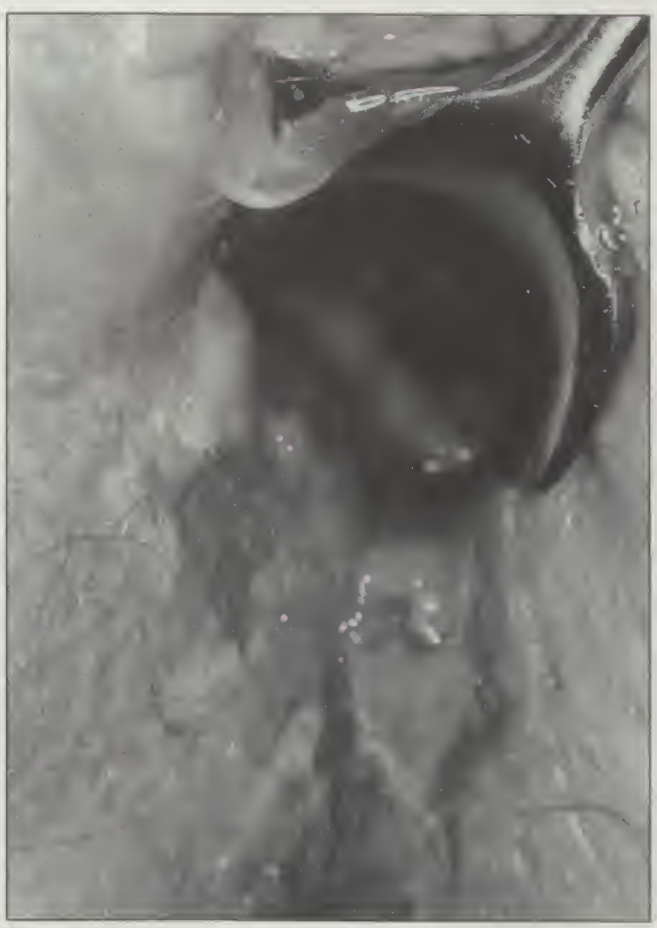

Figure 2. Showing tumor at the anal verge.

When symptoms are present, many times patients equate them with benign problems that may be present at the same time, and therefore, in more than 60 percent of patients the disease is discovered late. Bleeding, pain, palpable mass, and pruritus are the most common symptoms.[1,5,12] Spread of anal canal carcinoma is chiefly through local extension and lymphatic drainage to the pelvis and groin.

Literature Review

While there are only a few series of cases of anal canal adenocarcinoma found in the literature, all seem to indicate a poor survival rate. Cabrera et al.[13] over a 43-year period collected a series of eight cases. They had no reported five-year survivors, although two patients were still alive at two-and-a-half and three years following abdominal perineal resection. Merlini and Eckert[12] had two of six patients survive five years, whereas in a more recent series, Jensen et al.[14] had only one patient out of twenty one survive five years. This lone survivor was diagnosed accidentally during microscopic evaluation of an excised hemorrhoid.

Treatment for adenocarcinoma of the anal canal should consist of radical surgery including an abdominal perineal resection and wide excision of involved perianal tissue.[9,11] Data regarding lymph node management are not clear from the literature. With the patient presented here, a 2 cm enlarged palpable lymph node was found three months following her initial surgery. She underwent an excisional biopsy with subsequent radiation therapy to both groins and has no evidence of recurrence at this time. In light of the overall dismal outcome of this disease and weighing morbidity brought about by groin dissection, excisional biopsy of enlarged nodes followed by radiation to the groin may be the most reasonable method of treatment. As in squamous cell carcinoma of the anal canal, there is no evidence that prophylactic groin dissection will have a favorable effect on the five-year survival.

Summary

A review of the literature shows adenocarcinoma of the anal canal to have a poor outcome. Radical surgery is the treatment of choice for this disease.

Results of Cholecystectomy in a Community General Hospital

Elmer Hoffman MD, FACS; Alan S. Davis MD, FACS; and Cary Glasser MD, FACS

From Baltimore County General Hospital Department of Surgery, where Dr. Hoffman is Chief, Dr. Davis is an Associate, and Dr. Glasser is an Active Attending. Dr. Hoffman is also an Assistant Professor, Department of Surgery, The Johns Hopkins University School of Medicine.

Biliary tract surgery can be done in a nonresidency hospital with extremely low morbidity rates, an absence of wound infections, an absence of wound dehiscences, and absence of mortality.

Cholecystectomy is one of the most common operations performed in the United States.[1-3] Some studies quote a mortality rate for cholecystectomy ranging from 0.3 to 3 percent,[3-7] and a morbidity rate ranging from 21.4[3] to 33.6 percent.[7] This represents a sharp decline in recent years from the 6.6 percent mortality rate in 1932[6] and 1.8 percent mortality rate in 1952.[4]

One frequently hears that biliary surgery is better done in a teaching institution. Undertaken to confirm a perception that the above is not correct, our study of cholecystectomy performed was done in a 240-bed community hospital without a surgical residency training program. Patient coverage is maintained on a 24-hour basis by medical and surgical physicians employed by the hospital. The physicians providing floor coverage are a separate group from the coverage in the Intensive Care/Progressive Care Units, Emergency Room, and Operating Room, each of which has its own separate physician group.

Assisting in the Operating Room is provided by a separate group of surgeons, 85 percent of whom are board certified in surgery and 5 percent of whom are board eligible. Second Assistants in the Operating Room are Surgical PAs or Surgical Technicians.

The Study

The period covered by this study extended from March 1, 1986 through December 31, 1986, and a total of 132 cholecystectomy cases was reviewed from the standpoint of age distribution, sex distribution, admitting diagnosis, presenting symptomatology, operative procedures performed, anesthesia administration, use of operative cholangiography, use of preoperative and postoperative antibiotics, pathology findings, bacteriology findings, use of drains, morbidity, mortality, and length of hospitalization.

The cases were distributed among 27 surgeons.

Table 1 shows the age distribution in the present series of patients. The sex distribution was 3 to 1 in favor of females. Symptomatology in this series is listed in Table 2.

The operative procedures performed on the present series of patients are listed in Table 3. Seventy-four percent of the cases had anesthesia administered by Nurse Anesthetist. The Anesthesia Department has eight Anesthesiologists and four nurse anesthetists. An Anesthesiologist is assigned as an Operating Room supervisor on every case administered by a Nurse Anesthetist.

Intraoperative cholangiography was performed in 53 percent of the cases of this series. Preoperative and postoperative antibiotic usage is described in Table 4.

Findings

The pathology findings are listed in Table 5.

Bacteriological results of the cultures taken in this series showed a 15 percent incidence of positive cultures. There was a 27 percent incidence of positive cultures in the cases of acute cholecystitis and a 9 percent incidence in the nonacute cases. The organisms in the acute cases included *alpha streptococcus*, *E. coli*, *Salmonella*, and *Klebsiella*. The organisms in the nonacute cases included *streptococcus fecalis*, *E. coli*, *Staphylococcus*, and *Klebsiella*.

In 79 percent of the cases, drains of either the Penrose rubber tissue type or suction type were used. In 21 percent of the cases, no drains were used.

Morbidity and Mortality

The morbidity of this type of surgery in our series of cases is listed in Table 6. There was an extremely low morbidity rate, absence of wound dehiscences, and absence of mortality. The literature quotes a morbidity rate ranging from 1 to 9.4 percent.[8-17] In our series, there was an occurrence of 23 instances (1.7 percent) of non-life-threatening complications (Table 6). The literature quotes mortality rates ranging from 0.6 to 2.6 percent.[8-17] There were no deaths in the present series.

The average length-of-stay for cholecystectomy patients below the age of 65 years was 5.9 days. The average for patients 65 years old and over was 8.8 days. If common duct exploration was added to the cholecystectomy, the corresponding lengths-of-stay were 9 days (below 65) and 10.2 days (65 and above).

Conclusions

It is possible for biliary tract surgery to be carried out in a nonresidency community general hospital with

Table 1. Age Distribution

Age Group	Number	Percent
10-19	1	0.7
20-29	17	12.9
30-39	30	22.7
40-49	24	18.2
50-59	19	14.4
60-69	24	18.2
70-79	12	9.1
80-89	5	3.8

Table 2. Presenting Symptomatology

Death	0

excellent results. The absence of serious morbidity and the absence of mortality are demonstrated in our study.

There was a 27 percent incidence of positive bile cultures in acute cholecystitis cases. There was a 9 percent incidence of positive bile cultures in cases of nonacute biliary surgery.

The present series of cases was evaluated from the standpoint of age, sex, admitting diagnoses, presenting symptomatology, type of surgery, anesthesia coverage, the performance of operative cholangiography, the use of antibiotics, the findings by the pathologist, and the use of drains.

Our series demonstrated an extremely low morbidity rate with an absence of wound infections, an absence of wound dehiscences, and an absence of mortality.

You Should Be Taking Care Of Your Patients . . . Not Your Billing!

Management Systems, Inc. Will Speed Up Your Billing And "Cure" Ailing Accounts

MSI implements new methods, designs new programs, and enhances existing systems to help physicians improve financial controls.

- Our system provides the doctor with fast turnaround time.
- Medicare & Blue Shield claim dispositions occur on a weekly basis.
- Statements reach patients shortly after services have been rendered and your expert care is still fresh in their minds.
- Insurance rejections are easily resolved.
- Self-pay statements are generated as required with clear explanations.

Management Systems, Inc.'s "Computer-Side Manner" Is The Best

MSI can provide the level of participation each customer requires with a full range of services, using a batch system, an online system, or a comprehensive turnkey system.

- Insurance forms are completed and submitted, and self-pay statements are mailed.
- Receipts, deposits, and patient inquiries are handled by MSI.
- We manage your accounts receivable

Our turnkey systems are comprehensive in handling all a physician's billing needs.

MSI can help physicians structure their office procedures. Our years of experience allow us to serve you in an efficient and individualized manner.

Call MSI to find out how we can help you

MERCY MEDICAL CENTER
BALTIMORE, MARYLAND

Announces a Program in Phacoemulsification

Course Director: Leeds E. Katzen, M.D., F.A.C.S.
Chief, Department of Ophthalmology
Coordinator: Kathleen Molyneaux, R.N.

This intensive two-day program is designed for the surgeon who actively intends to begin performing these techniques and may or may not have had prior problems. The objective of this program is to provide the participant with the full range of knowledge and support necessary to be successful with the most current techniques of Phacoemulsification.

The Program Will Include:

- Indications and contraindications for Phacoemulsification.
- Intensive lectures with audio visual aids, by full-time and guest faculty.
- Preoperative preparation and postoperative care.
- Routine practical instruction in laboratory on surgical technique and use of the Phaco-Emulsifier.
- Capsularhexis and Hydrodisection.
- One-handed and two-handed techniques taught.
- Management of complications.
- Concentrated time for question and answers and discussion with the full time and guest faculty.

Course Dates:
October 12-13, 1990
November 16-17, 1990
1991 Dates to be Announced

Guest Faculty
To Be Announced
Tuition: $495.00
10 Hours Category 1
CME Credit

For Additional Information, contact:
Kathleen Molyneaux, R.N. • Mercy Medical Center
301 St. Paul Place • Baltimore, MD 21202 • (301) 783-5878

As an organization accredited for continuing medical education, the Mercy Hospital Center designates this continuing medical activity as meeting the criteria for 10 credit hours in Category 1 of the Physician's Recognition Award fof the American Medical Association.

$1,000,000 Celebration

We are pleased to announce that **MED PAY** has funded $1 million in annualized physicians billing this year.

This means no more insurance or collecting hassles for our new clients including:

- Psychiatrist
- Orthopedic Surgeon
- Physical Therapist
- Podiatrist
- Internist

We would be glad to schedule a free consultation to discuss how this timely billing and cash flow (Get paid today for patients seen yesterday and convert your present receivables to cash) program can be of benefit.

Receive Payment Today for Patients Seen Yesterday

Diabetes and Impotence

Doctor, I am 77 years old and have had insulin dependent diabetes for 39 years. My sex life was normal until I had a suprapubic prostatectomy about ten years ago. Since the operation I have been unable to have a penile erection. Did damage occur at the time of surgery or is this condition due to my diabetes? What can I do to improve the situation?

It is interesting that you lived for 10 years with this problem without discussing it with a physician even though you were being seen for diabetes four to six times each year. Men are hesitant to discuss sexual impotence with other people, even their physicians. A physician may make light of the situation attributing the problem to age, diabetes, psychic reasons, or a surgical procedure without evaluating the problem.

Approximately half of middle-aged diabetic males are impotent due to neurologic and vascular complications of the disease. If sexual dysfunction is of sufficient concern for the patient to mention, he and his sex partner need study and treatment. In the last fifteen years testing procedures have been perfected to the point where the cause of the impotence can be determined accurately. Testing procedures are:

1. Good history and physical examination
2. Nocturnal penile tumescence test
3. Hormonal studies
4. Psychological testing
5. Neurological evaluation
6. Vascular evaluation

If impotence is due to a correctable condition such as psychogenic, hormonal deficiency , or aortic-iliac obstruction (Leriche's syndrome), therapy is available and should be considered. If impotence is due to nerve or vascular damage from a surgical procedure or problems such as diabetes, the option of some of the following forms of therapy should be offered:

1. Better control of the diabetes
2. Discontinuance or change of unnecessary medications
3. Discontinuance of use of alcohol
4. Psychogenic support and sex education
5. Surgical options
   - Semirigid prosthetic devices
   - Hydroflex prosthesis
   - Arterial revascularization and venous ligation
6. Oral and transcutaneous pharmacologic agents
7. Suction devices

In your situation the surgical procedure could have caused impotence since you determined that it immediately followed surgery, but further discussion elicited that the quality of your erection gradually had been decreasing prior to the surgery. It is possible your impotence could have been multifactorial, including aging.

As long as the patient has libido and a willing sex partner, a complete sexual impotence evaluation and appropriate treatment are justified.

Diabetic men on chronic dialysis programs and men in the ninth decade of life have sought therapy for impotence and have been gratified with the pleasure derived after the use of some of the therapeutic methods suggested.

DeWITT E. DeLAWTER MD
Editor

Physician Placement Services

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201-5585
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

In Memoriam
Hugh Judge Jewett MD

A professor emeritus of urology at The Johns Hopkins Medical Institutions and an international authority on bladder cancer, Hugh Judge Jewett MD died May 6, 1990. He was a 40-year member of Med Chi. "Dr. Jewett's remarkable career spanned more than 50 years at Johns Hopkins," said Richard S. Ross MD, dean of The Johns Hopkins University School of Medicine. "He was a devoted member of our staff whose achievements in urology were an integral part of American medicine."

Dr. Jewett's medical career at Hopkins began in 1935 and advanced steadily through academic levels from instructor of urology to full professor and, finally, emeritus in 1969. His professional activities continued unabated throughout his 84th year.

Dr. Jewett dedicated his career to advancing the surgical specialty of urology, focusing on the two most common cancers of the genitourinary system: prostate cancer in men and bladder cancer in men and women. He was editor of the *Journal of Urology* for 11 years, a position in which he contributed much to urologic literature. He founded the *Urological Survey* in 1951 and served as its editor for 37 years. He also was on the editorial board of *Quarterly Review of Surgery*.

Dr. Jewett accumulated an impressive bibliography: his papers on the grading of both prostatic and bladder cancer established the present classification system for these tumors and the basis for rational treatment. Specifically, he introduced a way to examine the bladder and accurately stage the lesions. His work was recognized by many awards throughout his career; the most recent, in July 1988, was a Commendation of Merit Award from the AUA, the first made by the organization to honor the contribution of an outstanding physician.

Born in Baltimore in 1903, Dr. Jewett lived here much of his life. He received his AB in 1926 from The Johns Hopkins University, and graduated from the Hopkins School of Medicine in 1930. He completed his internship at Hopkins and then began his residency at St. Mary's Hospital in Pierre, SD. He rejoined Hopkins as an assistant resident in the Department of Pathology, then became a resident in urology. In 1934, Dr. Jewett accepted a residency at Ancker Hospital in St. Paul, MN. He returned the following year to complete his residency. Dr. Jewett joined the Hopkins faculty as an instructor of urology, and became a full professor in 1966.

Dr. Jewett served as a consultant from the Walter Reed Army Medical Center in Washington, DC. He also served as chairman of the Registry of Genitourinary Pathology of the Armed Forces Institute of Pathology, trustee of the American Urological Research Foundation Ind., president of Maryland Blue Shield, and councilor of the Med Chi Faculty.

In the 1972 unveiling of a portrait of Dr. Jewett commissioned by a grateful patient, then-president of Hopkins Hospital, Russell A. Nelson MD, paid this tribute: "We at Hopkins can testify to Dr. Jewett's great skill as a urological surgeon and as a doctor in care of patients.. . . He follows early Hopkins' greats in medicine."

Presidents of the three largest medical component societies in Maryland attended Baltimore County Medical Association's Annual Meeting last January. From the left, *Susan R. Guarnieri MD*, President of Baltimore City Medical Society; *Esther Edery MD*, President of Baltimore County Medical Association (holding the symbolic president's cane); and *Cheryl E. Winchell MD*, President of Montgomery County Medical Society.

■ ■ ■

R Adams Cowley MD, creator of Maryland's Shock Trauma System and a pioneer in the development of the science of trauma medicine, was honored on May 1 at ceremonies announcing the R Adams Cowley MD Fellowship, a newly created endowment that will sponsor specialized research in the area of trauma.

Special host for the ceremonies Governor William Donald Schaefer said that Cowley "established the nation's finest Shock Trauma system, which has earned Maryland a reputation for medical response that is unparalleled in America."

Governor Schaefer, former Governor Marvin Mandel, and a host of state officials were instrumental in supporting Dr. Cowley in creating the Maryland system (the only one of its kind nationwide), which annually saves the lives of thousands of trauma victims. Dr. Cowley retired in 1989 as Director of Maryland's Shock Trauma System.

The special Fellowship was created with an initial endowment made by the Charles McC. Mathias, Jr. National Study Center for Trauma and Emergency Medical Systems and the physicians from the Shock Trauma Center in Baltimore.

The National Study Center is located at the University of Maryland at Baltimore. A resource for information related to all aspects of trauma and emergency medical care, its goal is to help the country better understand the impact of serious injury and how best to deliver care to those who are injured. The idea of the Center also was an innovation of Dr. Cowley's and was created by and Act of Congress in 1986.

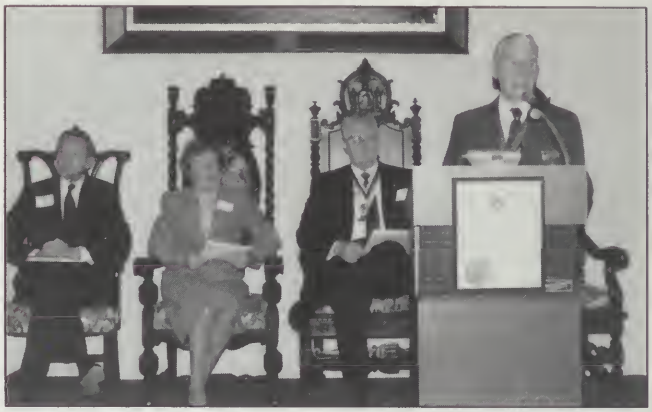
According to Harry Teter, Executive Director for the National Study Center, "Awards will be given to those individuals who are either established in the field of trauma research or who show great promise in researching trauma issues."

■ ■ ■

John M. Dennis MD, Dean of the University of Maryland at Baltimore School of Medicine and a member of its Class of 1945, recently received the 1990 Honor Award and Gold Key, awarded annually to a graduate of the school who has made outstanding contributions to medicine and distinguished service to mankind.

Dr. Dennis began his career at the University of Maryland at Baltimore in 1951 when he was appointed an Instructor and Associate at the Department of Radiology at the School of Medicine and University of Maryland Hospital. From 1953 to 1974, he was Professor and Chairman of the Department. He was named Dean of the School in 1974 and retired from the position on June 31, 1990.

As a boy growing up on Maryland's Eastern Shore, he lived next door to a family physician. "I never wanted to be anything else but a doctor," he says. World War II shortened his premed studies to three years; he then entered the University of Maryland at Baltimore School of Medicine pursuing an accelerated program guaranteed to graduate physicians to meet the anticipated demand for combat medical care. Dr. Dennis received his MD degree in 1945 and served in the Air Corps for two years following his graduation from medical school.



As Medical School Dean, Dr. Dennis spent 15 years prodding the US Congress and mobilizing key people to bring the Veterans Administration Hospital to the campus. He persistence paid off: construction of the 324-bed hospital began in 1987, a project that equates to a "$100 million endowment for the faculty and the research it will support, to say nothing of the educational opportunities for the students," Dr. Dennis says.

Dr. Dennis also piloted the campus itself, stepping

in as acting chancellor in 1985 following the death of Chancellor T. Albert Framer. Dennis provided crucial leadership after the state Legislature approved a bill that achieved separate governance for the hospital. With his guidance, a smooth integration of the hospital corporation and the Board of Regents, which oversees the rest of the campus, ensued.

Dr. Dennis counts as one of his biggest achievements the metamorphosis of the medical school from a "parochial" institution to one that "is not only recognized nationally for its education but also for its research," he says. Under his tenure, research grants awarded to the School of Medicine have increased by 77 percent in the last five years.

■ ■ ■

Admiral Henry P. Laughlin MD opened the Inaugural Congress of The National Congress of Patriotic Organizations in Washington last April, representing some 3,400,000 American patriots. From the left are Senator Orrin G. Hatch (Utah), keynote speaker; and hosts, Governors General Mrs. Eldred Martin Yochim DAR and James R. Westlake SAR.

A Med Chi Faculty member for nearly 40 years and an emeritus member of both the component Montgomery and Frederick County Medical Societies, Dr. Laughlin served as the Inaugural President and Moderator of the Congress.

At this same occasion Dr. Laughlin received from Governor William Donald Schaefer a Governor's Citation for his "impressive commitment to nurturing the vibrant traditions of freedom and democracy for which this great nation is widely respected, while carving out a legacy of civic pride and community service - as demonstrated by the outstanding contributions faithfully rendered by your many distinguished member organizations for the betterment of America and for the general well-being of our people...."

Currently Dr. Laughlin is Associate Editor of the *Maryland Medical Journal*, member of the Med Chi Council and President Elect of the Frederick County Medical Society. He was also the NCPO Congressional Delegate for the National Independence Day Festival and Parade Organization as Grand Marshal Emeritus. ■

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-in format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak

For more information contact Besty Newman at 301-539-0872 or in MD 1-800-492-1056.

A NOTE FROM THE SURGEON GENERAL TO PARENTS OF INFANTS

Parents Are The First To Know If Their Infants Cannot Hear.

When you check your baby's hearing, he/she should be happy and the room quiet.

DOES YOUR BABY SOMETIMES:

By Age Birth to 3 Months

- Startle or jump when there is a sudden loud sound?
- Stir or wake up and cry when someone talks or makes a noise?
- Recognize and be quieted and sometimes pacified by the sound of your voice?

By Age 3-6 Months

- Turn his/her eyes to look for an interesting sound?
- Respond to mother's voice?
- Turn his/her eyes toward you when you call his/her name?

By Age 6-12 Months

- Turn toward interesting sound and toward you when his/her name is called from behind? (Sounds need NOT be loud)
- Understand "no" and "bye-bye" and similar common words?
- Search or look around when hearing new sounds?

If your baby cannot do these things, check with your doctor.

PARENTS MUST PERSIST UNTIL THEIR CONCERNS ARE ANSWERED!

BY THE YEAR 2000, 90% OF ALL CHILDREN WITH A SIGNIFICANT HEARING IMPAIRMENT WILL BE IDENTIFIED BY 12 MONTHS OF AGE

IF YOU NEED ANY HELP REGARDING YOUR INFANT'S HEARING

IN MARYLAND CALL 1-800-633-1316

Please copy and distribute as widely as possible.

September 14

Current Concepts in Ophthalmology: Tenth Annual Clinical Conference, Columbia Inn, Columbia. Includes the Fourth Annual Lois A. Young-Thomas Memorial Lecture. Fee: $60; 6 AMA Cat I credits.

October 6-7

Sixth Annual Contact Lens Symposium, Stouffer Harborplace Hotel, Baltimore. Fee: $165 before September 21; 12 AMA Cat I credits.

December 7-8 Cancer in Minorities, Stouffer Harborplace Hotel, Baltimore. Fee and credits to determined. Info: S. Stenhouse 301-328-3956.

Continuously Throughout the Year

University of Maryland Dean's Conferences - Held monthly, October through April. Designed for the Family/General practitioner and Internist. Each conference highlights different clinical Departments placing emphasis on the practical methods being used and researched at the University of Maryland. Extension programs are planned to compliment the programs held on University's Baltimore campus.

Visiting Professor Program - Directory of speakers and topics available for area hospitals and other healthcare organizations. No administrative fee. Info: 301-328-3956.

Visiting Practitioner Preceptorships - Opportunity for physicians to participate in clinical situations in the University of Maryland Medical Systems. Requires approval from clinical department/division heads. Hour-for-hour Cat I credits available. Direct **all** inquiries to CME 301-328-3956.

Departmental Rounds and Conferences - Weekly, hands-on and lecture presentation hosted by the University's clinical departments. Hour-for-hour AMA Cat I credits available. Brochure available.

Physicians wanted for leading practice

Prestigious national group specializing in the treatment of venous disorders has exceptional opportunities in major metropolitan areas throughout the United States. We are in need of physicians trained in internal medicine, surgery or who have a broad based medical background to establish and direct a clinic as well as practice our state-of-the-art treatment techniques. We will provide complete training in the latest proprietary techniques of treating venous disorders. We offer an outstanding compensation package in the six figure area along with malpractice insurance and health benefits. Additionally, we offer a 40 hour work week, no weekend hours and freedom from beepers. You also won't have to worry about soliciting for patients or fighting insurance companies.

This is an outstanding opportunity for professional and financial advancement. If you are motivated to build a rewarding practice with the leader in the treatment of venous disorders, send your curriculum vitae to:

Because safety cannot be taken for granted in H_2-antagonist therapy

AXID®
nizatidine

Minimal potential for drug interactions

Unlike cimetidine and ranitidine,[1] Axid does not inhibit the cytochrome P-450 metabolizing enzyme system.[2]

Swift and effective H_2-antagonist therapy

- *Most patients experience pain relief with the first dose[3]*
- *Heals duodenal ulcer rapidly and effectively[4,5]*
- *Dosage for adults with active duodenal ulcer is 300 mg once nightly (150 mg b.i.d. is also available)*

AXID®
nizatidine capsules

Brief Summary. Consult the package literature for complete information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to eight weeks treatment. Most patients heal within four weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than one year are not known.

Contraindication: Known hypersensitivity to the drug. Use with caution in patients with hypersensitivity to other H_2-receptor antagonists.

Precautions: *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix® may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a two-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,900 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events was due to the drug.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to three times the upper limit of normal, however, did not significantly differ from that in placebo patients. Hepatitis and jaundice have been reported. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H_2-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H_2-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Because cross-sensitivity among this class has been observed, H_2-receptor antagonists should not be administered to those with a history of hypersensitivity to these agents. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance by approximately 84%.

Cholesterol Testing

With great sadness, *and anger*, I read the "Faculty Position on Cholesterol Testing" (which includes "Treatment Guidelines" and "Education and Referral") in your January 1990 issue.

The entire cholesterol *business* is propagated by self-serving physicians who are benefiting from the big-scare tactic. It is certainly a factor, but a small one, in the promotion of a longer life span, and this is now recognized by the medical profession and others.

Articles from *JAMA* (July 7, 1989) and the *New England Journal of Medicine* (September 7, 1989) have tried to put this entire topic into a proper context. The *Atlantic* magazine of September 1989 includes an article by Thomas Moore, whose ideas are becoming more and more accepted.

In December 1989 I took an intensive four and a half day course in Geriatrics at New York University; the topic of "cholesterol" was mentioned by two of the speakers, only to *dismiss* it as a concern in people over age 65.

I, for one, would like to cast a protest vote *against* the Faculty Position on cholesterol testing, etc., and would like to suggest that topic again be reviewed.

MORTON J. ELLIN MD
Randallstown

■ ■ ■

Response from the Committee on Public Health

The recommendations of the Committee on Public Health were formulated after reviewing the position of the recognized national authorities on the significance of cholesterol and cholesterol testing.

We determined that the American Heart Association, the American Medical Association, the American College of Cardiology, the National Heart, Lung, and Blood Institute, and most experts in the field of cardiology and lipid disorders agree that increased blood cholesterol is a significant risk factor for the development of coronary artery disease.

In light of this fact recommendations were made that:

1. Cholesterol testing should be made available to as many persons in Maryland as possible (including the indigent and poorly served population).
2. That laboratories (outside of those already controlled) should be supervised to assure the accuracy of results.
3. That some education should be included as part of the screening.
4. That they be referred to their primary physician or usual care facility for appropriate follow-up.

The treatment parameters espoused by us (and to which you object) are those promulgated by the only established national bodies that have taken a position, *viz.* the American Heart Association, the American Medical Association, the American College of Cardiology, and the National Heart, Lung, and Blood Institute.

It is certainly true that there is ongoing controversy and discussion as to the exact cholesterol values of significance and the age-stratified risk. However, at the time of publication the universally agreed upon recommendations were the only ones published by recognized authorities.

If in fact these national organizations modify their stand, then the treatment parameters promoted by us should also be modified.

HERMAN C. MAGANZINI MD, Chairman
Committee on Public Health
Medical and Chirurgical Faculty of Maryland

Lyme Disease

This is to alert Maryland physicians to the occurrence of Lyme disease in seronegative patients. Although current tests are now supposedly more sensitive, there are several reasons for falsely negative results:

First, the test may be performed too early in the course of the disease. Patients may require three to six months after the onset of the disease before antibodies appear in the blood.[1]

Second, antibiotic use may blunt a rise in titre or cause a patient to fail to produce antibodies.[2]

Third, treated Lyme patients may have negative serology but may still be symptomatic or relapsing with the later forms of the disease.[1]

The diagnosis of Lyme disease in the face of negative serology can still be made on the basis of:

1. Exposure to tick-infested areas.
2. History of a rash that may be urticaria, a malar rash, erythema nodosum, small evanescent patches and circles, as well as the classic erythema migrans (EM). *Note*: some patients never develop a rash.
3. Presence of rheumatologic, neurologic, and/or cardiac signs. In stage 2 Lyme disease, these symptoms are fluctuating; in stage 3 the symptoms are more constant.[2]

Where there is a suspicion of Lyme disease but serology is negative, a trial course of amoxicillin or IV

ceftriaxone may prove rewarding in the diagnostic work-up.

The current trend in treatment is to avoid tetracycline due to its bacteriostatic nature in early Lyme disease.[3] (Tetracycline is ineffective in late Lyme disease.[2]) The oral treatment of choice is amoxicillin at a dose of 500 mg tid or qid, or in allergic individuals, oral cephalosporins (Ceftin®). Therapy should extend two to three weeks beyond the resolution of all signs, with therapies of four months common in cases of uncomplicated late Lyme disease. Patients should receive nystatin, acidophilus, and B vitamins, and women should have access to vaginal antiyeast products.[3] IV therapy with ceftriaxone (4 g per day in divided doses) is indicated in advanced cases or where oral therapy has failed.[2] IV therapy should be followed by oral therapy as outlined above.[3]

Regardless of text read, early treatment of Lyme disease is emphasized to avoid more serious disease. Where there is a suspicion of Lyme disease, prompt attention and adequate therapy is imperative.

An excellent, well-referenced guide to Lyme has been published by the Wisconsin Department of Health called *A Clinician's Guide Lyme Disease*, and it may be obtained by calling the Maryland Department of Health at 301-225-6266. This text is outdated on its use of tetracycline, and several physicians and personal experience indicate that erythromycin is ineffective in the treatment of Lyme disease. However, the remainder of the text appears highly accurate and pertinent at this time.

Lyme disease is a rewarding disease to see treated and a devastating disease to ignore. I know, I've been there.

WENDY P. FEAGA DVM
Ellicott City

■ ■ ■

Commentary: Lyme Disease

Dr. Feaga correctly points out that the serologic testing for Lyme disease is problematic. One of the major concerns not mentioned is the rather extraordinary difference in performance by diagnostic kits used by various laboratories from different suppliers. The result is great variation in the accuracy with false-positive results, false-negative results, and perhaps the most frequent problem, equivocal results.

False-negative tests may be noted in the first stage of the disease since erythema chronic migrans (ECM) often predates seroconversion. Dattwyler *et al.*[1] have called attention to the possibility of false-negative tests in later stages of disease reflecting the effect of early therapy in blunting humeral response. Studies to demonstrate humeral immunity with immunoglobulin against *B. burgdorferi* were negative in 17 illustrative cases, but all showed a vigorous T-cell proliferative response to the putative agent. The implication was that early therapy caused a disassociation between T- and B-cell immune responses. However, the authors cautioned that such patients represent less than 5 percent of all patients with Lyme disease.

At present physicians will make the diagnosis of Lyme disease in the first stage by the clinical features, primarily the characteristic rash (ECM) along with appropriate symptoms and epidemiologic findings. This would constitute adequate information for therapy with doxycycline (100 mg bid) or amoxicillin (250-500 mg tid) for 10 to 21 days. For patients with neurologic, cardiac, or arthritic complications, the diagnosis generally will rest with the combination of the characteristic clinical features combined with positive serologic tests.

In my own practice are many patients who have rather vague symptoms that are compatible with Lyme disease accompanied by negative or equivocal serologic tests. The great majority of these probably do not have Lyme disease, but there is no way to be absolutely sure since the organism is rarely cultured and the serologic test used by Dattwyler *et al.* is not commercially available. I would favor empiric treatment of such patients only if they have typical symptoms accompanied by a history of early treatment for ECM.

With regard to the selection of agents for therapy, Dr. Feaga's comments are not in concert with the recommendations of consultants to the *Medical Letter*.[2] Their recommendations for treatment of early disease are summarized above. Specifically, there should be no reservation in using tetracyclines for adults with ECM since clinical efficacy appears comparable to that noted with bactericidal drugs. In stages 2 and 3 the usual recommendation is ceftriaxone (2 gm/day IV x 14 days) or penicillin G (20-24 million units/day IV x 10-14 days). For patients with less serious complications in stages 2 and 3 the recommendation is doxycycline (100 mg bid) or amoxicillin (250-500 mg tid) for three to four weeks.

JOHN BARTLETT MD, Chief
Division of Infectious Diseases
The Johns Hopkins University School of Medicine ■

Med-Chi members reading papers before organizations are invited to submit their papers to the MMJ *for consideration for publication.*

The *Maryland Medical Journal* is the monthly publication of the Medical and Chirurgical Faculty of Maryland. Its goals are educational and informative: the publishing of scientific articles and other technical information as well as editorials, special articles (evaluations, position papers, reviews of nonscientific subjects), membership news, notices of medical events, legislative and governmental news, meetings, continuing education courses, and programs and policies of the Faculty.

Manuscripts may be sent to Editor *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by the editor, editorial board members, and guest reviewers. The final decision is reserved for the Editor.

Specifications

When submitting manuscripts for review by *MMJ's* Editorial Board, please send an IBM compatible floppy disk with the document entered in a Word Perfect, Multimate, or Wordstar program. Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with margins of a least one inch. Number pages consecutively. Please submit two additional copies.

Include in the manuscript the concise title, full name of the author (or authors) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

An introductory synopsis/abstract of approximately 100-150 words is required.

Race, creed, color, national origin, or religion shall not be included in descriptions of case reports unless such information is a necessary contribution to clinical understanding.

Tables are to be typed on separate sheets of paper, numbered, and have a brief descriptive title. The Editor reserves the right to edit tables. Be sure that statistics are consistent in both tables and text.

References are limited to those citations noted in the text. References are to be typed double-spaced and numbered consecutively as they appear in text. They will be examined critically at the time of review and must be kept to a minimum. The number of references is generally limited to 20 in major contributions and fewer in shorter articles. Exceptions may be made if appropriate in the opinion of the reviewing editor. Personal communications and unpublished data should not be included. The following are necessary: names of all authors, complete title of article cited (lower case), name of journal abbreviated according to *Index Medicus*, volume number, first and last page numbers, and year of publication. For more extensive information about preparing medical articles for publication, the editors suggest the International Committee of Medical Journal Editors: Uniform requirements for manuscripts submitted to biomedical journals. The complete document is available in the June 1982 issue of the *Annals of Internal Medicine.*

Illustrations are material that cannot be set in type. *Photographic material* must be submitted as high-contrast, glossy prints. *Drawings and graphs* must be done professionally in india ink on high-grade white drawing paper or be computer generated. **Omit illustrations that do not increase understanding of text, and limit them to a reasonable number.** Four or fewer illustrations should be adequate for a manuscript of 4 to 5 typed pages. Identification should be typed on a gummed label and affixed to the back of each illustration: figure number, title of manuscript, name of senior author, and arrow indicating top. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs and drawings. **Cost of printing color photographs must be borne by the author.**

Recognizable photos of patients are to be masked and should carry with them written permission for publication.

Permissions. When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright. Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the author and *MMJ*.

Editorial Responsibility

Manuscripts are subject to editorial modification and such revisions necessary to bring them into conformity with *MMJ* style.

Galley proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

Statements made or opinions expressed by any contributor in any article or feature published in *MMJ* are the sole responsibility of the author. ■

Rural Training Initiatives in Adolescent Health

The Cumberland Area Health Education Center (CAHEC) recently was awarded a two-year grant to initiate a multifaceted health professional training program in adolescent health. The grant from the AHEC Division of the Department of Health and Human Services, Bureau of Health Professions will begin in the fall of 1990. The project, Rural Training Initiatives in Adolescent Health, is designed to improve clinical responsiveness to the medical and healthcare needs of adolescents, increase adolescent outreach programming by health professionals, and improve multidisciplinary coordination in adolescent care.

The program will provide the health professional community with update training in many topics including substance abuse, depression, suicide prevention, AIDS counseling, and prevention of teen pregnancy. Efforts will be aimed at increasing adolescent comfort in seeking medical care and in confiding in the medical profession and establishing model school-based services that incorporate physician participation and the development of an adolescent consumer health education campaign.

The initiative was developed with the input and support of many Western Maryland health professionals and educators. According to Don Spencer, Executive Director, "When the concepts for this program were being developed in 1988, CAHEC's Interdisciplinary Health Education Council convened a roundtable to discuss adolescent needs and services....From these meetings and many hours of research and consultation the training initiative was designed." Implementing the initiative will involve physicians, health professionals, educators, public health officials and many community agencies.

CAHEC is an organization in the Maryland Statewide Medical Education Training System. In cooperation with the University of Maryland at Baltimore, the Center provides rural health professional experiences for medical and healthcare students and residents. The Center also provides off-campus education programs, offers continuing education for health professionals, conducts health promotion and community education projects, creates interagency networks, and maintains a learning resource center.

For information on the adolescent training initiative or CAHEC, call 301-777-7150.

Help Preserve Med Chi's Historic Book Collection

Med Chi is the owner and guardian of a national treasure: the library's collection of historic books, journals, and manuscripts. In anticipation of the Bicentennial of the Faculty in 1999, the Library and History Committee is about to undertake responsibility for the preservation and restoration of this singular collection.

We would like to tap an important resource, our retired physician members of the Faculty, to form a small cadre of volunteers who, during daytime hours, could assist archivist William Sleeman in inspecting the collection for items that require first aid.

If you are a bibliophile who would enjoy the opportunity to gain a hands-on acquaintanceship with this widely acclaimed historical assemblage, please contact Adam Szczepaniak at the Faculty 301-539-0872 or 1-800-492-1056 in Maryland. ■

Doctor, Planning to Relocate?

PHYSICIANS, THERE ARE TWO KINDS OF FLEXIBILITY IN THE ARMY RESERVE WE THINK YOU'LL LIKE.

One, time. We know how tough it is for a busy physician to make weekend time commitments. So we can offer the kind of flexible time scheduling that allows a physician to share sixteen hours a month with his or her country. We can arrange a schedule to suit your requirements.

Two, the opportunity to explore other phases of medicine, to add a different kind of knowledge—the challenge of military health care. It's a flexibility that could prove to be both stimulating and rewarding, with the opportunity to participate in a variety of programs that can put you in contact with medical leaders from all over the country.

See how flexible we can be; call our Army Medical Personnel Counselor:

Major Michael W. Salmons
(301) 997-3526/4204

BE ALL YOU CAN BE.
ARMY RESERVE

PIE's quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. PIE Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

QRP FACTS:

Strict Underwriting Criteria – Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

Scheduled Premium Reductions – Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

High Limits – Backed by our reinsurer, Lloyd's of London, PIE is able to offer higher coverage limits for qualifying doctors: up to $7 million for individual doctors and $13 million for group policies. Lloyd's of London is the largest reinsurer in the world.

Designed With Input from Doctors – PIE's QRP plan is an innovative modified claims-made insurance specially designed with input from PIE-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your PIE representative, or our headquarters office today.

The choices you make now may make all the difference later.

The decisions you make in a crisis will have a lasting impact on your patient's health. In the same way, the medical malpractice insurer you choose now may make all the difference to your professional and financial well-being in the years ahead.

When you choose Princeton, you're choosing a company with a solid track record. A company with years of experience providing professional liability insurance for physicians, and a history of successfully defending policyholders against meritless claims.

You're also choosing a company that's flexible enough to design policies that meet your individual coverage needs. Our innovative *Occurrence Plus* policy, for example, combines the best features of standard occurrence and claims-made and offers you the broadest insurance protection available.

And coverage is only half the story. Princeton has seasoned specialists working on your behalf -- so service is prompt and professional. Plus, our team of risk management consultants is ready to answer your questions, or arrange on-site educational programs.

Whether it's your patient's future, or your own, that's on the line, making the right choices is critical. Choose the insurer that offers experience, flexibility and service. Choose Princeton. Call your independent insurance agent today.

PRACTICAL CLINICAL MANAGEMENT: DRUG ABUSE EDUCATION FOR THE PRIMARY CARE PHYSICIAN

Saturday & Sunday, October 20 - 21, 1990

Convention Center
1 East Pratt Street
Baltimore, Maryland

12 credit hours in Category I of the PRA/AMA
THIS PROGRAM HAS BEEN REVIEWED AND IS ACCEPTABLE FOR 12 PRESCRIBED HOURS BY THE AMERICAN ACADEMY OF FAMILY PHYSICIANS

The problems of alcoholism and drug addiction are ever-present in our society. The primary care physician, indeed all physicians, must be able to recognize these problems. MED CHI proudly offers the opportunity for primary care physicians to enhance their knowledge base in this critically important area. Those attending this conference will have the chance to obtain a working knowledge of the problem and learn practical techniques that can be utilized to the benefit of their patients.

The Medical and Chirurgical Faculty is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

SATURDAY, OCTOBER 20

8:00am- 8:30am **REGISTRATION**
(continental breakfast)

8:30am- 9:00am **OPENING REMARKS - OVERVIEW OF THE PROBLEM- DAY 1 SCHEDULE REVIEW**
Governor William Donald Schaefer
Nelson Goodman, M.D., Chairman, MED CHI Committee on Drugs

9:00am- 9:45am **THE EPIDEMIOLOGY OF DRUG ABUSE**
Herbert D. Kleber, M.D., Deputy Director for Demand Reduction, Office of National Control of Drug Dependency, Executive Office of the President of the United States.
An overview of drug abuse and its impact on medicine.

9:45am-10:00am **BREAK**

10:00am- 11:00am **EARLY DETECTION AND MANAGEMENT OF THE ALCOHOLIC**
Charles Whitfield, M.D., Whitfield Associates
How the primary care physician can identify, diagnose and assist in the treatment of the alcoholic patient.

11:00am-11:15am **BREAK**

11:15am-12:00pm **HEROIN ABUSE AND MANAGEMENT**
Donald Jasinski, M.D., Chief, Center for Chemical Dependence, Francis Scott Key Medical Center
Overview of the heroin abuse problem in America, its impact on medicine. Management of the heroin addict and how the primary care physician can assist in treatment.

12:00pm-12:45pm **THE HEALTH DEPARTMENT AS A RESOURCE TO THE PRIMARY CARE PHYSICIAN**
Maxie Collier, M.D., Commissioner of Health, Baltimore City Health Department
How the primary care physician can utilize the services of the Health Department in the education, prevention, and treatment of drug abuse.

12:45pm-2:00pm **LUNCH and GUEST SPEAKER**
Bonnie B. Wilford, Director, Department of Substance Abuse, American Medical Association

2:00pm-2:45pm **BEHAVIORAL ASPECTS OF ADDICTION**
George Bigelow, Ph.D., Director, Behavioral Pharmacology Unit, Johns Hopkins University
An examination of addiction treatment utilizing a behavioral approach.

2:45pm-3:30pm **LEGAL ASPECTS OF TREATING THE ADDICT: ESSENTIALS FOR THE PRIMARY CARE PHYSICIAN**
Alexander Williams, Esq., States Attorney for Prince George's County
What the physician must know about Maryland Law as it pertains to treatment of drug-addicted patients.

3:30pm-3:45pm **BREAK**

3:45pm-4:30pm **BENZODIAZEPINES AND CHEMICAL DEPENDENCE: CLINICAL GUIDELINES**
Robert DuPont, M.D., former Director, National Institute on Drug Abuse; President, DuPont Associates, P.A., Clinical Professor of Psychiatry, Georgetown University School of Medicine.
Recognition and treatment of the benzodiazepine abuser. Proper utilization of benzodiazepines.

4:30pm-5:15pm **PET SCAN MAPPING OF THE CEREBRAL EFFECTS OF ABUSED DRUGS**
Edythe D. London, Ph.D., Chief, Neuropharmacology Laboratory, National Institute on Drug Abuse, Addiction Research Center
An examination of the metabolic effects of abused drugs, including alcohol, in the brain in an effort to better understand the neurobiological mechanisms by which drugs alter mood, and produce "euphoria."

5:15pm-6:15pm **RECOGNITION AND MANAGEMENT OF THE ADDICT IN THE CLINICAL SETTING**
Sidney Schnoll, M.D., Ph.D., Division of Substance Abuse, Medical College of Virginia
Techniques the primary care physician can use in recognizing, diagnosing, and assisting in the treatment of patients with drug addiction.

6:15pm **ADJOURNMENT DAY 1**

Maryland Physicians: Thanks To You, It Works.

The history of Medical Mutual is really the story of physicians working together to surmount complex problems which had defeated others. Through cooperation, persistence and the strength to make difficult decisions, the physicians of Maryland have set an example for the rest of the country.

It all began, of course, in 1975 when the major medical malpractice insurers announced they were leaving Maryland. Spiraling malpractice awards and the prospect of large-scale losses, the companies said, made it impossible to do business in Maryland. As the potential threat to public health became evident, many people feared that health care delivery in the State was on the verge of collapse.

With no relief in sight, physicians, citizens, and the General Assembly worked together to create what had never before existed anywhere — a medical professional liability insurance company owned and directed by its physician members. On June 3, 1975, Medical Mutual was created.

Over the past 15 years, other companies have come, and gone, and come again — entering Maryland when there were profits to be carried away, and leaving whenever times got tough. Through it all, Medical Mutual's physicians have proved that their long-term commitment was the right choice.

For 15 years, our thousands of physician members have been at the heart of what we are, and we are unique because of your needs, your insight, and your guidance.

The success we have earned was by no means universally predicted in 1975. But we survived those difficult first years, and now, 15 years later, we are proof of what physicians can do when they work together for a common goal.

Thanks to you, it works.

Caring with Excellence

Making the right choices means asking the right questions.

You know the questions to ask your patients. Questions that will provide the information you need to make an informed decision about medical treatment.

When it comes to choosing a medical malpractice insurer, knowing which questions to ask--and how to interpret the answers--is no less important. Because just as your treatment decisions may have a lasting impact on your patient's long-term health, your choice of insurer may make all the difference to your professional and financial well-being in the years ahead.

In an uncertain medical situation, you might consult a specialist. When you're making decisions about insurance, why not consult with an insurance specialist? An expert who can suggest which questions to ask, guide you through the technical jargon, and help you select the coverage that's right for you.

That's where Princeton's network of independent insurance agents comes in. Our agents understand the insurance needs of health care professionals. They'll show you how to compare costs and benefits, and help you avoid gaps or duplications in coverage.

Do ask an agent why Princeton should be your choice. Ask about our financial strength, about our claims management philosophy that vigorously defends physicians against meritless claims...and about our new office package policy that offers protection for your practice and premises. We think you'll like the answers.

Cover: The medallion, gavel, and Maryland flag featured on the cover are important elements in the inaugural ceremony for the President of the Medical and Chirurgical Faculty of Maryland. The colors of black and gold on the Maryland flag represent the Calvert family, while red and white represent the Crossland family. The mother of George Calvert, the first lord of Baltimore, was in the Crossland family. It is only fitting then that the colors of red and white be worn by the leadership of Med Chi and the gold and black be worn by successive leaders. The gavel signifies the change of presidency.

During the ceremony, the incoming president receives the gavel and medallion with the red and white ribbon and recites the following oath:

> I solemnly swear, that I shall to the best of my ability, carry out the duties of the office of the President of the Medical and Chirurgical Faculty of Maryland, and that I shall strive constantly to uphold the ethics of the medical profession, and to promote the health and welfare of the public, further that I shall dedicate myself and my office to the improvement of health standards for all the people, and to the task of bringing increasingly improved medical care within the reach of every citizen, and that I shall uphold the constitution and bylaws of the Medical and Chirurgical Faculty of Maryland at all times.

WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, PIE Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality. PIE Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

Physician Managing Boards, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

Quality Rated Insurance Program: a modified claims-made plan which works in the physician's favor to reward loss-free physicians and provides added protection not available in other policies.

A Financially Sound Reinsurance Program with Lloyd's of London, the world's most prestigious reinsurer.

An Aggressive Defense Team, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

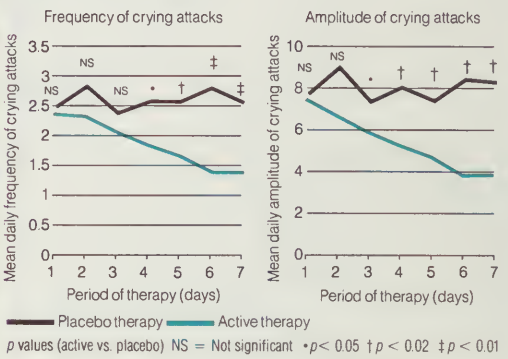
SO WE CAN HOLD THE PREMIUMS DOWN.



Family therapy for colic.

The excessive crying of colic puts a strain on the most loving family–and often on their physician as well. And whatever the cause of colic, one fact is clear:

Gas is often part of the colic problem.

New Phazyme Drops contains simethicone, which can safely break up gas and bring baby relief. That's why it can help whenever colic is a problem.

Significantly reduces crying of colicky infants.[1]

p values (active vs. placebo) NS = Not significant •$p < 0.05$ †$p < 0.02$ ‡$p < 0.01$

Double-blind, randomized, placebo-controlled study.

Priced 25% below the leading brand.

This significant price advantage will be particularly important to parents, since they may be relying on Phazyme Drops for up to three months. And it's naturally flavored–something else they'll appreciate.

NEW **Phazyme®** **Drops** (simethicone/antigas)

Helps you through the colic phase.

Selected Communicable Diseases in Maryland in 1989

(Continued)

HEPATITIS B (668)

14.3/100,000 (U.S. 9.2/100,000)

The ten year trend of hepatitis B in Maryland is shown in Figure 7. The incidence rate in 1989 decreased slightly from that in 1988 (15.1/100,000). This decline was most noticeable in Washington, Frederick and Cecil counties. The number of cases by county is shown in Table 1 (see July, 1990 issue). No seasonal

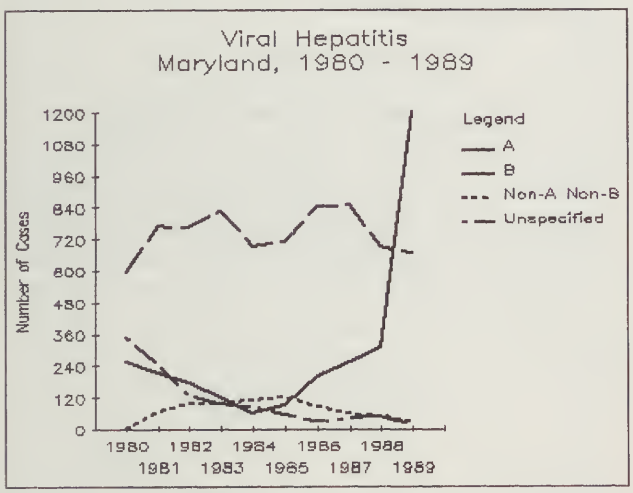

Figure 7

difference in onset of illness was observed. The male to female ratio was 1.5:1.0. The rate in whites was 8.5/100,000 and in nonwhites, 21.4/100,000. The rates per 100,000 by age group are shown in Figure 8.

A 54% increase from 1988 of reported cases in Baltimore City resulted in the highest rate (39.5/100,000) in the State. Forty-four percent of all cases in Maryland were Baltimore City residents. In the City, the male to female ratio was 1.7:1.0. The rate in whites was 26.6/100,000 and in nonwhites, 36.8/100,000. The 20 to 29 year age group had the highest incidence rate (87.8/100,000), followed by the 30 to 39 year age group (76.6/100,000).

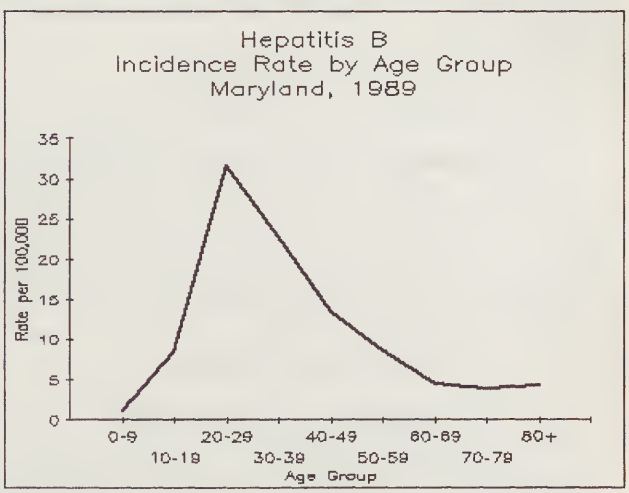

Figure 8

Information on exposure during the 6 months prior to onset of illness and probable source of infection was available on only 215 (32.2%) of the cases: 100 (46.5%) reported drug use (an increase from 40.9 % in 1988), 42 (19.5%) had contact with confirmed or suspected hepatitis B case, 15 (7.0%) - sexual exposure (hetero-, homo- and unspecified sexual activity), 10 (4.7%) - dental work, 6 (2.8%) - blood transfusion; 6 (2.8%) - surgery (including dental surgery), 5 (2.3%) - per-

cutaneous exposure (other than IV drug use, needlestick, tattoo, etc.), 5 (2.3.%) - hospitalization (unrelated to hepatitis B illness), 4 (0.9%) - needlestick, 1 (0.5%) - prenatal exposure, 1 (0.5%) - tattooing, 1 (0.5%) - ear piercing, and 18 (8.5%) - other exposures.

HEPATITIS NON A-NON B (28)

0.8/100,000 (U.S. 0.9/100,000)

The decline in the rate of nonA-nonB hepatitis which started in 1985 continued, except in Cecil County with the highest rate (7.1/100,000) in the State.

The number of cases by county is shown in Table 1 (see July, 1990 issue). No seasonal pattern was observed; cases occurred throughout the year. Eighty-six percent of the patients were white, 10.7% black, and 1 had unspecified race. The male to female ratio was 0.8:1.0. Fifty-seven percent (57.1%) were 20 to 44 years of age with peak incidence among 30 to 34 year olds; 42.9% were over 50 years of age.

Suspected source of infection during the 6 months prior to the onset of illness was reported for only 9 of the cases (32.1%):4 had received blood or blood products by transfusion, 2 had surgery, 1 - tattooing, 1 - sexual contact of a case of nonA-nonB hepatitis, and 1 patient was a homosexual IV drug user.

LEGIONELLOSIS (35)

0.8/100,000 (U.S. 0.5/100,000)

Twenty-four (68.6%) of the cases in Maryland in 1989 were laboratory confirmed; 10 (28.6%) were classified as probable cases since not all laboratory tests were known, and 1 patient refused testing. Legionellosis occurred throughout the year; no seasonal pattern was observed. The number of cases by county is shown in Table 1 (see July, 1990 issue).

The male to female ratio was 1.7:1.0. Ages ranged from 20 to 83 years (median 64.5 years). The incidence rate by age group is shown in Figure 9. The ratio of whites to non-

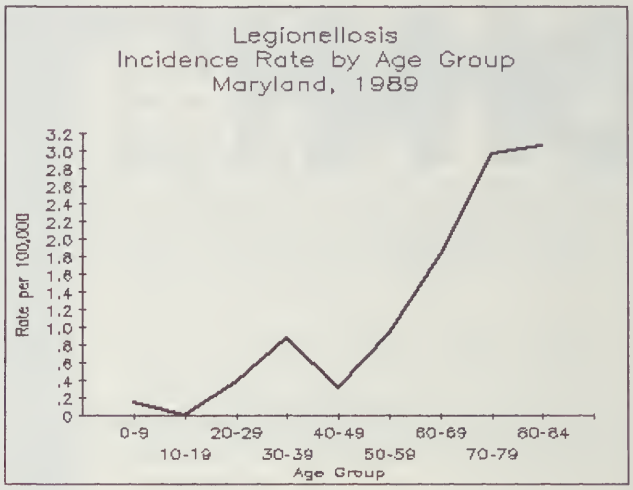

Figure 9

whites among the 31 persons with known race was 4.2:1.0.

At least 8 of all reported cases had underlying medical conditions such as cancer, diabetes mellitus, systemic corticosteroid treatment or were smokers (>10 cigarettes/day). There were 2 deaths attributed to legionellosis; both of these cases had serious underlying illness.

LYME DISEASE (138)

3.0/100,000 (U.S. Not Available)

Lyme disease is defined as a tick-borne disease with initial skin lesion (erythema migrans) and rheumatologic, neurologic and cardiac late manifestations. For the purposes of national surveillance, a case of Lyme dis-

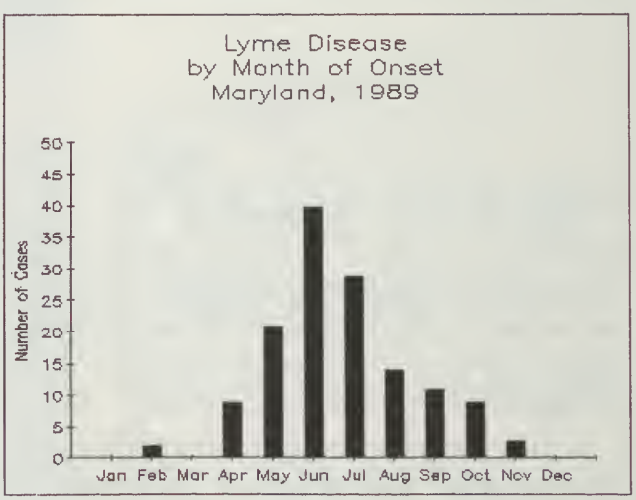

Figure 10

ease is a person with erythema migrans, or a person with at least one late manifestation and laboratory confirmation of infection (isolation of *Borrelia burgdorferi* from tissue or body fluid, or detecting IgM or IgG antibodies to *B. burgdorferi* in serum or CSF, or detecting significant change in antibody levels in paired acute and convalescent serum samples.)

There was a 150% increase from 1988 in the number of reported cases of Lyme disease. A few factors might have contributed to this dramatic increase: increasing awareness of Lyme disease among physicians and the public, adding Lyme disease to the list of reportable diseases in Maryland in 1989, and systematic investigation and follow-up of laboratory reports for Lyme disease received at the Center for Veterinary Public Health. An actual increase in the incidence is not an unrealistic possibility.

The cases by counties are reflected in Table 1 (see July,1990 issue). Kent, Queen Anne's, Calvert and Charles counties showed the highest incidence rates for 100,000 population. The male to female ratio was 1.0:1.0. The race distribution was as follows: 123 (89.1%) were white, 9 (6.8%) black, 3 (2.2%) Asian, 1 (0.7%) American Indian, and the race of 2 (1.4%) patients was not known. The age of the cases ranged from 1 to 89 years (median 32.5 years). The age distribution between the sexes was not significantly different. The most affected age groups were 30 to 39 years with 31 (22.5%) cases, less than 10 years with 27 (19.6%) and 20 to 29 years with 22 (15.9%) cases. Peak incidence was observed in May, June, and July with 21, 40 and 29 cases respectively (Figure 10). One hundred (72.5%) cases had the characteristic rash (erythema migrans), 40 (29.0%) arthritis, 29 (21.0%) neurological symptoms (Bell's palsy or meningitis), 2 (1.4%) cardiac signs along with neurologic symptoms.

Twenty-six (18.8%) cases needed hospitalization. Definite tick bites were reported in 59 (42.8%) cases and possible tick bites in 33 (23.9%). In general, exposures and tick bites were reported to have occurred within the jurisdiction of residence.

MALARIA (42)

0.9/100,000 (U.S. 0.5/100,000)

More than 83% of all cases in Maryland were reported from Montgomery and Prince George's counties. Ages ranged from 18 months to 60 years (median 28 years); the age of one patient was unknown. Twenty-four (57.1%) of the patients were black, 8 (19.0%) were Asian, 3 (7.1%) white, 2 (4.8%) Hispanic, and 5 (12.8%) were of unknown race. Twenty-seven (64.3%) patients acquired malaria in Africa, 7 in India, 1 in Afghanistan, 1 in Central and 1 in South America; the country for 5 cases was not reported. Cases with confirmed Plasmodium falciparum (24) were exposed in India (4), Africa (2), Afghanistan (1), Nicaragua (1), and in unknown country (1); those with P. vivax were exposed in India (4), Africa (2), Afghanistan (1), Nicaragua (1), and in unknown country (1), and 1 patient with diagnosed P. ovale was exposed in Africa. No data on chloroquine resistance of the P.falciparum cases was available.

MEASLES (122)

2.6/100,000 (U.S. 6.5/100,000)

Eight separate outbreaks, four of which involved high schools in 3 different counties contributed to the dramatic almost 6.5 fold increase of the reported measles cases in 1989 compared to 1988. Previously, a similar increase occurred in 1985. The ten year trend of measles in Maryland is presented in Figure 11. The Montgomery/Prince George's area was hardest hit by a community-wide outbreak among preschool children. Ten of the 24 counties in Maryland reported at least 1 case. Three peaks months of onset of measles were observed: May, August, and December. The age of the cases ranged between 6 months and 44 years. The age distribution is shown in Figure 12. The male to female ratio was 1.0:1.0. The whites to blacks ratio was 1.6:1.0. The ratio of imported to indigenous measles was 0.5 : 1.0. Of 15 preschool cases (16 months through 4 years of age), only one (6.7%) had been immunized; 45 of 55 (81.8%) of school age cases (5 through 18 years old) had been immunized; 24 (53.3%) of the 45 who had

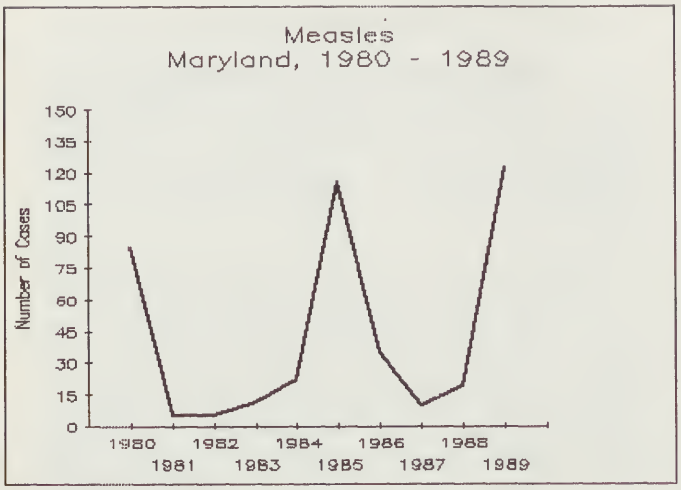

Figure 11

been immunized had received vaccine prior to 15 months of age.

The new ACIP and AAP Guidelines for Measles Control issued in 1989 recommend a second dose measles-mumps-rubella (MMR) vaccine for all children; the ACIP recommends the second dose at school entry while the AAP recommends the second dose at middle school entry. DHMH supports the second dose at middle school entry.

MENINGITIS, VIRAL (ASEPTIC) (246)

5.3/100,000 (U.S. 4.0/100,000)

Increased morbidity, mainly in Baltimore, Montgomery, and Prince George's counties, contributed to the 15.5% increase over the number of reported cases in 1988. All counties, except Garrett County, had at least 1 case (Table 1; see July, 1990 issue).

The highest rate (26.6/100,000) was observed in Dorchester County and was due to a cluster in September and October of 7 cases, 3 of whom were 1 to 5 months old. Overall, the onsets of illness were concentrated in the summer months. The male to female ratio was 1.2:1.0. The whites to nonwhites ratio was 1.8:1.0; for 11 individuals the race was unknown. More than one-third (34.1%) of all patients were 20 to 34 years of age; over one-fifth (21.1%) were less than 7 months of age, including 18 newborns. The etiology (enterovirus) was reported for only one case.

MENINGOCOCCAL DISEASE (78)

1.7/100,000 (U.S. 1.0/100,000)

An increase of 36.8% in the number of reported cases of meningococcal disease was observed in 1989 (Figure 12). More than one-third (34.6%) of the cases were diagnosed in the winter (January, February and December), and another 31% in May, June, and July. Thirteen counties and Baltimore City reported cases (Table 1; see July, 1990 issue). The highest number of cases (13) was reported from Anne Arundel County for a rate of 3.0/100,000.

The male to female ratio was 1.1:1.0. The white to black ratio was 4.1:1.0; the race of 6 individuals was unknown. While cases were noted in every age group, 31 percent were less than 18 months of age, including 12 (15.4%) between 1 and 5 months of age. No newborns were affected.

Forty-one (52.6%) patients presented with meningitis, 26 (33.3%) with meningococcemia, 4 had pneumonia, 3 pharyngitis, 1 otitis media, and 3 infections were not specified.

For 20 of the cases, the serogroup of the *N. meningitidis* was reported as follows: B (8), C (5), A (3), W135 (3), and Y (1). Seven (11.5%) of 61 patients (1 day to 75 years of age) for whom outcome was known, died, 2 had meningitis, 4 meningococcemia and 1 pneumonia. (Continued Next Month)

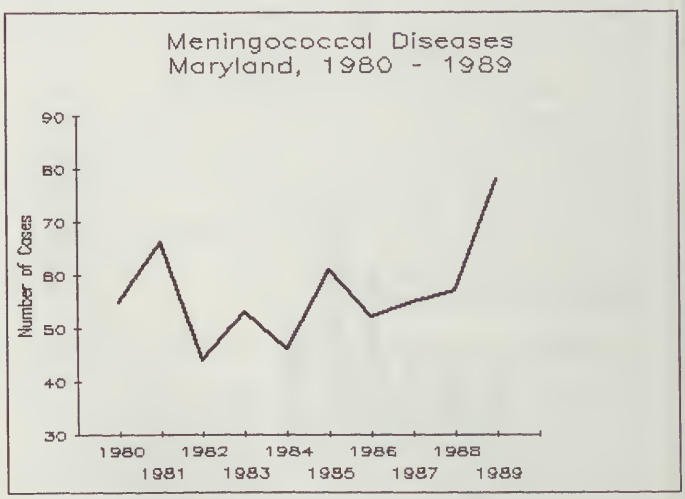

Figure 12

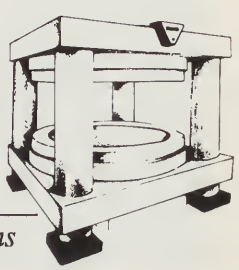
A MEDICAL TEST SHOULD **NOT** SCARE PEOPLE HALF TO DEATH!



Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and pediatrics. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Greater Baltimore MRI Center, Inc., we make it easier for you to diagnose your patients' problems.

Magnetic Resonance Imaging without claustrophobia or noise associated with other systems

Because safety cannot be taken for granted in H_2-antagonist therapy

AXID®
nizatidine

Minimal potential for drug interactions

Unlike cimetidine and ranitidine,[1] Axid does not inhibit the cytochrome P-450 metabolizing enzyme system.[2]

Swift and effective H_2-antagonist therapy

- *Most patients experience pain relief with the first dose[3]*
- *Heals duodenal ulcer rapidly and effectively[4,5]*
- *Dosage for adults with active duodenal ulcer is 300 mg once nightly (150 mg b.i.d. is also available)*

AXID®
nizatidine capsules

Brief Summary. Consult the package literature for complete information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to eight weeks of treatment. Most patients heal within four weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than one year are not known.

Contraindication: Known hypersensitivity to the drug. Use with caution in patients with hypersensitivity to other H_2-receptor antagonists.

Precautions: *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix® may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a two-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,900 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events was due to the drug.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to three times the upper limit of normal, however, did not significantly differ from that in placebo patients. Hepatitis and jaundice have been reported. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H_2-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H_2-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Because cross-sensitivity among this class has been observed, H_2-receptor antagonists should not be administered to those with a history of hypersensitivity to these agents. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance by approximately 84%.

Adjuvant Therapy For Carcinoma of the Rectum

Adjuvant therapy is a therapeutic modality which is to be initiated within four weeks of potentially curative surgery in patients who are at high risk of recurrence or metastases such as those with Dukes' B or C carcinoma. Three studies will be reviewed in order to place the current status of adjuvant therapy for this disease into perspective.

The Gastrointestinal Tumor Study Group (GITSG) was the first to report a beneficial effect for adjuvant therapy.[1] Because of the influence that their findings may have on the management of patients with rectal cancer, it is essential to review these data. Protocol 7175 started patient accrual in 1975 and was terminated in September 1980, after 227 patients were randomized; 202 of whom were available for evaluation. In this study, the rectum was identified as 12 cm from the anal verge. These patients were randomized into four treatment arms after potentially curative surgery: 1. Control: no further treatment; 2. Chemotherapy: 5-FU and Methyl-CCNU; 3. Radiation therapy: 4000 to 4800 rad over 4 1/2 to 5 1/2 weeks; 4. Combination of 2 and 3. The initial projected sample-size estimates were for 520 patients to be evaluated in order to detect a 50 percent increase in median survival time from 2 to 3 years. In February 1980, it was noted that one of the randomized arms was inferior to the other three. The group with the poorest results proved to be the control group, and therefore, no more patients were entered into this arm. However, the protocol was discontinued shortly after this time, leaving a small number of patients in each group and not meeting the required quota; 58 were control, 48 received chemotherapy, 50 received radiation therapy, and 46 combination therapy.

The results at 80 months of follow-up revealed recurrence rates of 55 percent in the control group, 46 percent in the chemotherapy-treated group, 48 percent in the radiotherapy-treated group, and 33 percent in the chemoradiation-therapy treated group (P=.000). The strongest therapeutic benefits were evident in patients with Dukes' C lesions with fewer than 5 positive nodes. Analysis at site of recurrence again suggested an advantage in favor of the combined treatment arm. While the early results indicated no overall survival benefits, subsequent analyses have suggested survival benefits for the combined treatment. However, two treatment-related deaths in the combined treatment arm were attributed to radiation enteritis. The toxicity of this combined therapy has been addressed in GITSG protocol 7180, comparing 5-FU+Methyl-CCNU vs 5-FU only with the radiation. Such data must be regarded as a major conceptual advance, and as an important initial indicator of the value of adjuvant therapy in those patients with Dukes' B and C disease. However, with only 46 patients available in the group demonstrating the greatest benefit and with the magnitude of major toxicity encountered, it would be premature to apply to patients outside the context of clinical trials.

The North Central, Duke, and Mayo Clinics conducted two-arm studies. Two-hundred patients were randomized to receive radiation therapy or radiation therapy together with chemotherapy (Methyl-CCNU and 5-FU).[2] In this study, the radiation therapy was deferred until the full cycle of chemotherapy was administered in the hope of avoiding the delays of the initiation of the chemotherapy noted in GITSG 7175.[1] The early results strongly suggest that a combination of chemotherapy and irradiation is superior to radiation therapy alone. Recurrences were noted in 38 patients (20 local) in the radiation group, compared to 23 (11 local) in the combined treatment group. Seven patients developed major radiation enteritis.

The National Surgical Adjuvant Breast and Bowel Project (NSABP) initiated their first study, Protocol-R-01, in 1977. They randomized 574 patients with Dukes' B and C rectal cancers into three treatment arms after potentially curative surgery: 1. Control: no further treatment. 2. Chemotherapy: 5-FU+Methyl-CCNU+Vincristine. 3. Radiation therapy: 3,200 to 4,000 rads in 18 to 22 fractions at the central midline. In this study, rectal tumors were defined as those that required opening of the pelvic peritoneum during surgery to reach for the lower end (distal margin) of the tumor. At 78 months of follow-up, there was a significant disease-free survival advantage in favor of the group receiving chemotherapy compared to the control (P=.005) with an overall survival advantage that is significant at P=.03. Futhermore, the disease-free survival was more significant in the male patients (P<.001). On the other hand, there was no difference in disease-free survival or overall survival when radiotherapy was compared to the untreated control. However, there was reduction in the incidence of loco-regional recurrence from 25 percent to 16 percent (P=.06).[3]

Three patients, out of 574 patients who were treated with 5-FU and Methyl-CCNU on colon and rectal protocols by NSABP, developed acute non-lymphocytic leukemia, compared to seven of 94 patients on GITSG Protocol 7175. In addition, one patient developed delayed nephrotoxicity on the NSABP studies which is dose-related to Methyl-CCNU administration.

In the mean time, preclinical pharmacologic interactions predicted increased efficiency of 5-FU with the addition of leucovorin. In a phase III clinical trial, high dose leucovorin + 5-FU was found to have a much higher response rate in patients with metastatic colorectal cancer.[4] The gastrointestinal toxicity, main-

ly in the form of severe diarrhea, is a serious side effect for patients receiving leucovorin modulated 5-FU, especially during the first course. Failure to modify doses or failure to provide I.V. supportive care can result in fatal gastrointestinal/renal toxicities.

Based on the above findings, the NSABP established Protocol R-02, in which male patients who have undergone curative surgery and have been found to have Dukes' B or C disease will be randomized to receive: 5-FU+Methyl CCNU+vincristine with or without radiation therapy, or leucovorin modulated 5-FU with or without radiation therapy. On the other hand, the female patients will be randomized to receive (no 5-FU, Methyl-CCNU, and vincristine) leucovorin modulated 5-FU with or without radiation therapy. This study is open for patient accrual.

E. GEORGE ELIAS MD, PhD
Professor of Surgery & Oncology
Director, Surgical Oncology Program

Tumor conferences are held weekly on Tuesday between 8-9 a.m. in Room N13E28 at the University of Maryland Medical System. Physicians are welcome to attend this open meeting and to present cases and pathological slides. Call 328-5224 by noon Monday to be placed on the schedule.

If you have any questions, call or write the Surgical Oncology Program, University of Maryland Medical System, Room N13E02, Baltimore, MD (301-328-5224).

You just filed a claim with the wrong subscriber number. You'll be alerted of the error and have it corrected in *24 hours or less.*

That's just one way LifeCard has made submitting insurance claims 100% faster and easier.

Whether or not you currently use a computer for billing, LifeCard lets you reach the following insurance carriers electronically.

Blue Cross and Blue Shield of Maryland
Maryland Medicaid
Medicare B
Blue Cross and Blue Shield of the National Capital Area
Aetna
Connecticut General (CIGNA)
Equicor
Metropolitan
The Travelers
Benefit Trust Life
Confederation Life
Great Southern Life
Guardian Life
John Hancock
Life of Georgia
Pacific Mutual
Philadelphia Life
Principle Mutual Life
State Mutual Life
The New England
Philadelphia American Life
Confederation of America
Provident

With the LifeCard provider network, you get instant verification that your claim has been received. In addition, you save time by avoiding the aggravation of complicated follow-up.

ADD A SPECIALIST TO YOUR STAFF... BUT NOT TO YOUR PAYROLL.

MULTI-PRO 2.2 specializes in medical practice management.

Developed and offered exclusively by ANTEK, suppliers of quality computer systems and services, the MULTI-PRO 2.2 system is designed especially for use by the private medical sector.

MULTI-PRO 2.2 employs state of the art programming technology to dramatically accelerate routine billing and related procedures. The system prepares patient statements, easily handles complex primary and secondary insurance billing, follows up on delinquent accounts to assure cashflow and makes information you need available when you need it, at the touch of a key.

When you add MULTI-PRO to your staff, you take a giant step toward making your practice...perfect.

WANTED

Patriotic Physician to join
MARYLAND AIR NATIONAL GUARD
to protect the health of those who help to protect you.

Contact Salvatore J. DeMarco III, M.D. (301) 659-7222 for information.

We Guard America's Skies.

Listen to your peers. They tell us

THE MEDICAL MANAGER® Is Peerless!

For years we've been telling you that The Medical Manager® from PRISM Medical Systems is the best software for your medical practice. Now it's time for some of our users, physicians and office managers, to tell you.

"We have found that PRISM understands medical office function better than other vendors we spoke to. PRISM best met our needs with hardware and software and training. I really appreciate being able to call and talk about our problems, no matter how simple or complex."

—Northern Virginia Pulmonary Associates

"We felt that the increased flexibility and versatility of The Medical Manager® would provide us with a system that would grow along with us and adapt to the demands of our practice. No other system we looked at was able to monitor the multiple and changing components of our practice as effectively and detailed as The Medical Manager.® The enhanced scheduling program will be a life saver for us, with our complex assortment of patients and practitioners."

—Scandia Centrum

PRISM Medical Systems is the largest dealer of The Medical Manager® in the Mid-Atlantic states. Users agree that this medical practice management software package streamlines office organization and improves collections. With more than 8,000 systems installed nationwide, The Medical Manager® surpasses its competition. Satisfied users agree.

For more information about The Medical Manager® contact your nearest PRISM office or call us toll free.

Executive Director's Newsletter

August 1990

October Drug Conference

Attached to the cover of this *MMJ* is a brochure on "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician," a seminar dealing with the problems associated with alcoholism and drug addiction. Med Chi encourages all Maryland physicians to attend this seminar on Saturday, October 20, and Sunday, October 21, 1990 at the Baltimore Convention Center on 1 East Pratt Street. Med Chi designates 12 Category I CME credits for this seminar, and it is acceptable for 12 prescribed hours by the American Academy of Family Physicians. To register for the seminar fill out the application on the back cover. For more information contact Michael Llufrio at 301-539-0872 or toll free at 1-800-492-1056.

Med Chi Semiannual Meeting

Med Chi encourages all Maryland physicians to attend its Semiannual Meeting on September 13-15, 1990 at the Royal Princess Ocean Suite Hotel in Ocean City. Please note in the revised preliminary program following this newsletter that Council will meet on **Friday, September 14 at 1:15 p.m.** Med Chi made this change to simplify travel plans for physicians required to attend the Council and House of Delegates meetings. Additionally, the symposium on the "Maryland Access to Care Program" will be on Thursday, September 13 at 1:15 p.m. Sidney Schnoll MD, PhD will speak on "New Directions in Continuing Medical Education on Substance Abuse" during the workshop on Saturday, September 15 at 9 a.m. Recently, Med Chi invited Gail Wilensky PhD, Director of the Health Care Financing Administration, and Robert McAffe MD from the AMA Board of Trustees to speak during the meeting. Updates on the program will appear in the September edition of this newsletter.

Maryland Physician License Renewals

The Board of Physician Quality Assurance is conducting its biennial renewal of medical licenses in Maryland. **If your last name begins with A through L, your current license will expire on September 30, 1990. You should return your application for renewal by August 28, 1990 to assure processing by September 30th.** If you do not receive a renewal application by August 15, 1990, please contact Paul A. Roeger, Director of Physician Licensure Programs at the Board 301-764-4777.

Physician Assistants Regulations

Physicians should note that Maryland law requires physician assistants to perform only those delegated medical acts outlined in the job description submitted to the Board of Physicians Quality Assurance. "Job description means a document executed by a physician assistant and physician that has been approved under this title to permit the delegation of medical acts to a certified physician assistant" (HO.Sec.14.5-101(f)). Any physician assistant who performs medical acts (or any physician who aids that practice) not outlined within the job description is subject to disciplinary action by the Board. (HO.Sec.14-504(a)(18), Sec.14-5312(5)).

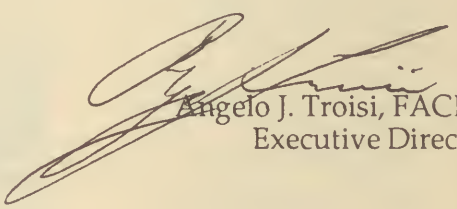
Legibility of Prescriptions

The Maryland Board of Pharmacy recently received several complaints from pharmacists regarding the legibility of prescriptions and physicians signatures. To prevent dispensing errors and reduce time-consuming calls to verify prescription information, Med Chi encourages physicians to insure that their prescriptions and signatures are clear and comprehensible.

Medicaid Patients Less Likely to Sue

According to a report from the US General Accounting Office, Medicaid recipients are less likely to sue physicians than are other patients. The GAO report indicates that 5.8 percent of claims for which insurance coverage is applicable sue, compared to 9 percent of the US population. This suggests that low-income patients are less likely to sue. Although the study is not clear in showing the degree to which rates of suit vary among institutionalized and noninstitutionalized Medicaid recipients, it does indicate that large number of Medicaid recipients are elderly nursing home residents who are less likely than the general population to sue.

Medicare Physician Regulation Relief



Med Chi recently sent letters to all Maryland U.S. Congressional representatives supporting H.R. 4475, "Medicare Physician Regulation Relief Amendments of 1990," in an effort to alleviate the burden of compliance with excessive Medicare regulations. If passed this legislation would:

- Provide physicians with more complete information on Medicare utilization review policies. If physicians are subject to penalties it is only fair that they be provided with advance knowledge of payment limits.
- Allow physicians to continue long-standing reciprocal agreements whereby a colleague cares for patients when the attending physician is not available.
- Amend Medicare reconsideration and appeal rules to allow state medical societies or other professional organizations to appeal payment denials on behalf of an entire class of physicians.
- Establish a physician advisory group to review Medicare Part B policy, requirement, and Medicare carrier implementation issues.
- Prohibit Medicare carriers from charging physicians for information necessary for compliance with Medicare law and regulations.

As of June 25, 1990 Representatives Roy Dyson and Constance A. Morella are the only confirmed cosponsors of this bill from Maryland. Med Chi urges all physicians to write to their representatives and request their cosponsorship for H.R. 4475. For more information regarding H.R. 4475 contact Betsy Newman in Med Chi's Public Relations Department at 301-539-0872 or toll free at 1-800-492-1056.

New AMA Executive Vice-President

On June 19, 1990 James S. Todd MD became the Executive Vice-President of the AMA. Dr. Todd has been the AMA's Acting Executive Vice-President since February 1990 after serving as Senior Deputy Vice-President since 1985. Dr. Todd was a member of the AMA Board of Trustees from 1980 to 1984 and served as Commissioner to the Joint Commission on Accreditation of Hospitals from 1982 to 1985. John J. Ring MD, Chairman of the AMA Board of Trustees remarked on Dr. Todd's appointment saying, "Dr. Todd is a superb administrator as well as an excellent advocate for physicians and their patients on Capitol Hill."

Semiannual Meeting

Medical and Chirurgical Faculty of Maryland

September 13 - 15, 1990
Thursday - Saturday

Royal Princess Ocean Suite Hotel
Oceanfront at 91st Street
Ocean City, Maryland 21842

Revised Program

The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

1990 Semiannual Meeting

Thursday, September 13, 1990

8:00 am - 5:00 pm
Registration

9:00 am - 5:00 pm
Exhibits Open

8:15 am - 9:00 am
Opening Remarks - Reynaldo L. Lee-Llacer, M.D., President
Speaker to be announced

9:00 am - 12:15 pm
Year of the Infant Symposium
"Child Abuse: The Physician's Responsibility" - Charles Shubin, M.D., Nevett Steele, Esq., Giselle Meek, M.S.W.
Cosponsored by Medical Mutual Liability Insurance Society of Maryland with the cooperation and support of the law firm of Whiteford, Taylor and Preston

9:45 am - 10:15 am
Break (Visit Exhibits)

12:15 pm - 1:15 pm
Lunch Break

1:15 pm - 3:15 pm
Symposium
"Maryland Access to Care Program" -
Planned by the Liaison with the Medical Assistance Program
Gary Rosenberg, M.D., Mary Mussman, M.D., Nelson Sabatini

1:15 pm - 3:15 pm
Workshops
"Wellness/Preventive Health Programs that Work" -
In cooperation with BC/BS of Maryland - Speaker to be announced
"Depression: Clinical Guidelines" - In cooperation with Burroughs Wellcome - Speaker to be announced

3:15 pm - 3:45 pm
Break (Visit Exhibits)

3:45 pm - 5:45 pm
Bioethics Symposium
Planned by the Committees on Professional Ethics, Medicine and Religion
"The Right to Die: Issues and Dilemmas - Medical, Legal, Economic, Social, Ethical, Religious" - Speaker to be announced

Friday, September 14, 1990

8:00 am - 5:00 pm
Registration

8:00 am - 5:00 pm
Exhibits Open

8:45 am - 12:15 pm
Cardiovascular Forum
"Diagnosis & Treatment of LVH" - John Gottdiener, M.D., FACC, Georgetown University School of Medicine
"Current Status of Valvular Surgery" - John Moore, M.D., FACS, Medical College of Georgia
"Interventional Radiology" - Fred Osterman, M.D., Chief of the Division of Interventional Radiolgy, Johns Hopkins University School of Medicine

9:45 am - 10:15 am
Break (Visit Exhibits)

12:15 pm - 1:15 pm
Lunch Break

1:15 pm - 3:15 pm
Council Meeting

3:15 pm - 3:45 pm
Break (Visit Exhibits)

3:45 pm - 5:45 pm
Panel Presentation

"Emergency Departments: The Dilemmas of Overcrowding for the Primary Care Physician" - Moderator: Brian Browne, M.D., University of Maryland School of Medicine
In cooperation with the American College of Emergency Physicians, Maryland Chapter

Saturday, September 15, 1990

8:30 am - 12:00 pm
Registration

8:30 am - 12:00 pm
Exhibits Open

9:00 am - 12:00 pm
Workshops

"Smoking Cessation - Proven Techniques in Helping Your Patients Stop Smoking" - Kevin Ferentz, M.D., Carmine M. Valente, Ph.D.
"Challenge of Malpractice Litigation to Clinical Practice" - Donald DeVries, Esq.
"Physician Retirement: Implications for your Clinical Practice Management" - With cooperation and support from the First National Bank of Maryland - Speaker to be announced
"New Directions in Continuing Medical Education on Substance Abuse" - Sidney Schnoll, M.D., Ph.D.

12:00 pm - 1:00 pm
Lunch Break

1:00 pm - Adjournment
House of Delegates

The Medical and Chirurgical Faculty designates this continuing medical education activity for 15 credit hours in Category I of the Physicians Recognition Award of the American Medical Association. ***A Certificate of Attendance will be issued.***

About the Royal Princess: Med Chi has selected the Royal Princess for this year's Semiannual Meeting because of its all-new, state-of-the-art, meeting and exhibit facilities.

You will also find the ambience and amenities that only a first class resort can offer. Consider the following when making your reservations: a reduced suite rate @ $100 per night (no charge for children under 17) will allow you to enjoy:

* Complimentary continental breakfast
* A convenient full kitchen with microwave
* Two color televisions, with satellite programming
* In-room refreshment centers
* Fully equipped health club and indoor olympic size pool
* Your own spacious, private balcony
* Exquisite furnishings
* Two private, in-suite telephones
* Electronic room safes
* Covered parking spaces

For hotel reservations call: 1-800-63-ROYAL or 1-301-524-7777. Please identify yourself as eligible for the Med Chi special group rate. Deadline for hotel reservations is August 15, 1990.

DO YOU KNOW THE TRUTH?

ARE YOU IGNORING THE TRUTH?

ARE YOU HIDING THE TRUTH?

ARE DRUGS THE TRUTH?

Learn how to diagnose, treat, and prevent drug abuse in your patients.

Attend "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician" on Saturday and Sunday, October 20-21, 1990 at the Convention Center in Baltimore.

See the attached brochure and the article on page 719 for more information.

Medical and Chirurgical Faculty of Maryland

Physician Rehabilitation Committee

Physicians Address Drugs as a Healthcare Issue

If Family Doctors and Primary Care Physicians don't get involved, the [drug] problem will fester, proclaims Nelson Goodman MD, Chairman of the Committee on Drugs of The Medical and Chirurgical Faculty of Maryland. The Committee is sponsoring "Practical Management: Drug Abuse Education for the Primary Care Physician," a conference to be held on Saturday and Sunday, October 20-21, 1990, at the Convention Center in Baltimore. The conference will fulfill 12 CME credits in Category I of the Physician's Recognition Award of the American Medical Association. Legal, behavioral, and biological aspects of addiction will be addressed.

Dr. Goodman hopes the conference will help establish a rapport between the legal and the medical community. Alexander Williams Esq., States Attorney for Prince George's County, will speak on the "Legal Aspects of Treating the Addict: Essentials for the Primary Care Physician." Dr. Goodman comments that many officials offer more police and more jails as solutions to the drug abuse problem, but he stresses that "drug abuse is a medical problem--a psychological, physical, chemical problem." Those attending the conference should already be aware that something needs to be done but Dr. Goodman hopes the conference will teach primary care physicians how to recognize the early signs of addiction, what to do when they see a potential drug abuser, the illnesses related to drug abuse, and how to treat and refer their patients.

Noted professionals will address October's conference including Sidney Schnoll MD, PhD, Division of Substance Abuse, Medical College of Virginia, and Robert DuPont MD, former Director, National Institute on Drug Abuse. One of the first speakers will be Charles Whitfield MD who will discuss the "Early Detection and Management of the Alcoholic and Chemical-Dependent Person." Dr. Whitfield states that "physicians have traditionally not been taught about how to deal with chemical dependency; and even today they are not being taught adequately." He will discuss the questions physicians need to ask in the interview, things to look for in the evaluation and physical examination, diagnostic surveys, blood and urine testing, and the basic treatment of chemical dependence. Dr. Whitfield hopes the conference will result in physicians "making an earlier diagnosis of chemical dependence and in offering appropriate treatment, including referrals."

As well as the overall problem of drug dependency, specific drugs that are a problem will be scrutinized. Heroin, benzodiazepines, amphetamines and cocaine will be highlighted by various speakers.

Maxie Collier MD, Commissioner of Health, Baltimore City Health Department, will speak on the "Health Department as a Resource to the Primary Care Physician." Dr. Collier feels that at the present time many people treat drug abuse as a special problem. Dr. Collier wishes drug abuse would be treated like other medical problems and he hopes that physicians will "become more interested in seeing drug abuse as a primary healthcare problem."

Dr. Goodman feels that this conference is "a vital thing for the public health" and hopes that this weekend conference will be "a model for courses everywhere." Dr. Goodman and the Committee on Drugs encourage all physicians to attend this conference. A detailed brochure and registration form is attached to this issue of the *MMJ*. ■

MRI UPDATE

Figure 1

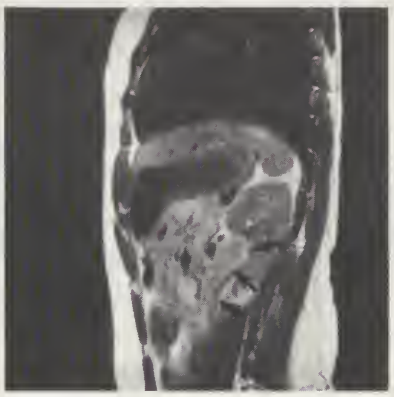

Figure 2

Figure 3

CLINICAL HISTORY: This is a 25-year-old female with complaints of left sided flank pain, nausea, and vomiting.

FINDINGS: Figure 1 represents a coronal T1-weighted image through the kidneys. A lobulated soft tissue mass conforming to the approximate shape of the left renal pelvis and the lower pole collecting system can be identified (large arrow). Signal intensity is intermediate and there is a central area of decreased signal intensity probably representing necrosis. Figure 2 is a sagittal image through the left kidney. In this projection, the soft tissue mass is comma shaped and can be identified extending from the left renal pelvis into the proximal left ureter (small arrows). Figure 3 is a T2-weighted image which exhibits increased signal intensity in the periphery of the mass and central decreased signal intensity. A curvilinear low signal structure lies medial to the mass and is felt to represent the left renal vein displaced by the mass. The vein appears to be patent as evidenced by the low signal intensity indicative of flowing blood (small arrows). No adenopathy is identified. There is no evidence of extension of the mass beyond the margins of the left renal pelvis or the proximal left ureter.

MR IMPRESSION: The location and shape of the soft tissue mass is typical for a transitional cell carcinoma.

MR NOTES: MR of the kidneys is a noninvasive procedure yielding both static and dynamic information about the pathologic process in question. In this case, the MR images defined the presence of the soft tissue mass in the left kidney, the confinement of the soft tissue mass to the left renal collecting system and the proximal left ureter, and the lack of invasion into the kidney and the adjacent pararenal soft tissue structures. In addition, the MR scan demonstrated that there is no evidence of thrombosis of the left renal vein nor is there evidence of tumor into the vein. MR imaging of the kidney is a noninvasive procedure allowing both anatomic identification of renal masses, staging of the extent of those renal masses, and determination of the presence or absence of renal vein involvement for surgical planning.

BALTIMORE, MARYLAND
Announces a Program in Phacoemulsification

Course Director: Leeds E. Katzen, M.D., F.A.C.S.
Chief, Department of Ophthalmology
Coordinator: Kathleen Molyneaux, R.N.

This intensive two-day program is designed for the surgeon who actively intends to begin performing these techniques and may or may not have had prior problems. The objective of this program is to provide the participant with the full range of knowledge and support necessary to be successful with the most current techniques of Phacoemulsification.

The Program Will Include:

- Indications and contraindications for Phacoemulsification.
- Intensive lectures with audio visual aids, by full-time and guest faculty.
- Preoperative preparation and postoperative care.
- Routine practical instruction in laboratory on surgical technique and use of the Phaco-Emulsifier.
- Capsularhexis and Hydrodisection.
- One-handed and two-handed techniques taught.
- Management of complications.
- Concentrated time for question and answers and discussion with the full time and guest faculty.

Course Dates:
October 12-13, 1990
November 16-17, 1990
1991 Dates to be Announced

Guest Faculty
To Be Announced
Tuition: $495.00
10 Hours Category 1 CME Credit

For Additional Information, contact:
Kathleen Molyneaux, R.N. • Mercy Medical Center
301 St. Paul Place • Baltimore, MD 21202 • (301) 783-5878

As an organization accredited for continuing medical education, the Mercy Hospital Center designates this continuing medical activity as meeting the criteria for 10 credit hours in Category 1 of the Physician's Recognition Award fof the American Medical Association.

Highlights: Executive Committee and Council Actions

Council - March 15, 1990
382nd Meeting

Minutes The Council minutes of January 18, 1990 were adopted as amended. The Executive Committee minutes of December 21, 1989 were adopted.

Committee on AIDS The Committee's report of its December 20, 1989 meeting and its January 15, 1990 meeting were submitted for Council's approval. Having no recommendations, the reports were approved as submitted.

Dr. Michael R. Dobridge motioned to forward the AMA's Board of Trustees Report X to the Committee on Aids for its review and report to the Council. The motion was seconded and approved.

Committee on Professional Ethics Dr. Louis C. Breschi presented the Committee's report of January 9, 1990, which was approved as submitted. Dr. Breschi also presented a request for approval of Ethical Opinion 409, "Responsibility of Physician to Patient as Affected by Contractual Agreements" as follows:

> A PHYSICIAN WHO HAS A CONTRACTUAL AGREEMENT TO TREAT PATIENTS CONTINUES TO HAVE THE PATIENT AS HIS PRIMARY CONCERN, REGARDLESS OF THE PHYSICIAN'S SOURCE OF COMPENSATION. IF A CONFLICT OCCURS BETWEEN THE PATIENT'S WELL BEING AND THAT OF THE CONTRACTING AGENT, THE PHYSICIAN MUST DECIDE IN FAVOR OF THE PATIENT.

After discussion, the Council adopted a motion to approve the ethical opinion as presented.

Committee on Specialist Identification Dr. Jose M. Yosuico, speaking on behalf of the Committee Chairman, Dr. Joseph I. Berman, presented the Committee's recommendations. The recommendations were acted upon as follows:

1. Authorization was granted to the Committee to develop a manuscript on Specialist Identification.
2. Request to accept the offer from Blue Cross and Blue Shield of Maryland to provide in-kind services for development of necessary data was extracted and referred to the Executive Committee for its review and consideration.
3. Request for authorization for two Committee members to represent the Faculty in ongoing discussions with the Board of Physician Quality Assurance regarding Specialist Identification regulations was not favorably considered. Med Chi presently is represented at the Board of Physician Quality Assurance meetings.

Peer Review Management Committee Dr. Christopher M. Harvey, Chairman, was present to report and submit the Committee's recommendations to Council and the following was concluded:

1. Following much discussion, the request for approval of the draft proposal on a Medical Education Program was referred to the Executive Committee for further investigation.
2. Authorization was granted for the expenditure of funds up to $2,000.00 to allow formal publication of the *Peer Review Handbook*, and also that the expenditure be taken out of reserves and placed into the operating budget to accomplish the publication.
3. Establishment of a Physician Grievance Committee to review non-chargeable cases through a mechanism providing immunity to the reviewers involved. Following discussion, it was moved to assign the Physician/Patient Relations Committee the responsibility of reviewing non-chargeable cases and to invite the Legislative Committee to review the issue concerning providing immunity to the reviewers involved, rather than forming another individual committee. The motion was seconded and approved.

Liaison Committee With The Medical Assistance Program Dr. Gary L. Rosenberg, Chairman, was present to submit the "Proposed Medicaid Open Enrollment Plan" to Council for its consideration.

Dr. Rosenberg explained that the plan will: link Medical Assistance patients with Primary Care Providers (PCPs); require prior approval from PCPs for access to specialty care, admission to a hospital, and non-urgent use of emergency departments; and provide increased reimbursement to physicians that will amount to approximately a 50 percent increase across the board.

Following discussion, the Council adopted a motion to approve the plan in concept, and to continue to work with the Department of Health and Mental Hygiene in order that Med Chi may have input into the development of the regulations of the proposed case management system.

The Committee's report of January 17, 1990 was submitted for Council's approval. Having no recommendations, the report was approved as submitted.

Legislative Update Gerard Evans, from the law firm of Rifkin, Evans, Silver, and Lamone, introduced Jean Fugett, who will be joining the firm as of-counsel. Fugett, a former professional football player, will concentrate on adding to the firm's corporate law practice. Fugett has aided and will continue to aid the firm in lobbying as well. Fugett has a separate company through which he represents athletes, broadcasters, and entertainers in contract and employment matters.

Mr. Evans also spoke about the recent defeat (17-6) in the House Environmental Matters Committee of Mandated Medicare Assignment. This year marked the fourth consecutive year Mandated Assignment has been defeated. Mr. Evans noted that the testimony of three Past Presidents and the current President of Med Chi was instrumental in having the bill overthrown. He also pointed out that AARP (American Association of Retired Persons) had opposed the bill because of its imposition of a means test.

House Bill 1248, prepared by the Health Services Cost Review Commission, was also defeated by the same Committee. The primary purpose of the bill was to regulate the practice activities of radiologists, anesthesiologists, and pathologists (RAPs). Mr. Evans commended all of the physicians who testified at the hearing.

Mr. Evans commented on the physician ownership bills and referral bills circulating in the House and Senate. Med Chi is supporting SB 585, which is predominately a disclosure bill requiring physicians to inform patients of financial interests in healthcare facilities/operations. Med Chi will continue to oppose HB 779 which passed, with amendments, the House Environmental Matters Committee (16-6). This bill prohibits physicians from referring patients to healthcare services in which physicians or their immediate families have a significant financial interest.

Mr. Evans spoke about the abortion filibuster which is still ongoing as of this date. He indicated that Med Chi had testified on one bill relating to the regulation of physicians performing abortions (SB 356). He stated that he had been asked to do so by two of the committee chairmen.

On a final note, Mr. Evans addressed the triplicate prescription bill as it was heard in the Senate Economic and Environmental Affairs Committee on March 13. Opponents of the bill included representatives of Med Chi, the Maryland Pharmacist Association, Maryland Blue Cross and Blue Shield, the Maryland Dental Society, the American Cancer Society, the National Institute of Drug Abuse (NIDA), and two physicians from the New York State Medical Society where triplicate prescriptions are in operation. It is uncertain when a vote on this will be taken because the Governor is expected to issue an executive order negating the need for such a bill.

PRO Monitoring Committee Dr. John A. Singer, Chairman, presented the recommendations contained in the Committee's report of February 6, 1990, as follows:

1. Request for approval to send appropriate communication to physician chairmen of hospital utilization review committees encouraging notification to Med Chi of any "quality letter" problems.

Council Action: Approved and referred to the Executive Committee, with direction to staff that a draft letter be prepared and submitted to the Executive Committee for consideration.

2. Request that the Faculty inform Dr. R. Lane Wroth, Delmarva Foundation for Medical Care (DFMC), that his signature as the regional medical director, misleadingly reflects that he is involved in the review of the "Quality Concern Inquiries," and recommended that the DFMC clarify this issue in its letters to physicians.

Council Action: Approved and referred to the Executive Committee, with direction to staff to prepare a draft letter for the Executive Committee's consideration.

3. Recommendation that the Faculty go on record as strongly opposing physician office-based review, and that in any future discussions with DFMC regarding office-based review, the PRO Monitoring Committee should be represented.

No Action Required: Mr. Troisi informed the Council that Med Chi's position was already established as opposing physician office-based review and this information has been forwarded to DFMC, along with a copy of the AMA's report.

Committee on Hospital Medical Staffs A tabled motion from the Council meeting of January 18, 1990 was placed on the floor for discussion. The motion regarded appointments to fill Med Chi positions on the Board of Directors of the Healthcare Credentials Verification, Inc. The nominees on the tabled motion included:

Joseph S. Fastow MD
Calvert County - Calvert Memorial Hospital
Leslie R. Miles, Jr. MD
Allegany County - Sacred Heart Hospital
Marvin Schneider MD
Montgomery County - Holy Cross Hospital
Joseph I. Berman MD
Baltimore City - Columbia/FreeState
Robert J. Mahon MD
Baltimore County - St. Joseph Hospital
Paul A. Stagg MD
Dorchester County - Eastern Shore Hospital Center

Following the introduction of the tabled motion, Dr. Raymond M. Atkins, President, offered a substitute motion which included the following nominees:

Marvin Schneider MD
Rafael C. Haciski MD
Abdolhamid Ghiladi MD
Paul A. Stagg MD
Joseph S. Fastow MD
Raymond M. Atkins MD

The substitute motion was adopted, followed by a motion to reconsider, which was approved. Discussion took place and nominations were made from the floor. Dr. Breschi nominated Francisco Reyes MD to represent Western Maryland, which was seconded and approved. Dr. Fink nominated J. Richard Lilly MD to represent Prince George's County, which was also seconded and approved. Following these two nominations, the nominations were closed. The question was raised as to whether all of the nominees had been contacted and asked to serve; staff responded that they had. The Chairman then requested staff to organize ballots for a vote to decide Med Chi's representation on the Board of Directors of the Healthcare Credentials Verification, Inc. and named Dr. Vincent D. Fitzpatrick and Dr. Harold B. Bob as tellers. The following physicians were elected to the Board:

Joseph S. Fastow MD, *Calvert County*
Abdolhamid Ghiladi MD, *Baltimore County*
J. Richard Lilly MD, *Prince George's County*
Francisco Reyes MD, *Allegany County*
Marvin Schneider MD, *Montgomery County*
Paul A. Stagg MD, *Dorchester County*

Committee on Specialty Societies The Committee's

report of January 18, 1990 was submitted to Council with the following recommendations:

1. That David B. Posner MD be welcomed to the House of Delegates as a Delegate selected by the Committee on Specialty Societies.
2. That Drs. Jesse M. Hellman, William R. Leahy, Robert A. Liss and David C. Moses be welcomed to the House of Delegates as Alternate Delegates selected by the Committee on Specialty Societies.
3. That the Executive Committee *not* respond positively to the Algology letter, dated October 18, 1989. No response is recommended.

All of the aforementioned recommendations were approved as submitted.

Occupational Health Committee Dr. Michael K. Spodak, Chairman, presented the Committee's recommendation for Council's approval of a proposed change to the state code regulations regarding Workers' Compensation, Art. 101, Section 37 (a) as follows:

> IN THE EVENT OF A REQUEST FOR PROPOSED MEDICAL TREATMENT OF AN INJURED WORKER, THE INSURANCE CARRIER SHALL DECIDE ON THE PAYMENT OF TREATMENT WITHIN (3) WEEKS OR LOSE THE RIGHT TO DENY PAYMENT FOR SUCH TREATMENT. IN THE EVENT THE INSURANCE CARRIER DENIES PAYMENT FOR SUCH TREATMENT, THE COMMISSION SHALL ADJUDICATE THE DISPUTE WITHIN TWO (2) WEEKS.

The Committee also recommended that this proposal be referred to Med Chi's law firm for further action. Following discussion, the Committee's recommendations were approved, in principle, by the Council and referred to the Executive Committee for further consideration.

Long-Term Care and Geriatrics Committee Dr. George Taler, Chairman, presented the Committee's recommendation to establish a statewide consensus on the minimum standards of care in nursing home medicine as it pertains to the admission history and physical; periodic (annual) health appraisal; and the 30-day re-evaluation. A questionnaire has been developed and will be mailed to all Medical Directors or their designated alternates, and other interested physicians will be solicited (approximately 500 persons). After tabulation of the results of the initial survey, a re-edited and more focused questionnaire will be distributed for the final solicitation for elements which will comprise the consensus on minimum standards. Data entry programs and entry screens will be developed free of charge through the Department of Family Medicine, University of Maryland School of Medicine. Statistical analysis will also be made available at a discounted rate. Final editing of the report and submission for publication will be done by the Committee. Following discussion, the Council voted to refer this matter to the Executive Committee for further discussion and investigation.

Committee on Scientific Activity The Committee reported that due to insufficient numbers preregistered for the Semiannual meeting in Bermuda, the following recommendations be approved:

1. That the Bermuda trip and any attempts to meet in Ocean City or any other place be put aside and that Council and the House of Delegates meet in Osler Hall without a scientific program at this 1990 Semiannual meeting.
2. That there be a raffle to raffle off two tickets for a Bermuda vacation to comply with the requirements of the Southampton Princess Hotel contract.

Much discussion took place followed by the decision to cancel the Bermuda Semiannual meeting and to raffle off two tickets for a Bermuda vacation so as to comply with the hotel contract requirements. The Council directed staff to plan for the Semiannual business and scientific meeting in Ocean City, provided that the dates do not conflict with the dates of the Bermuda trip, scheduled for September 5-9, 1990.

Emeritus Members Council approved the following physicians for Emeritus Membership in the Faculty as requested by the component society indicated:

Baltimore City
Heinrich J. Losemann, *Baltimore*
Barnett Berman, *Baltimore*
Charles J. Blazek, *Baltimore*
George Dendrinos, *Baltimore*
D. Crosby Greene, *Baltimore*
K. A. Peter Van Berkum, *Baltimore*

Harford County
Charles J. Foley, *Havre De Grace*

Howard County
Otto C. Beyer, *Ellicott City*

Montgomery County
W. Luther Hall, *Chevy Chase*
Mario Mendoza, *Cortland, NY*
Frederick Moomau, *Olney*

Prince George's County
Albert J. Fisher, *Rockville*
Kevin G. Barry, *Davidsonville*

Affiliate Member
Ming K. Liu, *Ft. Washington*

These names will be presented to the House of Delegates for consideration at its 1990 Annual Session.

Dues Waiver Council approved the following physicians for dues waiver as requested by the indicated component society:

Baltimore City
Violet H. Jiji, *Baltimore*

Montgomery County
John H. Bouma, *Kensington*

White Papers Draft copies of "white papers" on "Peer Review Management Committee" and "Teen Pregnancy and Infant Mortality" were distributed to

Council for consideration of approval. The Council, after minor amendments and the deletion of Recommendation #3 of the "Peer Review Management Committee" paper, adopted both white papers as the Faculty's positions.

State Board of Examiners of Nursing Home Administrators Nominees Approval of nominees for consideration for two positions on the State Board of Examiners of Nursing Home Administrators - one "nursing home administrator" member and one "related profession" member for a three-year term were submitted to Council for consideration. Nominees submitted were:

Stuart J. Turkewitz MD, (Internal Medicine)
Prince George's County

Nominations from the floor were:

George Taler MD, (Family Practice)
Baltimore City

These names were approved and will be submitted to the Secretary of Health, Department of Health and Mental Hygiene, for consideration.

Treasurer's Report Dr. Jose M. Yosuico, Treasurer, submitted his recommendation to approve Nadan Lean, CPAs, as Med Chi's auditors (in accordance with Section II, Article 7 of the Faculty Bylaws). Dr. Yosuico pointed out that these are the same auditors used in the past, they have simply changed their name. After a brief discussion, the recommendation was approved.

Auxiliary Report Mr. Troisi informed the Council that Mrs. Vicki Cameron, President, was unable to attend the Council meeting due to an illness. She will present the Auxiliary report at the Annual Meeting. Dr. Reynaldo Lee-Llacer, as a member of the Auxiliary, invited the members of Council to an Auxiliary meeting taking place in his home on May 18, 1990.

■ ■ ■

Executive Committee - April 19, 1990

Peer Review Management Committee (PRMC) Dr. Ronald J. Cohen, a member of the Committee, was present to explain the Committee's recommendation for approval of the draft proposal to initiate a Medical Education Program. This recommendation was referred from Council on March 15, 1990, for further investigation by the Executive Committee. Dr. Cohen explained that the proposal consists of constructively using the information acquired through various functions; e.g., the Physician Rehabilitation Committee, Peer Review Committee, etc., to assist those doctors in obtaining the help they need to rehabilitate themselves.

Questions were raised in regard to the immunity of the preceptors providing help. Counsel stated that as long as this project is clearly stated as being part of the Peer Review process, they should be covered by the same policy as Peer Reviewers. Point was made referring to the objection of the verbiage in the introduction of the proposal raised by Council. Dr. Cohen was directed by the President to contact those members of Council and discuss this issue resulting in either changes in or elimination of the introduction. Following discussion, motion was made to approve the proposed Medical Education Program for a trial period of one year. The motion was seconded and approved.

Long-Term Care and Geriatrics Committee The Committee's proposal to establish a statewide consensus on the minimum standards of care in nursing home medicine as it pertains to admission history and physical; periodic (annual) health appraisal; and the 30-day re-evaluation, was referred from Council, March 15, 1990, to the Executive Committee for further discussion and investigation. Dr. George Taler, Chairman, provided further details. Executive Committee members voiced their support of the survey and the question was raised regarding the end results of the survey. Dr. Taler responded that there are two objectives to be accomplished through the survey: (1) publishing the results in the *MMJ* and (2) establishing a "voluntary" model of standards to be used in nursing homes throughout the state. This will be done after the standards are presented to the Council for acceptance and appropriate action. A motion was made approving allocation of reserve funds (up to $2,200) in accordance with the Council's action to approve this in concept and for further implementation by the Executive Committee. Motion was seconded and approved.

Committee on Physician Rehabilitation The Committee, in its report of February 23, 1990, requested approval of a pamphlet *To Disclose or Not to Disclose.* The pamphlet will be used as a guide for the impaired physicians and will be printed and provided to incumbents and all other interested parties. The Executive Committee approved the Committee's request, with funding to come from the Physician Rehabilitation Program.

The Committee's report of March 30, 1990, was also presented to the Executive Committee and contained the following recommendations:

- That loans to persons deceased, bankrupt, or unable to pay due to disability be written off for accounting purposes as uncollectible.
- That the Executive Committee excuse bad debt cases #4, 5, 6, 7, 8 and 9 (listed in the Committee's report) and consider these accounts as uncollectible.

Following discussion, the recommendations were

approved as submitted. The report of the financial status of the Physician Rehabilitation Program was also accepted as submitted.

Committee on AIDS The Committee's report of March 14, 1990 was presented to the Executive Committee and the following action was taken on the recommendations contained in the report.

- The request to take a position urging the DHMH to increase Medical Assistance reimbursement for physicians who treat AIDS and HIV patients was disapproved.
- Permission was not favorably considered for the Committee on AIDS to hold an open meeting during the 1990 Annual Meeting to discuss increased Medical Assistance reimbursement.

Hospital Medical Staffs Committee The Committee report of March 20, 1990 contained two recommendations which were acted upon as follows:

- *Springfield Hospital Center* - Recommendation that the Executive Committee grant permission to have the hospital medical staff discuss this matter during the HMSS portion of the annual meeting of the AMA. Following discussion, a motion was made to approve the recommendation as being in accordance with Council's original decision to support the medical staff of the hospital. The motion was seconded and approved.
- *Liaison to the Healthcare Credentials Verification, Inc.* (HCV) - Recommendation that the Executive Committee allow the Hospital Medical Staffs Committee to be the liaison/oversight committee to the HCV. Recommendation was approved as submitted.

PRO Monitoring Committee Recommendations referred from Council on March 15, 1990 for Executive Committee's consideration:

- Draft letter to be sent to physician chairmen of hospital utilization review committees requesting that Med Chi be notified of any "quality letter" problems. Motion to approve was adopted.
- Draft letter to be sent to R. Lane Wroth MD, Medical Director, Delmarva Foundation for Medical Care (DFMC), requesting DFMC to clarify the role of the regional medical director whose signature appears on the letters to physicians re "quality concern inquiries." Motion to approved was adopted.

Occupational Health Committee Recommendation referred from Council on March 15, 1990 for further consideration by the Executive Committee:

The following proposed change to the state code regulations regarding Workers' Compensation (Art. 101, Section 37(a)) be referred to Med Chi's law firm for further action:

IN THE EVENT OF A REQUEST FOR PROPOSED MEDICAL TREATMENT OF AN INJURED WORKER, THE INSURANCE CARRIER SHALL DECIDE ON THE PAYMENT OF TREATMENT WITHIN (3) WEEKS OR LOSE THE RIGHT TO DENY PAYMENT FOR SUCH TREATMENT. IN THE EVENT THE INSURANCE CARRIER DENIES PAYMENT FOR SUCH TREATMENT, THE COMMISSION SHALL ADJUDICATE THE DISPUTE WITHIN (2) WEEKS.

Motion to refer to Med Chi's legal counsel for investigation was adopted.

Library and History Committee The Committee's report of March 6, 1990 was approved with the following recommendation:

- That the printing of 3000 copies of the Krause Room brochure at the cost of $578.00 be approved.

Motion to approve was adopted.

Resolution on Drug Crisis The following resolution was adopted by the Executive Committee and will be forwarded to the Council for action during its May 9, 1990 meeting:

WHEREAS, Our nation's drug crisis is taking a tragic toll on human lives, threatening every segment of our society and our healthcare system;
WHEREAS, Illicit drugs and alcohol are addictive substances that carry a high risk of abuse, can impair mental and physical functioning, and lead to illness, injury, disability and death; and
WHEREAS, Physicians can make a difference in helping to solve these problems by working together in community partnerships and applying their special skills and knowledge; therefore, be it
RESOLVED, That the Medical and Chirurgical Faculty of Maryland pledges a high priority to developing and supporting drug and alcohol abuse education and prevention programs that facilitate the participation of all physicians, and calls upon every member to devote a portion of his or her time to public service initiatives.

Young Physicians Committee The Executive Committee discussed the funding of a representative of the Young Physicians to attend the AMA's Young Physicians annual meeting in Chicago in June, 1990. After discussion, it was decided that because one of the Alternate Delegates was not able to attend, funding for the Young Physician's attendance would not be beyond the funded budget. Therefore, approval was granted for the representative Young Physician to attend the AMA meeting in June; and coach air fare, plus normal reimbursement for AMA delegates would be provided.

Bylaws Committee At its meeting of March 26, 1990, the Bylaws Committee considered a proposal from the President-elect to consider reducing the number of Med Chi committees. The Bylaws Committee recommended the matter be referred to the Policy and Planning Committee. Following discussion, a motion was adopted to refer the matter to the Policy and Planning Committee.

Resolution for the AMA, "Doctor's Day in Congress"

The following resolution was adopted by the Executive Committee for Council's approval and forwarding to the AMA. Dr. Dobridge suggested that staff determine if other states wish to join Med Chi in the submission to the AMA.

> WHEREAS, The medical profession is becoming involved in excessive regulation which is interfering with the effective delivery of quality care;
> WHEREAS, Arbitrary rules are being established by HCFA without appropriate input by the medical profession;
> WHEREAS, The physicians of the United States of America are delivering the finest quality medical care in the world; and
> WHEREAS, The Medicare Program has developed rules and regulations which are contrary to the original intent of the law; therefore, be it
> RESOLVED, That the American Medical Association provide guidelines for meetings of this type with appropriate issues to be presented to members of both the Senate and House of Representatives;
> RESOLVED, That "Doctor's Day in Congress" receive appropriate publicity as to its intent to maintain the quality of medical care being delivered to the American public; and
> RESOLVED, That this be an annual event on a specific date each year in order that we maintain our communication as a medical profession with the individual members of Congress, while demonstrating to the public, the physicians' deep and personal commitment to the health of our citizens.

Ad Hoc Committee of Specialty Society Committee The Ad Hoc Committee presented to the Executive Committee the following recommendations relative to Laparoscopic Cholecystectomy:

(a) That the Council adopt this procedure as "standard" procedure as opposed to an "experimental" procedure;
(b) That this procedure be considered appropriate as determined by individual hospital protocol;
(c) That reimbursement for this procedure be commensurate with individual physicians' fees in conjunction with their charges for the standard cholecystectomy procedure; and
(d) That the procedure be such that an assistant surgeon is appropriate and that reimbursement be made for the assistant surgeon at the standard percentage ratio.

Following discussion, the Executive Committee adopted a motion to accept recommendations (a) and (b) for Council action and to not favorably consider (c) and (d).

Nominee for AMA Women in Medicine Advisory Panel The name of Cheryl E. Winchell MD, Montgomery County, was submitted as a nominee for the AMA Women in Medicine Advisory Panel. Question was raised concerning Dr. Winchell's eligibility. Staff was directed to verify this information. Motion was seconded and adopted to support Dr. Winchell as a nominee, given she meets the necessary qualifications.

■ ■ ■

Council May 9, 1990
383rd Meeting

Minutes The Council minutes of March 15, 1990 were approved as submitted and the Executive Committee minutes of April 19, 1990 were accepted by the Council.

Committee on Scientific Activity Dr. Jack Zimmerman, Chairman of the Committee, reported on the Committee's recommendation to hold the 1990 Semiannual Meeting at either the Sheraton (available date, Monday through Wednesday, October 15-17, 1990) or the Royal Princess (available date, Wednesday through Friday, September 12-14, 1990) in Ocean City.

During the discussion, several members of the Council expressed their displeasure with meeting dates scheduled for Monday through Wednesday, preferring a Wednesday through Friday or Thursday through Saturday time frame. Dr. Francisco Japzon, Washington County, reminded the Council that Washington County was willing to host such a meeting. After a lengthy discussion, the Council reaffirmed its position to schedule the meeting in Ocean City and decided to refer the matter back to the Committee on Scientific Activity to select the best available site to hold the 1990 Semiannual Session, and further to refer the matter to the Executive Committee for a decision.

The Council approved the University of Maryland at College Park, Maryland, as the site for the 1991 Annual Meeting, Wednesday, May 8 through Friday, May 10. During the discussion, it was pointed out that Turf Valley had informed Med Chi it will increase its fee to an additional $1,000 per day in 1991, for a total of $24,000 for our 4-day meeting. Once again, the lack of overnight sleeping accommodations was cited as the reason for the high meeting-room rental.

Emeritus Members The following physicians were approved by the Council for Emeritus Membership in the Faculty:

Baltimore City
Virginia Ling MD, *Baltimore*

Frederick County
Adel Demiray MD, *Frederick*

Wicomico County
David W. Shave MD, *Salisbury*

Worcester County
Charles W. Trader MD, *Pocomoke City*

Affiliate Member
Lionel Lee MD, *Carmichael, CA*

These names will be presented to the House of Delegates meeting today with a recommendation for approval.

Resolution on Drug Crisis Dr. Nagel, Chairman, informed the Council that the AMA had recommended that each state society adopt a resolution on

the drug crisis, and that the Executive Committee had forwarded the resolution to the Council with a recommendation for approval. A motion by Dr. Thomas Allen to amend the resolution on line 15, following the words "...and prevention" by inserting the words "and treatment" was adopted. This was followed by an adoption of the resolution as amended, as follows: (see Executive Committee Minutes, page 727.)

"Doctor's Day" Resolution Following discussion, the Council adopted the following resolution as recommended by the Executive Committee: (see Executive Committee Minutes, page 728.)

This resolution will be forwarded to the AMA for consideration by the House of Delegates at its June, 1990 meeting in Chicago.

Laparoscopic Cholecystectomy Dr. Atkins, President, reviewed the deliberations of the Ad Hoc Committee of the Committee on Specialty Societies and recommended that the Council approve the Committee's recommendation that the surgical procedure of laparoscopic cholecystectomy be considered as a "standard" procedure as opposed to an "experimental" procedure. The concern was expressed by some members of Council as to whether Med Chi or Specialty Societies should take positions on scientific issues. Dr. Nagel explained that Blue Cross/Blue Shield's Medicare office had asked for Med Chi's advice on this issue. Dr. Breschi, Chairman of the Committee on Specialty Societies, explained that the decision in this case was made by the specialty society representative of the Maryland Chapter of the American College of Surgeons who serves on the Committee and thereby was made by the appropriate specialty. The Council accepted the report on Specialty Societies as endorsed by the Executive Committee.

H.R. 4475 - Medicare Physician Regulation Relief Amendments of 1990 Dr. Marvin Schneider reported on a letter he received from Congressman J. Roy Rowland requesting support for H.R. 4475. After some discussion concerning these proposed changes in the Medicare law, it was decided to support this piece of legislation in keeping with the position of the AMA.

Dr. Nagel thanked the Council members for their support during his tenure as Chairman.

■ ■ ■

Council - May 11, 1990
384th Meeting

Introduction of New Council Members Dr. Lee-Llacer called the names of the following new members of the Council:

Esther Edery MD, *Baltimore County*
Joseph H. Hooper MD, *Baltimore City*
Allan D. Jensen MD, *Baltimore City*
Hilary T. O'Herlihy MD, *Anne Arundel County*
Arthur L. Rudo MD, *Carroll County*

Those present were welcomed with applause by the Council.

Election of Chairman and Vice Chairman The President called for nominations from the floor for the position of Chairman. Dr. Jose Yosuico nominated Dr. Marvin Schneider, the nominations were declared closed, and Dr. Schneider was elected unanimously to the position of Chairman of the Council.

Dr. Schneider presided as Chairman of the Council and called for nominations from the floor for the position of Vice Chairman. Dr. George Malouf nominated Dr. Gary L. Rosenberg, the nominations were declared closed, and Dr. Rosenberg was elected unanimously to the position of Vice Chairman of the Council.

Faculty Legal Defense Fund Dr. Schneider, Council Chairman, briefed the Council on the possibility of transfering existing funds to MMPAC for use in legislative districts in which there is a good chance to support either an incumbent legislator or other person running for a seat in the November 1990 election. Dr. Nagel moved, and it was adopted, that the Council allow the Executive Committee to respond to such requests as determined by a specific plan for each legislative district in which an opportunity to effect a positive change may be possible. ■

ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

MARYLAND DIAGNOSTIC IMAGING CENTER

7120 Contee Road
Laurel, Maryland 20707

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

Gary L. Rosenberg
Marvin Schneider
Joseph Snyder
Marvin N. Tabb
Jeffrey F. Witte
Jose M. Yosuico

Past Presidents
DeWitt E. DeLawter
Michael R. Dobridge
Arthur T. Keefe, Jr.

Also present were members of the Faculty staff.

Invocation

Dr. Leslie R. Miles, Jr., Chairman of the Committee on Medicine and Religion, delivered the invocation.

Guests

The President introduced the following guests to the members of the House:

Dr. Lonnie R. Bristow, Member of the AMA Board of Trustees
Nancy Kintzel, AMA's Field Representative to Maryland
Dr. Constantine Amores, West Virginia State Medical Association

Staff member Lois Spears received a bouquet of roses and a brass clock plaque in recognition of her 17 years of service as Med Chi Administrative Coordinator.

Retirement

Lois Spears, Administrative Coordinator, who will retire from the Faculty on June 1, 1990, was honored by the members of the House in recognition for her many years of dedicated service to the Faculty.

President's Remarks

The President addressed the House and expressed his appreciation for the privilege of serving as President.

Minutes Approved

The minutes of the Semiannual Session of the House of Delegates, Saturday, September 14, 1989, having been distributed to all members and corrected and approved by the Executive Committee, were approved by the House of Delegates.

Necrology

The members of the House of Delegates rose in respect for deceased colleagues as the Secretary read the following necrology:

Memorial Resolution

On motions of the Secretary, the following resolutions were adopted unanimously by the House, each on a separate division vote:

W. BRADLEY KING, JR. MD
1925 - 1989

Whereas, W. Bradley King, Jr. MD, was born in Juneau, Alaska, in 1925, and received his medical degree from Stanford, where he later won the distinguished Schilling Fellowship awarded by the school's Department of Pathology. He served his residency in pathology at the Harbor/UCLA Medical Center in Los Angeles and at Massachusetts General Hospital;

Whereas, He was co-founder of Maryland Medical Laboratory, Inc., and served as Howard County General's Laboratory Director and Pathology Chief for 11 years until his death;

Whereas, He thereafter moved to Maryland in 1959, and became an Instructor at the Johns Hopkins University School of Hygiene and Public Health and an Assistant Professor of Forensic Pathology at the University of Maryland School of Medicine;

Whereas, Dr. King worked as an Assistant State Medical Examiner from 1959 until 1961, when he was appointed Laboratory Director and Pathology Chief at Maryland General Hospital in Baltimore, where he worked for 17 years, and also was the Assistant Medical Director of the Baltimore Chapter of the American Red Cross;

Whereas, While in Boston, he was awarded a two-year research fellowship by the American Cancer Society to continue his work in clinical pathology at Massachusetts General;

Whereas, he was board-certified in anatomic and clinical pathology as well as forensic pathology. Dr. King was a fellow of the College of American Pathologists, the American Society of Clinical Pathologists, the International Academy of Pathology and the American Academy of Forensic Sciences;

Whereas, Dr. King served as President of the Howard County Medical Society and was also active for many years in other medical associations;

Whereas, He was an inspiration to all who knew him, and will be remembered for his irrepressible wit and indomitable spirit; and

Whereas, His death will leave a void in the lives of his family, friends, and colleagues; therefore, be it

Resolved, That this House of Delegates of the Medical and Chirurgical Faculty of Maryland adopts this resolution with an expression of profound sorrow on the death of Dr. W. Bradley King, Jr.; and be it further

Resolved, That this resolution be spread upon the minutes of this meeting and a copy be sent to his wife, Mrs. Marie King, in recognition of the high esteem in which Dr. King was held and will be remembered.

TIRSO E. JOSON, JR. MD
1926 - 1990

Whereas, Dr. Tirso E. Joson, Jr., died on March 30, 1990;

Whereas, Dr. Joson was an active member of the Charles County Medical Society and served as Secretary-Treasurer in 1981, as President in 1972, and performed duties dedicating his time and effort to improving and maintaining the quality of medical care in Charles County;

Whereas, Dr. Joson was a representative of the Charles County Medical Society to the House of Delegates of the Medical and Chirurgical Faculty of Maryland in the year 1980, and during that period of time served this society most diligently;

Whereas, He specialized in Obstetrics and Gynecology and during his years of practice served as Chairman of the Obstetrics and Gynecology Department at Physicians Memorial Hospital from 1984 to 1986, and was President of the Medical Staff from 1988 to 1989, during which time he earned the respect of his subordinates and peers;

Whereas, Dr. Joson was a practicing physician in the Charles County community beginning in 1969, and during all those years he characterized himself as a hard working, dedicated and compassionate physician who was always available to his patients and cared for them in a conscientious and dedicated manner; and

Whereas, Dr. Joson was named "Physician of the Year" on March 30, 1989, at Physicians Memorial Hospital in recognition of his individual achievements as a member of the hospital's medical staff; therefore, be it

Resolved, That the House of Delegates of the Medical and Chirurgical Faculty of Maryland adopts this resolution as an expression of its deep sorrow upon the death of Dr. Tirso E. Joson, Jr.; and be it further

Resolved, That a copy of this resolution be sent to his family as a token of the esteem in which he was held by all.

Fifty-Y ear Members

Presentation of Fifty-Year certificates and pins by the President to the following members took place, with the awards being mailed to those unable to attend:

Baltimore County
Harold H. Burns MD

Baltimore City
Ruth Finkelstein MD
William R. Lumpkin MD
Richard N. Tillman MD
Irvin P. Klemkowski MD
John M. Scott MD
Kennard L. Yaffe MD

Dorchester County
Lawrence Maryanov MD

President Raymond M. Atkins, MD congratulates a 50-year member for his years of dedicated service to the Faculty.

Garrett County
Andrew E. Mance

Frederick County
Bernard O. Thomas, Jr. MD

Montgomery County
George D. Selby MD

AMA-ERF Checks

Checks in the amount of $13,726 in unrestricted funds and $3,676 in restricted funds were presented to Dr. H. Franklin Herlong, Associate Dean for Student Affairs of The Johns Hopkins University, School of Medicine. $3,173 in unrestricted funds and $885 in restricted funds were presented to LTC (Ret.) Peter Stavish, Special Assistant for University Affairs and Director of Admissions of the Uniformed Services University of the Health Sciences. And $23,066 in unrestricted funds and $6,053 in restricted funds were presented to Dr. John M. Dennis, Dean of the University of Maryland, School of Medicine. Mrs. Elizabeth Linhardt, Chairperson of the AMA-ERF in Maryland, and Mrs. Victoria Cameron, President of the Med-Chi Auxiliary, participated in the presentation.

A.H. Robins Award

The President presented the A. H. Robins Award for Community Service to Dr. Wayne C. Spiggle, for his outstanding contributions to the community, the state and the country in the establishment of "Allegany Health Right," a program that provides free or low cost medical care to those residents who "fall through the cracks" of the current system.

Certificates of Appreciation

The President presented Certificates of Appreciation to the following physicians for their outstanding service and dedication as chairmen of their respective committees:

Dr. Victor Hrehorovich, Chairman
Committee on Hospital Medical Staffs
Dr. Louis C. Breschi, Chairman
Committee on Professional Ethics
Dr. Herman C. Maganzini, Chairman
Committee on Public Health

Photo Contest

The President announced the winners of the Photo Contest (Color Category):

lst and 2nd Place: Dr. A. Harry Oleynick
3rd Place - Dr. David A. Paul

Student Award

The President, Dr. Atkins, announced the winner of the Award for Excellence in Organized Medicine, Jay W. Floyd, a senior from the University of Maryland Medical School. This award was established to recognize the contributions Maryland medical students make to organized medicine.

Ming K. Liu MD, Ft. Washington

Treasurer's Report

Dr. Jose M. Yosuico, Treasurer, made a brief report on the 1990 budget as adopted by Council and distributed to all members prior to the meeting.

Bylaws Committee Report

The President advised the members of the House that the "consent calendar" procedure would be used for the report of the Bylaws Committee. Following a review of the issues of the report by Dr. Karl H. Weaver, Chairman of the Bylaws Committee, Items 1 and 3 of the report were extracted for discussion.

Dr. Weaver, on behalf of the Bylaws Committee, moved adoption of bylaw amendments, Items 2, 4, 5 and 6 of the report, which were adopted unanimously, as follows:

President Raymond M. Atkins, MD and Maryland's AMA-ERF Chairperson Elizabeth Lindhardt present checks to Deans of Maryland's Medical Schools.

Item 2. Proposed Bylaw Amendment to Maryland Delegation to the AMA, Article XI, Section 6 - ADOPTED

Rationale: To establish an appropriate procedure for processing of resolutions to be forwarded to the AMA House of Delegates.

Amend Article XI, Section 6, as follows: CAPS indicate change

Section 6. (a) At least two of the Delegates and Alternates to the American Medical Association shall be nominated and elected in the same manner and at the same time as that provided for the elective officers. Their terms shall begin on January 1 of the year following their election and they shall serve for a term of three years, or until their successors are elected.

(b) RESOLUTIONS TO BE INTRODUCED INTO THE AMA HOUSE OF DELEGATES SHALL BE SUBMITTED TO THE FACULTY'S DELEGATION TO THE AMA FOR REVIEW AND SUBMISSION TO THE COUNCIL FOR REVIEW AND APPROVAL PRIOR TO THE SUBMISSION OF SUCH RESOLUTIONS TO THE AMA. IN THE EVENT THE TIMING OF COUNCIL MEETINGS PRECLUDES THIS PROCESSING, SUCH RESOLUTIONS MAY BE FORWARDED TO THE EXECUTIVE COMMITTEE FOR REVIEW AND APPROVAL PRIOR TO THE SUBMISSION TO THE AMA. IN THE EVENT THE TIMING PRECLUDES THE EXECUTIVE COMMITTEE MEETINGS, THEN THE ACTION SHALL BE TAKEN BY THE AMA DELEGATION AS TO THE SUBMISSION OF SUCH RESOLUTIONS TO THE AMA.

Item 4. Proposed Bylaw Amendment to the Peer Review Committee, Article XI, Section 23 - ADOPTED

Rationale: To define more clearly the Committee's responsibilities as they relate to the Board of Physician Quality Assurance and to conform to the law as written.

Amend Article XI, Committees, Section 23, Peer Review Committee, as follows: [ ] indicates deletion; CAPS indicate change

Section 23. A Peer Review Committee shall consist of not less than [nine] FIFTEEN members WITH AN EFFORT MADE TO REPRESENT MAJOR SPECIALTIES. One-third of the members shall be appointed annually for three-year terms by the President. THE CHAIRMAN SHALL BE DESIGNATED ANNUALLY BY THE PRESIDENT. It shall be the duty of this committee to review the practices of Maryland physicians AS REFERRED BY THE PEER REVIEW MANAGEMENT COMMITTEE UPON REQUEST OF THE STATE OF MARYLAND BOARD OF PHYSICIAN QUALITY ASSURANCE. THE COMMITTEE SHALL REVIEW THE PRACTICES OF MARYLAND PHYSICIANS [practicing] in ALL [institutions, offices, and other] locations where medical care is rendered for the purpose of evaluating the PROFESSIONAL, PHYSICAL, AND MENTAL COMPETENCY OF PHYSICIANS [appropriateness of the care rendered as well as the competency and efficiency of the physicians rendering it]. This review shall include, but not be limited to, the quality of care rendered [medications ordered, services other than physical examination provided, and quality of the physical examination given.] AND SHALL BE CONDUCTED WITHIN THE GUIDELINES SET FORTH IN THE PEER REVIEW HANDBOOK. The committee shall also be charged with the review of the quality of care rendered by those persons under the supervision of physicians, WHERE APPROPRIATE. [*Delete to end of section.*]

Item 5. Proposed Bylaw Amendment to Establish Attendance Requirements for Members of Council - ADOPTED

Rationale: To improve communications between the Council and the component societies.

Amend Article VII, Council, by adding a new Section 7, automatically redesignating subsequent sections: CAPS indicate change

SECTION 7. COUNCILORS REPRESENTING THEIR COMPONENT SOCIETIES SHALL BE REQUIRED TO ATTEND AT LEAST A MAJORITY OF THE MEETINGS OF THE COUNCIL EACH YEAR OF TENURE. IN THE EVENT A COUNCILOR HAS BEEN UNABLE TO MEET THE ATTENDANCE REQUIREMENTS AS PRESENTED IN THIS SECTION OF THE BYLAWS, THE RESPECTIVE COMPONENT SOCIETY SHALL BE ADVISED OF THE RECORD OF THEIR REPRESENTATIVE'S ATTENDANCE AND SHALL CONSIDER POSSIBLE REPLACEMENT OF THEIR COUNCILOR."

Item 6. Proposed Bylaw Amendment regarding Membership on Peer Review Management Committee - ADOPTED

Rationale: To include the Peer Review Management Committee in the appropriate sections of the bylaws as one of the committees that restricts certain categories of membership from service on the Committee.

Amend Article II, Membership, Section 2(c), as follows: CAPS indicate change

(c) Associate members shall have the right to attend and participate in General Meetings; subscribe to the *Maryland Medical Journal*; have the privileges of the building, the reading room, the use of the books and to hold such meetings in the building as meet with the approval of the Executive Committee. They shall not have the right to vote or hold office in their component societies, but may be appointed to serve on committees of the Faculty, except the Committee on Physician/Patient Relations, the Committee on Physician Rehabilitation, the Committee on Peer Review, THE PEER REVIEW MANAGEMENT COMMITTEE, and the Committee on Drugs. Those associate members who are Doctors of Medicine engaged in the clinical practice of medicine shall have the right of physician's defense.

Amend Article II, Membership, Section 4, as follows: CAPS indicate change

Section 4. Student members shall consist of those full-time students who are enrolled in an accredited medical school, and who are either domiciled or attending a medical school in Maryland, who apply for such membership on a form provided by the Executive Director. They shall have the rights accruing to associate members except that of physician's defense, provided that any Student Member of the Faculty who is a member of a component society exclusively composed of such Student Members may exercise full membership rights and duties in such component societies. Student Members may be appointed to serve on, but not as Chairman of, committees of the Faculty except the Committee on Physician/Patient Relations, the Committee on Physician Rehabilitation, the Committee on Peer Review, THE COMMITTEE ON PEER REVIEW MANAGEMENT, and the Committee on Drugs.

Amend Article XI, Committees, Section 39, as follows: CAPS indicate change

Section 39. The President, President-elect and Secretary shall be ex-officio members of all committees except the Nominating Committee and the Committee on Physician/Patient Relations, the Commmittee on Physician Rehabilitation, the Committee on Peer Review, THE COMMITTEE ON PEER REVIEW MANAGEMENT, and the Committee on Drugs.

Dr. Weaver, on behalf of the Bylaws Committee, recommended adoption of the following bylaw amendment, Item 1 of the report, which, after debate and amendment, was adopted as amended, by the required 2/3 vote:

Item 1. Proposed Bylaw Amendment to the Board of Physician Board of Quality Assurance, Article IX, Section 1 - ADOPTED AS AMENDED

Rationale: To clarify the language in the bylaws to indicate that Med Chi is responsible for the seating of 10 of the 15 members of the Board.

Amend Article IX, Section 1, as follows: [ ] indicates deletion; CAPS indicate change

Section 1. There is a Board of Physician Quality Assurance composed of fifteen active members OF WHICH TEN OF ITS MEMBERS SHALL BE PHYSICIANS RECOMMENDED BY THE FACULTY. [and] It has such powers, duties, officers and meetings as are provided from time to time by law.

Dr. Weaver, on behalf of the Bylaws Committee, recommended adoption of the following bylaw amendment, Item 3 of the report, which, after debate, was adopted by the required 2/3 vote:

Item 3. Proposed Bylaw Amendment to Committee on Drugs, Article XI, Section 7 - ADOPTED

Rationale: To include as a function of the committee the education of both physicians and patients in the area of drug-related problems.

Amend Article XI, Section 7, as follows: CAPS indicate change

Section 7. A Committee on Drugs of at least five members shall be responsible for evaluating the appropriateness of prescribing controlled dangerous drugs and shall work closely with appropriate [state and federal] GOVERNMENTAL authorities in controlling the abuse of controlled dangerous substances by physicians and be alert to legislative and regulatory proposals regarding prescription drugs, standing ready to provide expertise in this area to such agencies or groups as request it; MAY PROVIDE EDUCATIONAL MATERIAL IN THE FORM OF LECTURES AND OTHER DIDACTIC INFORMATION ON THE CURRENT KNOWLEDGE CONCERNING PRESCRIBING CONTROLLED SUBSTANCES; MAY PROVIDE SUPPORT AND ADVICE TO THE DEPARTMENT OF HEALTH AND MENTAL HYGIENE TO URGE THAT THERE ARE ADEQUATE FACILITIES AVAILABLE 24 HOURS A DAY TO TREAT ALL OF THE VICTIMS, BOTH PROFESSIONAL AND OTHERWISE, OF DRUG ABUSE AND ITS COMPLICATIONS. Its chairman and members shall be appointed ANNUALLY by the President.

Nominating Committee Report

Dr. Michael R. Dobridge, Immediate Past President and Chairman of the Nominating Committee, on behalf of the Nominating Committee, presented the following slate of officers to the House of Delegates:

President-elect (1990-1991)
J. David Nagel, Lutherville, Baltimore County
(President, 1991-92)

First Vice-President (1991)
Marvin Schneider, Wheaton, Montgomery County

Second Vice-President (1991)
Bahram Erfan, Riverdale, Prince George's County

Third Vice-President (1991)
Alex Azar, Salisbury, Wicomico County

Secretary (1991)
Harold B. Bob, Baltimore, Baltimore County

Treasurer (1991)
Lawrence H. Fink, Laurel, Montgomery County

Committee on Scientific Activity (1991-1997)
Walker L. Robinson, Baltimore, Baltimore City

Finney Fund Committee (1991-1996)
John W. Buckley, Towson, Baltimore County

Delegates to the AMA
Donald T. Lewers, Easton, Talbot County
(January 1, 1991-December 31, 1993)
George S. Malouf, Hyattsville, Prince George's County
(January 1, 1991-December 31, 1993)

Alternate Delegates to the AMA
Henry N. Wagner, Jr., Baltimore, Baltimore City
(January 1, 1991-December 31, 1993)
J. David Nagel, Lutherville, Baltimore County
(January 1, 1991-December 31, 1993)
W. David Sullivan, Baltimore City (Student)
(1990 Annual Meeting-December 31, 1992)

President Raymond M. Atkins, MD delivers his President's Report to Med Chi's House of Delegates.

Board of Physician Quality Assurance
(4-year term, 6/30/90-6/30/94)(Faculty Bylaws require that a minimum of twice the number of nominees shall be submitted as there are seats to be filled.)

R. Marshall Ackerman (ORS)
Rockville, Montgomery County
Victor R. Felipa (IM)
Cumberland, Allegany County
Kevin N. Hennessey (N)
Greenbelt, Prince George's County
John T. Lynn (ORS)
Upper Marlboro, Prince George's County
Francis C. Mayle (N)
Bethesda, Montgomery County
Cheryl E. Winchell (FP)
Gaithersburg, Montgomery County

Dr. Atkins announced that Dr. Hennessey had withdrawn his nomination to the Board of Physician Quality Assurance, thereby leaving a vacancy to be filled.

The floor was opened to further nominations for these offices.

Dr. John Strahan, Baltimore County, was nominated from the floor as a nominee for a position on the Board of Physician Quality Assurance, following which the nominations were declared closed by general consent. Dr. Marvin Schneider moved, and the motion was adopted, that the entire slate for the Board of Physician Quality Assurance be forwarded to the Governor for consideration.

The President announced that the election for these positions would take place as the first item of business on Friday, May 11, 1990, at 2:00 p.m.

The meeting was adjourned at 11:04 a.m.

HAROLD B. BOB MD, Secretary

Commitment and Service Since 1975

The *Med Chi Agency* was established by the Medical and Chirurgical Faculty in 1975 and now has over 5,000 physicians and employees as clients.

As a comprehensive insurance agency, we are able to offer a wide range of insurance and financial products. You will benefit from the many coverages available for both your professional and personal needs. You will also benefit indirectly, because Med Chi owns the *Med Chi Agency* and the earnings from its operations.

For complete information about any insurance product or service, just give us a call. We can provide the answers you seek and the solutions you need.

Guests

The President introduced the following guests who were in attendance:

Constantine Amores MD, representing the West Virginia State Medical Association
William H. Barney MD, President, Medical Society of Virginia
J. Joseph Danyo MD, President, and Gordon K. MacLeod MD, President Elect, Pennsylvania Medical Society
Ali Hameli MD, President, Medical Society of Delaware
Palma E. Formica MD, Chairman of the AMA Council on Long-Range Planning and Development

Auxiliary Report

Mrs. Victoria Cameron, Auxiliary President, made a report to the House of Delegates which will be published in the annual reports in the August 1990 issue of the *Maryland Medical Journal.*

Election of Officers

There being only one candidate for each office to be filled, by unanimous consent, the ballot was dispensed with and the following were elected by voice vote:

President-elect (1990-91)
J. David Nagel, Lutherville, Baltimore County
(President, 1991-92)

First Vice-President (1991)
Marvin Schneider, Wheaton, Montgomery County

Second Vice-President (1991)
Bahram Erfan, Riverdale, Prince George's County

Third Vice-President (1991)
Alex Azar, Salisbury, Wicomico County

Secretary (1991)
Harold B. Bob, Baltimore, Baltimore County

Treasurer (1991)
Lawrence H. Fink, Laurel, Montgomery County

Committee on Scientific Activity (1991-1997)
Walker L. Robinson, Baltimore, Baltimore City

Finney Fund Committee (1991-1996)
John W. Buckley, Towson, Baltimore County

Delegates to the AMA
Donald T. Lewers, Easton, Talbot County
(January 1, 1991-December 31, 1993)
George S. Malouf, Hyattsville, Prince George's County
(January 1, 1991-December 31, 1993)

Alternate Delegates to the AMA
Henry N. Wagner, Jr. Baltimore, Baltimore City
(January 1, 1991-December 31, 1993)
J. David Nagel, Lutherville, Baltimore County
(January 1, 1991-December 31, 1993)
W. David Sullivan, Baltimore City (Student)
(1990 Annual Meeting-December 31, 1992)

Board of Physician Quality Assurance
(Nominees to be submitted)
R. Marshall Ackerman (ORS)
Rockville, Montgomery County
Victor R. Felipa (IM)
Cumberland, Allegany County
John T. Lynn (ORS)
Upper Marlboro, Prince George's County
Francis C. Mayle (N)
Bethesda, Montgomery County
John F. Strahan (D)
Towson, Baltimore County
Cheryl E. Winchell (FP)
Gaithersburg, Montgomery County

Legislative Report

Gerard Evans, Esq., made a report on legislative activities which will be published in the August 1990, issue of the *Maryland Medical Journal.*

Slide show

The President, Dr. Atkins, presented a slide show stressing the importance of improvement in communications between the physician and patient.

Recognition

The President presented Certificates of Appreciation to the following counties in recognition of the highest percentage of increased membership:

Howard County
Prince George's County
Worcester County

MMPAC Report

Dr. Harold B. Bob, Chairman of the Maryland Medical Political Action Committee, made a report to the House of Delegates. This report will be published in the September 1990 issue of the *Maryland Medical Journal.*

President Raymond M. Atkins, MD reviews his notes during the 331st Meeting of the House of Delegates.

BPQA Report

Dr. Israel Weiner, Chairman of the Board of Physician Quality Assurance, reported on the activities of the Board of Physician Quality Assurance.

DFMC

Dr. Robert Ruderman, Prince George's County, reported on the problems encountered by physicians being reviewed by Delmarva Foundation for Medical Care, Inc. and urged Med Chi to explore the possibility of becoming the qualifier of those performing the reviews for Delmarva. Dr. Atkins stated that the issue would be taken up by the appropriate Faculty committee.

Oath of Office - Exchange of Gavel

Dr. Atkins, President, briefly addressed the House; administered the Oath of Office to Dr. Reynaldo Lee-Llacer, the incoming President; and presented Dr. Lee-Llacer with the President's Medallion, which was followed by the exchange of the gavel. Dr. Lee-Llacer presented Dr. Atkins with the Past President's Medallion and proceeded to address the House.

By unanimous consent, the President declared the meeting adjourned sine die at 3:30 p.m.

HAROLD B. BOB MD, Secretary

Important to New Physicians!

Did you buy your Malpractice Coverage from Medical Mutual Liability?

Did you request a July 1st Effective Date?

Did anyone bother to inform you that you could have saved up to 50% on your next renewal if you had simply changed your effective date of coverage to July 3rd?

As a General Insurance Broker who has specialized in Medical Malpractice coverage for over 22 years, our first responsibility is to save our physician clients as much in premium dollars as possible.

We do this by taking advantage of every rule and regulation that will benefit our clients.

For example, applying Medical Mutual's guidelines for new physicians, a General Surgeon having an effective coverage date of July 3rd rather than July 1st could save 27% of his or her premium cost over the next three and a half years. The same physician would realize a 50% savings when the policy renews in January, 1991.

If you weren't informed of this potential savings when you bought your coverage, maybe you should be dealing with us.

For additional information on this and other cost-savings tips, just complete the form below and send it to us or call our toll-free number for immediate attention.

*Based on current rules and regulations as of June, 1990.

Yes, I'm interested in learning how William C. Garrett can help meet my medical malpractice needs.

POS Physicians Office System

"With POS, you get the strength and stability of SMS, the leading provider of healthcare information systems, combined with the personalized service that you would expect only from a small company."

In today's demanding and ever changing healthcare environment, you need an information system that will help you meet business challenges and competition head-on.

SMS' Physicians Office System (POS) can give you that edge. POS is a comprehensive medical information system offering all the features required by large clinics, but designed specifically for solo and group medical practices.

- **Advanced Features.** POS capabilities go far beyond billing office functions - they also include extensive management and clinical tools, HMO support, automated appointment scheduling and physicians access to patient information residing in your hospital's system.

- **Backed By The Industry Leader.** POS system software is developed and offered by SMS, the leading provider of healthcare information systems in the U.S. and Europe. With over 20 years of experience and 10,000 physicians as clients nationwide, SMS will be around to support you not only today, but in many years to come.

- **State-Of-The-Art Hardware.** POS runs on state-of-the-art IBM hardware that is easily expandable and adaptable to future requirements. With IBM, you can be sure that your medical information system uses the best and most valued hardware in the marketplace.

But most importantly - POS is delivered with a personal touch. SMS representatives are involved with our clients from the moment they choose our system. We provide continuity by guiding them through both their training and system installation. And we are always available to answer questions and to help them accommodate new regulatory requirements.

Call us today - and learn more about the POS personal touch.

AIDS

Mr. President and Members of the House of Delegates:

The Committee on AIDS had a very productive year and was responsible for the enactment of several new Med Chi policies and programs dealing with AIDS and HIV infection, and encouraged new state laws on the disease.

In September 1989, Med Chi's Council accepted the Committee's White Paper which established a formal Faculty position on the following topics:

- Education, prevention and treatment programs
- Discrimination
- Protection of healthcare workers
- The Omnibus Bill
- Confidentiality law
- Physicians who are HIV positive
- Mandatory continuing medical education on AIDS for re-licensure of physicians
- Refusal of treatment
- Living long and living well
- Mandatory reporting
- The Committee on AIDS

This paper allowed Med Chi to take a proactive stance on several AIDS issues in the legislature and led to the establishment of new programs.

As a result of the new Faculty position on education, prevention and treatment, the Committee initiated a program, in cooperation with the Governor's Advisory Council on AIDS and the Department of Health and Mental Hygiene (DHMH), to educate students, parents, and school employees about HIV and its transmission. Letters were sent to all public and private schools in Maryland inviting them to participate. As part of the program, volunteer physicians from Med Chi and DHMH will visit schools to teach and answer questions from children and adults about AIDS and HIV. Thus far, the response from school systems has been outstanding. Several schools have requested speakers, and the Baltimore City School Board has expressed an interest in formulating a program for the 1990-1991 school year.

In January 1990, the Committee began taking measures to educate and inform physicians about the growing AIDS epidemic. The Committee is interested in establishing a comprehensive educational program for all Maryland physicians and is currently working in conjunction with the Center for Health Education, Inc., and representatives from the University of Maryland and Johns Hopkins University Hospitals to develop such a program. Committee members are also working closely with DHMH to ascertain the results of a 1989 Maryland physician survey on AIDS and HIV.

Med Chi's January *Executive Director's Newsletter* featured an announcement that encouraged physicians to learn more about participating in treatment programs for AIDS and HIV patients. It also reminded physicians that Med Chi and AMA policies state that no physician has the moral or legal right to refuse treatment of a patient within the physician's current realm of competence, solely because the individual is seropositive.

The Committee's most pronounced educational efforts appeared in the February 1990 issue of the *Maryland Medical Journal* which explored many traditional and some innovative treatment methods for AIDS and HIV-infected patients. The issue featured articles by noted experts on Pediatric AIDS, the Management of Asymptomatic HIV, and Antiviral Therapy. The Committee hopes to establish a monthly AIDS column in *MMJ* within the coming year.

In an attempt to provide further education to physicians about the disease, the Committee on AIDS was represented during the President's Eastern Regional Conference in Cambridge, Maryland in March.

At the Med Chi Annual Meeting, the Committee sponsored a session on "AIDS in the 1990s - Living Long and Living Well" which provided detailed information on the prevention of infection and the rational use of AZT and other drugs, and attempted to re-educate physicians to the critical role of co-factors in illness. The Committee also made available the Center for Disease Control's *Mortality and Morbidity Weekly Report* on AIDS from January 26, 1990. In April, Committee members discussed the possibility of requesting that next year's Annual Meeting include a plenary speaker on AIDS.

In addition to its educational efforts, the AIDS Committee took an active role in reviewing legislation and developing Faculty positions with the Legislative Committee.

Although many pieces of AIDS legislation were introduced, only House Bill 905 passed. This bill established the Maryland AIDS Insurance Assistance Program, a two-year pilot program that will provide for continuation of health insurance benefits for HIV and AIDS patients. The program will be limited to 150 persons who meet the eligibility requirements outlined in the bill. The new law also requires DHMH to submit an annual report to the Governor and the General Assembly regarding the cost effectiveness of the program.

The Committee met with representatives from the DHMH Aids Administration to discuss the problems of infectious medical waste disposal and is encouraging DHMH to develop distinct guidelines for the disposal of medical waste.

Although the Committee on AIDS has helped institute many new Med Chi policies and programs this year, there is much work left to be done. The Committee looks forward to the coming year and will strive to provide additional education to the physicians and the citizens of Maryland.

Alcoholism and Chemical Dependency

Mr. President and Members of the House of Delegates:

The Committee on Alcoholism and Chemical Dependency continued its efforts toward raising awareness concerning the dangers of alcohol and drug abuse, including smoking.

The Committee developed a white paper entitled "The Responsibility for Behavior While Under the Influence." The paper, concerned with drunk/drugged driving, was adopted by the Executive Committee and Faculty Council. The paper recognizes Chemical Dependence as a disease, supporting the concept that offenders must face the legal/social consequences of their actions. This approach allows for said consequences to be used as another tool to get the addicted individual into treatment.

During the Committee year 1989-1990, members met with Howard Richard Sampson, Director of the Alcohol and Drug Abuse Administration, to discuss areas of mutual interest and to attain common goals.

The Committee sponsored a presentation featuring "Tobacco Dependence as an Addiction" at Med Chi's Annual Meeting. The presentation, given by Jack E. Henningfield PhD, Charles D. Stegman MD, and Claude Feinstein MD, was well received.

The Committee continues to work diligently to address a wide range of concerns about substance abuse. As the year ends, the Committee is working on supporting the recognition of Addiction Medicine as a Board Certified Specialty. I wish to thank the Faculty, the Committee members and our staff for their assistance and support this past year.

Bylaws

Mr. President and Members of the House of Delegates:

The Bylaws Committee recommends the following bylaw amendments to the House of Delegates for its consideration:

1. Proposed Bylaw Amendment to the Board of Physician Quality Assurance, Article IX, Section 1

Rationale: To clarify the language in the bylaws to indicate that Med Chi is responsible for the seating of 10 of the 15 members of the Board.

Amend Article IX, Section 1, as follows: [ ] indicates deletion; CAPS indicate change.

> Section 1. There shall be a Board of Physician Quality Assurance composed of fifteen active members OF WHICH TEN OF ITS MEMBERS SHALL BE PHYSICIANS RECOMMENDED BY THE FACULTY. [and] It shall have such powers, duties, officers and meetings as are provided from time to time by law.

The Bylaws Committee recommends adoption of this proposed amendment.

2. Proposed Bylaw Amendment to Maryland Delegation to the AMA, Article XI, Section 6

Rationale: To establish an appropriate procedure for

processing of resolutions to be forwarded to the AMA House of Delegates.

Amend Article XI, Section 6, as follows: CAPS indicate change

Section 6. (a) At least two of the Delegates and Alternates to the American Medical Association shall be nominated and elected in the same manner and at the same time as that provided for the elective officers. Their terms shall begin on January 1 of the year following their election and they shall serve for a term of three years, or until their successors are elected.

(b) RESOLUTIONS TO BE INTRODUCED INTO THE AMA HOUSE OF DELEGATES SHALL BE SUBMITTED TO THE FACULTY'S DELEGATION TO THE AMA FOR REVIEW AND SUBMISSION TO THE COUNCIL FOR REVIEW AND APPROVAL PRIOR TO THE SUBMISSION OF SUCH RESOLUTIONS TO THE AMA. IN THE EVENT THE TIMING OF COUNCIL MEETINGS PRECLUDES THIS PROCESSING, SUCH RESOLUTIONS MAY BE FORWARDED TO THE EXECUTIVE COMMITTEE FOR REVIEW AND APPROVAL PRIOR TO THE SUBMISSION TO THE AMA. IN THE EVENT THE TIMING PRECLUDES THE EXECUTIVE COMMITTEE MEETINGS, THEN THE ACTION SHALL BE TAKEN BY THE AMA DELEGATION AS TO THE SUBMISSION OF SUCH RESOLUTIONS TO THE AMA.

The Bylaws Committee recommends adoption of this proposed amendment.

3. Proposed Bylaw Amendment to Committee on Drugs, Article XI, Section 7

Rationale: To include as a function of the Committee the education of both physicians and patients in the area of drug-related problems.

Amend Article XI, Section 7 as follows: CAPS indicate change; [ ] indicates deletion

Section 7. A Committee on Drugs of at least five members shall be responsible for evaluating the appropriateness of prescribing controlled dangerous drugs and shall work closely with appropriate [state and federal] GOVERNMENTAL authorities in controlling the abuse of controlled dangerous substances by physicians and be alert to legislative and regulatory proposals regarding prescription drugs, standing ready to provide expertise in this area to such agencies or groups as request it; MAY PROVIDE EDUCATIONAL MATERIAL IN THE FORM OF LECTURES AND OTHER DIDACTIC INFORMATION ON THE CURRENT KNOWLEDGE CONCERNING PRESCRIBING CONTROLLED SUBSTANCES; MAY PROVIDE SUPPORT AND ADVICE TO THE DEPARTMENT OF HEALTH AND MENTAL HYGIENE TO URGE THAT THERE ARE ADEQUATE FACILITIES AVAILABLE 24 HOURS A DAY TO TREAT ALL OF THE VICTIMS, BOTH PROFESSIONAL AND OTHERWISE, OF DRUG ABUSE AND ITS COMPLICATIONS. Its chairman and members shall be appointed ANNUALLY by the President.

The Bylaws Committee recommends adoption of this proposed amendment.

4. Proposed Bylaw Amendment to the Peer Review Commmittee Article XI, Section 23

Rationale: To define more clearly the Committee's responsibilities as they relate to the Board of Physician Quality Assurance and to conform to the law as written.

Amend Article XI, Committees, Section 23, Peer Review Committee, as follows: [ ] indicates deletion; CAPS indicate change.

Section 23. A Peer Review Committee shall consist of not less than [nine] FIFTEEN members WITH AN EFFORT MADE TO REPRESENT MAJOR SPECIALTIES. One-third of the members shall be appointed annually for three-year terms by the President. THE CHAIRMAN SHALL BE DESIGNATED ANNUALLY BY THE PRESIDENT. It shall be the duty of this committee to review the practices of Maryland physicians AS REFERRED BY THE PEER REVIEW MANAGEMENT COMMITTEE UPON REQUEST OF THE STATE OF MARYLAND BOARD OF PHYSICIAN QUALITY ASSURANCE. THE COMMITTEE SHALL REVIEW THE PRACTICES OF MARYLAND PHYSICIANS [practicing] in ALL [institutions, offices, and other] locations where medical care is rendered for the purpose of evaluating the PROFESSIONAL, PHYSICAL, AND MENTAL COMPETENCY OF PHYSICIANS [appropriateness of the care rendered as well as the competency and efficiency of the physicians rendering it]. This review shall include, but not be limited to, the quality of care rendered [medications ordered, services other than physical examination provided, and quality of the physical examination given.] AND SHALL BE CONDUCTED WITHIN THE GUIDELINES SET FORTH IN THE PEER REVIEW HANDBOOK. The committee shall also be charged with the review of the quality of care rendered by those persons under the supervision of physicians WHERE APPROPRIATE. [All complaints, allegations, and/or accusations must be as specific as possible, and submitted to the Committee Chairman, in writing, prior to initiation of a review process. The committee shall stimulate component societies to establish similar Peer Review Committees with the same purposes, but if a component society declines to establish such a committee, or refer cases to an already established committee, the Faculty's Peer Review Committee may assume original jurisdiction of the matter. Any party aggrieved by the action of a local Peer Review Committee may, within 30 days of such action, file an appeal in writing to the Peer Review Committee of the Faculty which shall review the matter on appeal; provided, however, that if a local Peer Review Committee fails to initiate or pursue action with respect to any complaint of an aggrieved party within 90 days of the referral of the matter to it, the Peer Review Committee of the Faculty may take original jurisdiction of the matter. This committee's services shall be made available to any third party payor on request, or it may institute a review of the physician's medical care delivery based upon information coming to it from any source, such as other Faculty committees, public interest groups, other professional organizations, local, state or federal agencies, or responsible and competent members of the general public. The identity of any patient, or any identifying information, shall be kept confidential by this committee. The Chairman shall be designated annually by the President.]

The Bylaws Committee recommends adoption of this proposed amendment.

5. Proposed Bylaw Amendment to Establish Attendance Requirements for Members of Council

Rationale: To improve communication between the Council and the component societies.

Amend Article VII, Council, by adding a new Section 7, automatically redesignating subsequent sections: CAPS indicate change

SECTION 7. COUNCILORS REPRESENTING THEIR COMPONENT SOCIETIES SHALL BE REQUIRED TO ATTEND AT LEAST A MAJORITY OF THE MEETINGS

OF THE COUNCIL EACH YEAR OF TENURE. IN THE EVENT A COUNCILOR HAS BEEN UNABLE TO MEET THE ATTENDANCE REQUIREMENTS AS PRESENTED IN THIS SECTION OF THE BYLAWS, THE RESPECTIVE COMPONENT SOCIETY SHALL BE ADVISED OF THE RECORD OF THEIR REPRESENTATIVE'S ATTENDANCE AND SHALL CONSIDER POSSIBLE REPLACEMENT OF THEIR COUNCILOR.

The Bylaws Committee recommends adoption of this proposed amendment.

6. Proposed Bylaw Amendment regarding Membership on Peer Review Management Committee

Rationale: To include the Peer Review Management Committee in the appropriate sections of the bylaws as one of the committees that restricts certain categories of membership from service on the Committee.

Amend Article II, Membership, Section 2(c), as follows: CAPS indicate change

(c) Associate members shall have the right to attend and participate in General Meetings; subscribe to the *Maryland Medical Journal*; have the privileges of the building, the reading room, the use of the books and to hold such meetings in the building as meet with the approval of the Executive Committee. They shall not have the right to vote or hold office in their component societies, but may be appointed to serve on committees of the Faculty, except the Committee on Physician/Patient Relations, the Committee on Physician Rehabilitation, the Committee on Peer Review, THE PEER REVIEW MANAGEMENT COMMITTEE, and the Committee on Drugs. Those associate members who are Doctors of Medicine engaged in the clinical practice of medicine shall have the right of physician's defense.

The Bylaws Committee recommends adoption of this proposed amendment.

Amend Article II, Membership, Section 4, as follows: CAPS indicate change

Section 4. Student members shall consist of those full-time students who are enrolled in an accredited medical school, and who are either domiciled or attending a medical school in Maryland, who apply for such membership on a form provided by the Executive Director. They shall have the rights accruing to associate members except that of physicians's defense, provided that any Student Member of the Faculty who is a member of a component society exclusively composed of such Student Members may exercise full membership rights and duties in such component societies. Student Members may be appointed to serve on, but not as Chairman of, committees of the Faculty except the Committee on Physician/Patient Relations, the Committee on Physician Rehabilitation, the Committee on Peer Review, THE COMMITTEE ON PEER REVIEW MANAGEMENT, and the Committee on Drugs.

The Bylaws Committee recommends adoption of this proposed amendment.

Amend Article XI, Committees, Section 39, as follows:

Section 39. The President, President-elect and Secretary shall be ex-officio members of all committees except the Nominating Committee and the Committee on Physician/Patient Relations, the Commmittee on Physician Rehabilitation, the Committee on Peer Review, THE COMMITTEE ON PEER REVIEW MANAGEMENT, and the Committee on Drugs.

The Bylaws Committee recommends adoption of this proposed amendment.

This concludes the report of the Bylaws Committee.

Computers in Medicine

Mr. President and Members of the House of Delegates:

The Computers in Medicine Committee held several meetings throughout the course of the year. The Committee maintains the Maryland Med-Sig, the computerized bulletin board system of the Medical and Chirurgical Faculty. Dr. H. Gerald Oster has been the system operator (SYSOP) of Med-Sig since its inception. The Committee is involved in helping the Colorado Medical Society set up a similar system. In the past year, we have helped the Pennsylvania and Delaware Medical Societies set up bulletin boards of their own. One of the Committee's goals was to provide the system as an internal Med Chi communication tool for use among Committee members.

The Committee continues a monthly department in the *Maryland Medical Journal*, Computer Bytes, which deals with helpful and current computer tips in the field of medicine. This is in accordance with the

Committee's charge to acquaint and educate physicians in the use of computers in their practices.

The Committee continues to give computer demonstrations to hospital medical staffs, using a computer with a modem, a phone line, and a projection system. Under the direction of Dr. Rafael C. Haciski, the Committee's Chairperson, a one and one-half hour demonstration was given at the Medical Faculty's Annual Meeting dealing with office computerization on the industry's leading equipment. The seminar dealt with office management software, medical software, and some of the new experimental programs being used on the APPLE computer, as well as the IBM compatible.

The Committee demonstrated the Med-Sig bulletin board system at the Medical Faculty's Semiannual Meeting in Ocean City last September.

The Committee also designed and developed a brochure that will make accessing the Med-Sig bulletin board system easier for the novice computer user. The brochure has step-by-step instructions dealing with every aspect of the system, from hardware considerations to the numerous communications software programs available, as well as all of the configurations necessary to link up with the bulletin board.

These are potential future projects:

1. Starting a physicians' computer-user group for both novices and advanced users.
2. Evaluating medical software.
3. Providing physicians with a computer equipment buyers' group.
4. Continuing in the education of physicians using computers.
5. Promoting Med-Sig as a communication tool for physicians in Maryland.

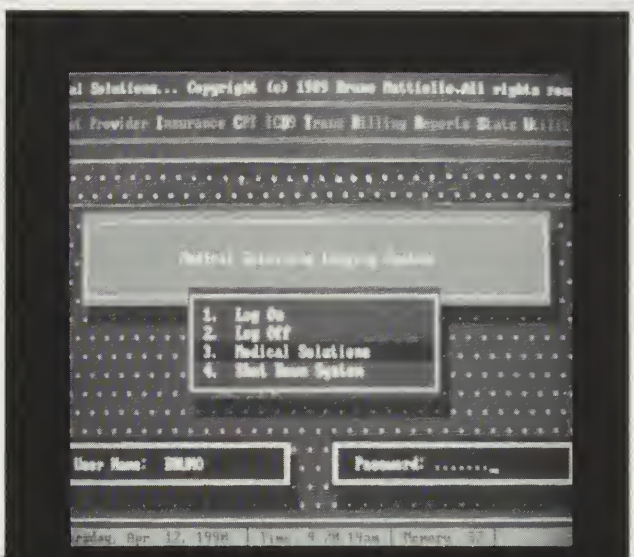
Announcing a cure for the common computer.

Is your practice computer system chronically ill? Or perhaps you're just not getting access to the information you need? At MEDSOURCE, we have the expertise to diagnose and treat your data problems. Whether it's analyzing data for negotiation with HMOs, coordinating clinical research projects or tracking patient care, MEDSOURCE can provide you with healthy, accurate data every time.

We can assist you in the selection of medical record and accounting systems. We'll install new equipment and train your staff. We can even develop customized programs to help you make new use of existing data.



MEDSOURCE's 13 years of experience in computer programming and our in-depth knowledge of the clinical health care field make us the expert in computer systems for practice management. So, the next time you find yourself diagnosing your computer instead of your patients, call MEDSOURCE.

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. Choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package designed and developed by the Computer Services Department at the Medical and Chirurgical Faculty of Maryland. Physicians were consulted at every stage of the applications development to insure an easy-to-use and well-designed system. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500-form billing, appointment scheduling, and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management offers:

- ☐ Appointment scheduler
- ☐ Aging
- ☐ Day sheets
- ☐ Menu driven system
- ☐ On-line help manual
- ☐ Maintainance of patient demographics
- ☐ Insurance billing (1500 form)
- ☐ Walk-out superbill
- ☐ End-of-month bill
- ☐ Statistical reports
- ☐ Accounting reports
- ☐ Unlimited technical support
- ☐ Unlimited software upgrades
- ☐ Unlimited office staff training
- ☐ Automatic back-up and restoration
- ☐ Separate ICD-9 and CPT code databases
- ☐ Multiple diagnosis and procedure transactions
- ☐ Password protection to sensitive areas
- ☐ No annual fee for Med Chi members
- ☐ Clinical demographics

Continuing Medical Education Review

Mr. President and Members of the House of Delegates:

The Continuing Medical Education Review Committee again has sponsored a scientific session during the 192nd Annual Meeting of Med Chi. Bernard Tabatznik MD, served as Moderator of "Learning with 'Lectronics: State-of-the-Art of Computer Assisted Learning Techniques." The invited speakers for this presentation were Tom Piemme MD and Pierre S. Pincetl MD, from the George Washington University School of Medicine. A special feature of the program was a case presentation prepared by H. Gerald Oster MD. An actual on-line hookup with the Harvard Medical School made this session an exciting demonstration of computer-assisted individualized learning, a promising method for enhancing physicians' ongoing educational development.

The Committee held six meetings during the year. Med Chi is responsible for accrediting 59 hospitals and organizations that provide Category I of the AMA's Physician Recognition Award for continuing medical education.

Actions and decisions were made with regard to the following hospitals and organizations accredited by Med Chi to provide intrastate Category I CME programs:

1. American Cancer Society, Maryland Division
2. American Heart Association, Maryland Affiliate
3. American Lung Association of Maryland
4. Anne Arundel General Hospital
5. Baltimore County General Hospital
6. Bon Secours Hospital
7. Carroll County General Hospital
8. Center for Health Education, Inc.
9. Chestnut Lodge
10. Children's Hospital, Inc.
11. Church Hospital
12. Community Psychiatric Clinic, Inc.
13. Crownsville Hospital Center
14. AMI Doctors' Hospital of Prince George's County
15. Dorchester General Hospital
16. Fallston General Hospital
17. Franklin Square Hospital
18. Frederick Memorial Hospital
19. Good Samaritan Hospital
20. Greater Baltimore Medical Center
21. Greater Laurel Beltsville Hospital
22. Harbor Hospital
23. Harford Memorial Hospital
24. Holy Cross Hospital
25. Homewood Hospital Center, Inc.
26. Howard County General Hospital, Inc.
27. Kernan Hospital
28. Leland Memorial Hospital
29. Liberty Medical Center
30. Maryland General Hospital
31. Maryland Hospital Education Institute

Drugs

Mr. President and Members of the House of Delegates.

The Committee on Drugs primarily concerns itself with the prescribing practices of physicians referred to it by the Board of Physician Quality Assurance (BPQA), and the regulations governing the prescribing of amphetamines/methamphetamines.

The first principle that governs the Committee is that physicians will be allowed the widest possible latitude in prescribing practices as currently provided for by federal law and acceptable medical practice. The second principle is that no physician will be intimidated so as to fail to prescribe controlled substances adequately to relieve pain, anxiety, or other symptoms, when such relief is indicated. The Committee is actively involved in providing education to physicians with regard to proper prescribing practices.

The Committee prepared an application format for the prescribing of amphetamines. The Committee also developed and sponsored educational programs on drug policy and prescribing practices at the Med Chi Annual and Semiannual Meetings in April and September of 1989, and members presented testimony for Med Chi before the General Assembly in the matter of triplicate prescriptions. The Committee also held three meetings at Med Chi with leaders in the field of drug abuse and potential drug abuse treatment and education.

Furthermore, we have prepared a major drug education program for October 20 and 21, 1990 to be held at the Baltimore Convention Center, sponsored by Med Chi with the cooperation of the State and Baltimore City Health Departments, and involving the participation of NIDA, Francis Scott Key Medical Center, and Johns Hopkins Hospital.

Committee members and staff will continue to strive to maintain a balance between educating physicians with careless prescribing practices and supporting discipline for physicians who misuse their prescribing privileges.

The Chairman is appreciative of the time, effort and devotion of the Committee members and staff to this important aspect of physician education.

Editorial Board, Maryland Medical Journal

Mr. President and Members of the House of Delegates:

This report covers the period from August 1989 to August 1990, during which *MMJ* maintained good financial health and significant growth. Total page count for Volume 38 was 1,114 (up 118 pages or 11.5 percent from the previous year); issues averaged 95 pages (up 10.5 percent from Volume 37); and distribution was about 7,186 copies per month. Our national and local publisher's representative maintained advertising space in *MMJ* at a 34 percent average across the year. This was slightly lower than in previous years because of the increased number of text pages per issue. Production costs have remained relatively stable for several years (at $ 0.015 - 0.019 per page) despite increasing printing and paper costs; postal rates continue to increase.

There were five special issues produced during this period. The October issue on International Health addressed the role of physicians who lived in or were trained in Maryland in the control/eradication of four specific diseases: yellow fever, smallpox, malaria, and typhoid. One article on primary healthcare showed that what is learned in international health may be applied in areas such as Western Maryland.

The November issue, Understanding and Management of Genetic Disorders, represented a broad range of thought about genetics: from primary care for patients with genetic disorders (as well as their families) to ethical considerations including informed consent, confidentiality, and disclosure to recent advances made in molecular genetics, biochemical genetics, and cytogenetics.

January's Legislative issue included Med Chi's Legislative Directory and four Faculty Position Papers. The February issue, AIDS: Living Long and Living Well, presented 13 articles and commentaries exploring many of the traditional and some of the less-traditional approaches to the treatment and prevention of AIDS. In honor of the Centennial of the Johns Hopkins Hospital and School of Medicine, the April *MMJ* featured 15 articles showing the present generation of physicians and scientists who continue the Hopkins tradition.

The May issue highlighted Reynaldo L. Lee-Llacer MD, 1990-1991 President of Med Chi, who took office on May 11.

There have been 11 Board meetings in this period. In 1989, of 107 manuscripts received, 2 were withdrawn and 29 were not approved, indicating a 28 percent rejection rate. The tentative Editorial Calendar is complete through January 1991, and another three dedicated issues (Systemic Lupus, University of Maryland Department of Medicine, and Cardiovascular Risk Factors: Prevalence and Programs of Interest to Clinicians) are slated for publication during the remainder of next year.

MMJ Managing Editor Ann Wintriss (l) and Associate Editor Henry P. Laughlin, MD (r) discuss upcoming issues of the MMJ.

MMJ continues to invite comments as well as scientific articles. During the 1989 volume year and through June 1990, seven Commentaries and seven Letters to the Editor have been published.

The third annual "Best Article" awards were presented at Med Chi's Semiannual Meeting in September 1989. The best practitioner's article, "Acute Pulmonary Histoplasmosis Outbreak Following Home Renovation," by Carl I. Schoenberger MD, J. H. Weiner MD, Frank J. Mayo MD, Jeanne Spellman MD, and Robert G. Waltersdorff PhD, appeared in the June 1988 issue. The best article by a resident, "Elective Repeat Cesarean Section: Old Controversy, New Concepts," by Charles Canady MD with Phillip J. Goldstein MD, was in the February 1988 issue.

The Editorial Board and the Managing Editor are most grateful to various specialists in the Maryland medical community who graciously contribute their time and expertise to the review of manuscripts for our publication. The following physicians assisted in *MMJ's* review process during the past year:

John G. Bartlett MD, John A. Kastor MD, Eugene Katz MD, Kenneth B. Lewis MD, Paul R. McHugh MD, Joseph S. McLaughlin MD, Lawrence C. Pakula MD, Bruce A. Reitz MD, and Myron L. Weisfeldt MD.

We also appreciate the careful attention of individual department editors who monitor their columns for scientific accuracy and correct citations.

Those associated with the production of the *Maryland Medical Journal* encourage Med Chi members to communicate regularly and often about any and all facets of the publication.

Elmer Hoffman MD
Carmine M. Valente PhD, Advisory Member
Ann Wintriss, Managing Editor

Emergency Medical Services

Mr. President and Members of the House of Delegates:

The Committee is pleased to report that it conducted three meetings during the course of this year and discussed many subjects of current importance to Emergency Medical Services (EMS); including emergency department (ED) overcrowding, EMS on the Conjoint Managed Care Committee and the Medicaid Initiative.

Because statistics from a survey of 50 Maryland hospital emergency departments, conducted by the Maryland Chapter of the American College of Emergency Physicians (ACEP), revealed that 75 percent of the departments experienced some degree of overcrowding, the Committee prepared and forwarded a formal letter to the President of Med Chi alerting and apprising him of this serious condition. The Committee was also very supportive in promoting and attending the presentation on ED overcrowding by Stephan G. Lynn MD, the National ACEP Task Force Chairman on ED Overcrowding. The presentation was cosponsored by Med Chi and the Maryland Chapter of ACEP during the Med Chi Annual Meeting.

The EMS Committee developed a list of HMO and perceived patient care inadequacies for presentation to the Conjoint Managed Care Committee. On April 26, 1990, a final document of this Committee was returned to each representative organization for final ratification and incorporation. Unless specifically disapproved, this document will serve as policy governing the patient care, operational and financial issues as agreed. Many of the concerns that were brought by the EMS Committee were discussed and resolved. It was stressed that emergency physicians should serve as patient advocates in emergency healthcare situations.

Other issues of interest discussed by the Committee include:

a. The new MIEMSS helicopter protocol
b. The MIEMSS hospice protocol
c. The development of a computer registry of patients with a living will
d. The possible role of veterinary services during disasters and other mass emergencies
e. The development of a section of the Med Chi computer bulletin board for EMS activities
h. Availability of emergency obstetrical and pediatric services in sections of Maryland
g. ACEP position paper on "Patients' Rights and Responsibilities Under Managed Care"

It has been my pleasure to serve Med Chi as Chairman of this Committee.

Finance

Mr. President and Members of the House of Delegates:

The Finance Committee met regularly to monitor the actual income and expenditures compared to the Budget for the year 1989. A zero-based budget was developed for the year 1990. It is divided into departments or cost centers so that results of operations can be identified and controlled more efficiently. The consolidated budget for 1990 reflects a small net income in excess of expense.

A meeting was held with representatives of the Bowman Financial Management Company to review the Faculty investment portfolios. The market value of the Consolidated Fund at December 29, 1989 was $1,720,215. The Steiner Fund market value was $1,009,652. The Pension Plan Fund was $1,434,587. The year 1990 opened with the Dow Jones Industrial Average rising almost 57 points to a record high. The rally was triggered, in part, by a report that the economy's slide toward a recession may have slowed.

The Faculty remains in a solid financial condition, and the outlook for 1990 is very positive.

Hospital Medical Staffs

Mr. President and Members of the House of Delegates:

The Committee on Hospital Medical Staffs addressed the concepts and ideas expressed in a number of resolutions developed during the AMA's 1989 Annual Meeting. Specifically, it supported the position that third-party funds paid to hospitals for legally mandated, medical quality assurance peer review and credential activities be used to compensate medical staff members for time devoted to work in these areas. To conform with the spirit of AMA resolutions 37, 163, 224 and 231, and in compliance with JCAHO medical self-governance and due process standards, the Committee supported the development of a uniform due process and fair hearing procedure for hospital medical staff members whose privileges may be restricted prior to reporting such actions to state and federal agencies. In essence, this was accomplished by the inclusion of such procedural requirements in the model medical staff bylaws developed by Med Chi legal services.

A large portion of the Committee's effort was directed toward the development of a centralized credentialing service for hospital medical staff members. The Maryland Hospital Association joined with Med Chi to provide this essential service through a separate joint venture comprised of representatives from the parent organizations.

The Committee continued to provide advisory counseling and mediation activities in the area of medical staff and hospital relationships. A number of hospital medical staffs participated in this Med Chi provided service.

As Chairman, I wish to express my sincere appreciation to the members of the Committee for their dedication. On behalf of the Committee, I would like to thank the Executive Committee and the Council for their continued support and encouragement.

Legislative

Mr. President and Members of the House of Delegates:

The 1990 Maryland General Assembly was another productive legislative session for the physicians of Maryland. With the guidance and support of Governor William Donald Schaefer, Speaker of the House R. Clayton Mitchell, Jr., and President of the Senate Thomas V. Mike Miller, Jr., many needed changes to existing law were effected. Other measures designed to erode the quality of healthcare in Maryland were defeated.

The physicians of Maryland were well represented through the Chairman of the Committee, Susan Guarnieri MD, and lobbyists Gerard Evans, Alan Rifkin, Judge Edgar Silver, Linda Lamone and Gregory Hall of the law firm of Rifkin, Evans, Silver and Lamone.

The following account of major issues considered by the Legislative Committee of the Medical and Chirurgical Faculty covers only legislation of significant statewide interest tracked by the Government Relations Office.

The Government Relations Office is staffed to answer and address concerns of physicians through legislative action. Contact Gerard E. Evans, Esq., General Counsel, 224 Main St., Annapolis, MD 21401 if you have any concerns or questions about how the office may assist you.

The Faculty thanks F. Carvel Payne, Director, State Department of Legislative Reference, for graciously providing most of the following information.

The 1990 Session of the Maryland General Assembly had several surprises, not in terms of legislation introduced or amended, but in the way several physician groups addressed major bills. Although the Medical and Chirurgical Faculty is widely recognized as the institution that speaks for Maryland physicians, it becomes increasingly difficult to present a united front when other medical groups hold positions different from the State Medical Society and, in fact, oppose the Faculty's legislative agenda. Most Legislators, like the public at large, become confused when confronted with diverse and opposing views concerning the practice of medicine. At the national level, some physician groups are acting independently of organized medicine. Unfortunately, we now see this happening in Maryland. Fortunately, the Faculty has a proud tradition in Annapolis working with Legislators. Consequently, the Faculty's opinion carries significant authority.

The Faculty enjoys success in Annapolis largely due to the effort of individual physicians. Countless physicians took time from their practices and families to promote Med Chi's lobbying effort during the 1990 Session. Unlike many other organizations, Med Chi members as individual practitioners have relationships with members of the Maryland General Assembly. These relationships, founded on trust, give physicians invaluable access to Legislators, who respond not to some faceless organization but to the needs of a highly regarded association comprised of dedicated medical practitioners. If the Faculty is to enjoy continued success in Annapolis, these physician key contacts must be further developed and expanded.

Issues such as Mandated Medicare Assignment, physician ownership of and referral to healthcare facilities, and triplicate prescription will probably be seen in the upcoming Legislative Session. It is imperative that physicians keep up-to-date on these issues so that a united front can be maintained by the Faculty when these issues are discussed.

Abortion The abortion rights proposal, Senate Bill 356/House Bill 432 (both failed), as originally introduced, would have prohibited the State from interfering with the decision of a woman and her physician to have an abortion if the physician concluded in good faith and in the physician's best medical judgment, that the fetus was not viable. Once the fetus was viable, a physician would have been prohibited from performing an abortion unless the physician concluded that the woman's life was in danger, or the fetus was affected by a genetic defect or serious deformity or abnormality. The Omnibus Bills would have allowed a physician to perform an abortion on an unmarried minor without parental notification if, in the professional judgment of the physician, the minor were mature and capable of giving informed consent. Prior to performing an abortion on a minor, the physician would have had to obtain the minor's informed consent. Senate Bill 356/House Bill 432 also would have repealed an existing but unenforceable Maryland statute that requires all abortions to take place in an accredited and licensed hospital and be approved by a hospital abortion review committee.

Although Senate Bill 356 was passed by the Senate Judicial Proceedings Committee, its report to the Senate floor prompted an 8-day filibuster. In order to bring an end to the filibuster, a compromise was reached between the two sides. As a result of the compromise, the Omnibus Bill and an anti-abortion

Physicians registering at this year's Annual Meeting received a Med Chi Meeting folder containing the program, related flyers and tickets to social events, as well as computer-generated nametags.

Council Chairman J. David Nagel, MD officiates at the Council Meeting.

measure, Senate Bill 836 (failed), were both amended and passed on to the House of Delegates.

As originally introduced, Senate Bill 836 would have required facilities that perform abortions to submit quarterly reports to the Department of Health and Mental Hygiene. The Department would then have been required to compile a statistical report based on the information provided in the quarterly reports. Senate Bill 836, as amended in accordance with the compromise, would have prohibited a physician from performing an abortion when the unborn child was determined to be nonviable unless the physician certified by affidavit that the procedure was necessary and: (1) continuation of the pregnancy was likely to result in the death of the woman; (2) the woman was the victim of rape, sexual offense, or incest, which had been reported to a law enforcement agency or a public health or social agency; (3) the unborn child was affected by a genetic defect or serious deformity or abnormality; or (4) there was a substantial risk that continuation of the pregnancy could have a serious and adverse effect on the woman's present or future physical health. If the physician determined that the unborn child was viable, Senate Bill 836 would have prohibited the physician from performing the abortion unless it was necessary to save the life of the woman. Further, if the physician determined that the abortion was necessary to save the life of the woman, the physician would have been required to call in a second physician to attend the infant-patient in case the infant-patient survived the abortion attempt. Senate Bill 836 would have also set up a judicial bypass system for minors to be used when the physician could not give the required written notice to the minor's parents or guardian prior to performing an abortion, or when notice would have been in the minor's best interest.

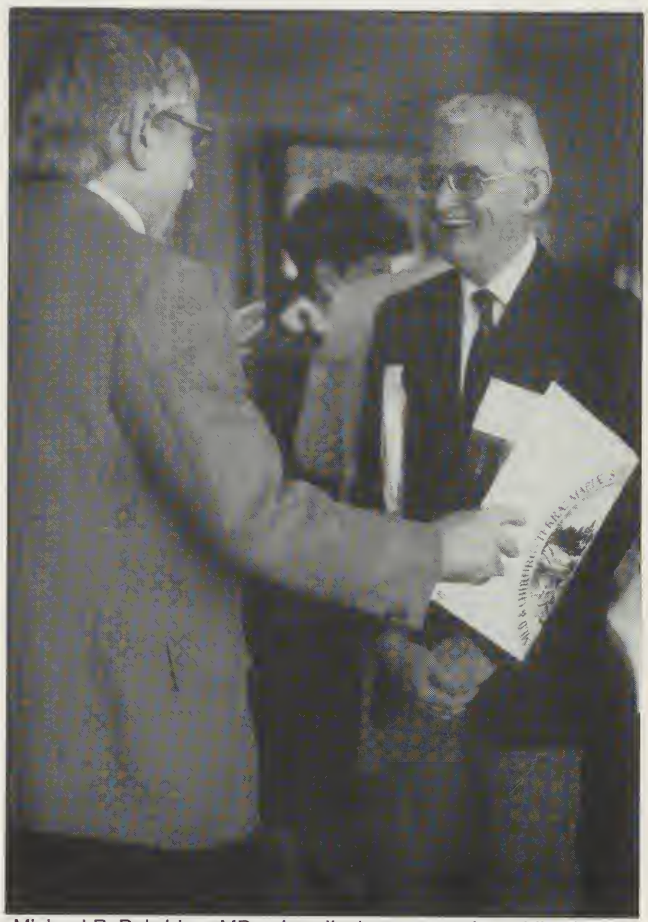
As amended, both bills would have: (1) prohibited abortions performed solely for sex selection; (2) required physicians who perform abortions to comply with certain practice standards; (3) required a physician to perform viability testing if the physician believed that the woman was carrying a viable child, or an unborn child of 20 or more weeks gestational age; (4) required the voluntary and informed consent of the woman and that certain information be given to the woman; and (5) required any person who performs abortions to complete a statistical form designed by the Department of Health and Mental Hygiene.

As part of the compromise and with the expectation that both the anti-abortion measure and the abortion rights measure would be presented to the voters by referendum, both bills contained contingency clauses. Senate Bill 836 would have taken effect only if Senate Bill 356: (1) was enacted by the General Assembly and signed by the Governor; and (2) was rendered void, in its entirety, for any reason, including disapproval by the voters in a referendum. The contingency clause on Senate Bill 356 simply stated that it was contingent on the enactment and signing by the Governor of Senate Bill 836.

Both bills failed in Committee in the House of Delegates.

Other bills relating to the issue of abortion contained elements that were incorporated into one or both of the bills that passed in the Senate.

AIDS Insurance Assistance Pilot Program Individuals with AIDS and HIV-related diseases often become so ill that they are unable to work. When they become unemployed and are unable to continue to purchase health insurance, many eventually come to rely on the Medical Assistance Program to pay for their medical expenses. To help alleviate this monetary strain on Medical Assistance, the General Assembly established the Maryland AIDS Insurance Assistance Pilot Program. This 2-year Pilot Program, contained in House Bill 905 (passed), authorizes the Secretary of Health and Mental Hygiene to pay insurance premiums to insurance carriers or employers of persons with HIV-related diseases. The Program will be limited to a maximum of 150 persons at any one time. To be eligible, an individual: (1) may not have cash assets exceeding $10,000; (2) may not have family income exceeding 200 percent of the federal poverty level; (3) must not be eligible for continuation of benefits through the individual's former employer and



the provisions of the Consolidated Budget Reconciliation Act of 1985; (4) must not be eligible for health insurance through another family member; (5) must be certified by a physician to be HIV positive and as a result, either too ill to continue working or unable to work within 3 months; and (6) must be a resident of the State.

House Bill 905 requires the Department of Health and Mental Hygiene to submit an annual report to the Governor and the General Assembly that summarizes program expenditures, numbers of recipients, program effectiveness, the estimated savings to the Medical Assistance Program, additional costs incurred by private insurance companies, and the loss of federal funding.

Other AIDS Legislation The legislature considered again, but did not pass a number of bills introduced that would have required the notification of individuals when there has been an exposure or potential exposure to the human immunodeficiency virus (HIV) infection, AIDS, or AIDS-related disease. House Bill 570 (failed) would have required that an individual furnish a blood sample to be tested for the presence of the HIV infection when a documented exposure occurred between the individual and a healthcare provider. Senate Bill 496/House Bill 574 (both failed) would have required notification to morticians or notification on a death certificate, if the deceased was diagnosed as having AIDS, AIDS-related disease, or the HIV infection. Senate Bill 598/House Bill 721 (both failed) would have required mandatory testing for sex offenders. House Bill 434 (failed) would have mandated reporting the names of persons testing positive for HIV infection to the Department of Health and Mental Hygiene.

Two bills aimed at the insurance industry and AIDS testing failed for a second time. House Bill 1155 (failed) would have allowed a heath maintenance organization to test applicants for the presence of HIV infection or for a sickness or medical condition derived from the HIV infection, if the test is given to all such applicants or the decision to test is based on an applicant's medical history. House Bill 1172 (failed) would have allowed an insurer to test for the presence of the HIV infection or for a sickness or medical condition derived from HIV if the test is required for all persons in the applicant's risk class with the same threshold coverage amounts, or the decision to test is based on the applicant's medical history or current medical condition.

Medical Assistance An administration proposal, Senate Bill 388/House Bill 498 (both passed), expands medical and healthcare coverage under the Maryland Medical Assistance Program to include children from age one through five years whose family incomes fall below 133 percent of the poverty level and authorizes the State to provide coverage to children ages six and seven whose family incomes fall below 100 percent of the poverty level. This bill was necessary due to changes in federal law requiring coverage of children in the one to five category beginning April 1990. This change is expected to expand coverage to an additional 13,688 children in the State. House Bill 351 (CH.44) raises the co-payment under the Pharmacy Assistance Program from $1.00 to $1.50 due to the increase in the cost of pharmaceuticals.

Michael R. Dobridge, MD enjoys lively conversation while visiting technical exhibits at the meeting.

Alcohol and Drugs Senate Bill 722 (passed) repeals the authority of a judge to commit a criminal defendant with a chronic alcohol problem to the Department of Health and Mental Hygiene for evaluation and treatment.

House Bill 563 (passed) requires the Alcohol and Drug Abuse Administration to evaluate the success and effectiveness of each alcohol abuse and drug abuse treatment program licensed or certified by the Department of Health and Mental Hygiene. This evaluation must consist of outcome research studies performed on a representative sample of individuals who have received treatment under the program to determine the extent to which individuals: (1) have been successfully discharged from the treatment program; and (2) have successfully controlled their alcohol or drug abuse problems after being discharged from the program. House Bill 563 requires that the Administration adopt regulations necessary to perform the required

outcome research studies and establishes an Alcohol and Drug Abuse Treatment Research Advisory Committee to develop the methodology necessary to conduct the outcome research studies and advise the Administration.

Professionals Seeking Regulation The General Assembly considered two proposals that would have regulated additional classifications of health professionals. Senate Bill 486/House Bill 937 (both failed) would have established the Board of Human Services Professionals to serve as an umbrella regulatory board for marriage and family therapists and professional counselors. Under the bills, each practice specialty would have had a Standards Committee that would have established requirements for certification in the particular practice specialty. House Bill 1314 (failed) would have required the State Board of Chiropractic Examiners to establish a registration system for massage practitioners, in addition to criteria for education, training, and experience.

Rehabilitation Committees House Bill 1187 (passed) requires the establishment of rehabilitation committees for the following health occupations that do not already have such committees: audiologists, chiropractors, dental hygienists, dietitians and nutritionists, electrologists, morticians, nursing home administrators, podiatrists, professional counselors, psychologists, social workers, and speech language pathologists. In order to achieve administrative economy, a rehabilitation committee may function jointly with the rehabilitation committee of another health occupation.

Credentialing of Physicians Senate Bill 784/ House Bill 1255 (both passed) alter the definition of a medical review committee to include a new organization, Healthcare Credentials Verification, Inc. This nonprofit corporation will collect and disseminate the information needed by hospitals to credential physicians for medical staff appointment and reappointment. The peer review information maintained by the organization will receive the same protection from discoverability and disclosure that currently applies to the information maintained by medical review committees in hospitals.

Physicians view a slide presentation during one of more than 35 Scientific Sessions at Med Chi's 192nd Annual Meeting.

Healthcare Practitioner Investment In recent years, both state and federal lawmakers have focused on investments by healthcare practitioners in healthcare services to which referrals are made. Opponents of investment argue that practitioner investment results in overutilization of medical services and corresponding increases in healthcare costs, in addition to the creation of a conflict between the best interests of a patient and the financial interests of the referring practitioner. Proponents argue that this type of investment encourages healthy competition among physicians, and that in some communities, physician investment may result in the availability of a service that otherwise would not have been available in a community.

Legislation concerning healthcare practitioner investment was introduced during the 1990 Session but did not pass. House Bill 779 (failed), as amended, would have prohibited a physician from referring a patient to a bioanalytical laboratory in which the physician had a financial interest. Senate Bill 670 (failed) would have prohibited a physician from referring a patient to a healthcare service or receiving a referral of a patient from a healthcare service, if the physician would have received a direct or indirect rebate, refund, commission, unearned discount or profit, or other unearned valuable consideration for the referral. Senate Bill 585 (failed) would have prohibited a healthcare practitioner from referring a patient to a healthcare service in which the physician had a financial interest, unless the practitioner disclosed to the patient the existence of the interest.

Dispensing of Prescription Drugs A bill that would have established a Prescription Drug Utilization Review Program in the Department of Health and Mental Hygiene failed during the 1990 Session. Senate Bill 658 (failed), as amended, would have created a Prescription Drug Oversight Commission to develop and implement a program to curb the diversion of Schedules II, III, and IV controlled dangerous substances into unlawful channels and retard the misuse of these drugs in this State. The bill would have also established a Drug Utilization Review Coordinating Office that would have collected information on providers, prescribers, and patients. The Division of Drug Control would have analyzed the prescribing and dispensing patterns of prescribers and dispensers. The Governor has issued an Executive Order which sets up a structure very similar to the proposed legislation aimed at prescription drug abuse.

Legislation was passed affecting the prescribing and dispensing of prescription drugs by nurse midwives, in addition to the prescribing of prescription drugs by nurse practitioners. Senate Bill 714/House Bill 683 (both passed) authorize a nurse midwife who treats patients at a nonprofit medical facility, a health center on a campus of an institution of higher education, a public health facility, a medical facility that contracts with a State or local health department, or a publicly funded facility to prescribe and dispense certain sub-

stances commonly used in the practice of nurse midwifery. Senate Bill 715/House Bill 1191 (both passed) expand the definition of "authorized prescriber" to include other individuals who are authorized by law to prescribe drugs, medicines, or devices. This will enable nurse practitioners to prescribe certain drugs.

State Board of Physician Quality Assurance Legislation altering the operation of the State Board of Physician Quality Assurance passed in this Session. Senate Bill 138 (passed) authorizes the Board to place a physician on inactive status and to order an allied health professional to submit to an appropriate examination in connection with an application for licensure, certification, or registration, or in connection with an investigation of an allegation against an allied health professional. In addition, the bill establishes antilapse provisions for acupuncturists, physician assistants, and other allied health professionals and requires the Board to assess each applicant for licensure to practice medicine or for renewal of a license, a biennial fee of $50 to be used to fund the Physician Rehabilitation Program.

Medical Records Senate Bill 584 (passed), the product of interim study, requires healthcare providers and facilities to keep the medical record of a patient confidential and mandates disclosure of the record upon the authorization of the patient or the "person in interest" for the patient. The bill sets up procedures for obtaining a record, permits disclosure without authorization in specified circumstances, and details when disclosure of a mental health record without authorization is allowed (for example, to the director of an adult or juvenile correction or detention facility). A related bill, Senate Bill 736 (passed), mandates that when an individual is transferred between units of a public mental hygiene facility or between facilities, records necessary for continuing care must be transferred as well.

Regulatory Measures The Committee provided resources in the form of people and written testimony to the Maryland Health Resources Planning Commission regarding its adoption of Cardiac Surgery and Therapeutic Catheterization Services in the State Health Plan. The Committee was also involved with physician laboratory regulations proposed by the Laboratory Administration of the Department of Health and Mental Hygiene. Currently, the Committee is assisting with the adoption of HIV testing guidelines.

Many instructive topics are covered during the scientific sessions where Maryland physicians earned CME credits.

Liaison with the Medical Assistance Program

Mr. President and Members of the House of Delegates:

The Liaison Committee with the Medical Assistance Program has devoted most of its time this year to plans of the Department of Health and Mental Hygiene (DHMH) to institute a system of managed care for Maryland Medicaid recipients. Under the proposed program, effective January 1, 1991, each Medicaid patient would choose a primary care provider (PCP), who would be responsible for approving most non-emergency medical care services for the patient. It is anticipated that healthcare coordinated by a patient's physician would be less costly and more efficient than the present system and that this arrangement would dramatically reduce duplication of services and inappropriate use of costly emergency room services. In addition to increasing the quality of care and reducing costs, one state with a similar program (Kentucky), reports improved continuity of care and a high level of satisfaction by physicians and patients in the program.

Committee members were given opportunities for input early in the planning stage. We have emphasized the importance of streamlined procedures, the reduction of paperwork and hassle for the primary care physician, and quality of care issues. As a result of savings that would accrue from a managed care system, DHMH has stated that fees for primary care services (consultations and office visits) would be substantially increased. By direction of the Med Chi Council, the Committee will be working with DHMH on introducing the Program to physicians and Medicaid recipients, and reviewing promotional materials and other aspects of marketing. In the next year we hope that Med Chi will have an opportunity to help evaluate the effectiveness of the program and have a role in resolving problems that may arise during or after implementation.

Library and History

Mr. President and Members of the House of Delegates:

In 1989-1990, the Library and History Committee met seven times.

Four goals, two short-term and two long-term, were identified and addressed: 1) Evaluation of the quality and quantity of library services; 2) Methods of increasing revenue for the library; 3) Maintenance and preservation of the rare book, pamphlet and portrait collections and 4) plans for publications and exhibits in celebration of the Bicentennial of the Medical and Chirurgical Faculty of Maryland in 1999.

Short-Term Goals *Evaluation of the quality and quantity of library services.* Two surveys, conducted in 1989, were evaluated. A questionnaire relating to knowledge and use of the library's services was sent to all Maryland medical libraries. There was a 44 percent return rate. Ninety-one percent of the libraries were aware of our services. A number of libraries requested copies of our brochure outlining these service. Several libraries suggested that we supply them with a poster to acquaint their users with our services.

A survey was also made of individual Med Chi members' use of library services. This questionnaire offered members the opportunity to request new services. A total of 571 questionnaires were returned by individual members of Med Chi. The majority of members use journals as their primary source of medical information. Hospital libraries are their primary source for references. The computerized Med-Sig Bulletin Board, a free service operating 24 hours a day for library requests and exchange of information, was popular with physicians who have home computers. No specific new services were requested.

Use of the library services remained constant for 1988-1989 and for 1989-1990, with one pleasant exception. Requests from local and out-of-state medical libraries increased 200 percent, indicating widespread recognition of the library in terms of available information and quick and efficient service.

Methods for increasing revenue for the library. The charges for the use of the library and its services by non-members and organizations were compared with charges of a number of local and national medical libraries. Med Chi's charges were found to be substantially lower than charges by other libraries. We have, therefore, increased our fees for non-members, to bring them in line with current charges by medical libraries. We estimated that the revenue from these services will increase between 50 and 75 percent in the next calendar year.

There have been other methods for increasing revenue. Mr. Szczepaniak is currently serving as a consultant to the Western Maryland Outreach Pilot Project, a program funded by the National Library of Medicine to teach health professionals computerized literature-searching.

A brochure describing the meeting and catering

facilities available at Med Chi has been completed and will be distributed to approved caterers in the area. This brochure should increase public awareness of our facilities and increase income from room rentals.

Mr. Szczepaniak plans to apply to the National Endowment for the Arts for a grant to support the preservation of the pamphlet collection. He is also investigating other funds that might support preservation of the rare book collection.

Long-Term Goals *Maintenance and preservation of the rare book, pamphlet and portrait collections.* Mr. William Sleeman, our archivist from February to December 1989, has developed a comprehensive 5-year plan for the computerization and preservation of the rare book, pamphlet and portrait collections. Mr. Sleeman's departure in December has left the library without a full-time archivist and the plan could not be implemented. However, continuation on a reduced scale of deacidification of the pamphlet collection has continued; the pilot program having demonstrated the safety of this method of preservation. The Committee now plans to solicit the services of a small cadre of retired members of the Faculty to volunteer to proceed with the 5-year plan. Mr. Sleeman has agreed to offer a training course to these volunteers; and workspace and supervision will be provided by current library staff. Estimates for the cleaning and repair of the portrait collection have been obtained but funds are not available at the present time.

Plans for the library's role in the Bicentennial Anniversary of the Med Chi Faculty. The Committee has continued to explore the most appropriate way to update the two volumes published for the centennial and sesquicentennial years; Eugene Cordell's *Medical Annals of Maryland* and *Celebration of the Sesquicentennial of the Medical and Chirurgical Faculty of the State of Maryland.* Possibilities include an update of the 1949 sesquicentennial volume; a history of Med Chi from 1950-1999 compiled from Med Chi records and interviews with ex-presidents of Med Chi; and an oral history of medicine in Baltimore from 1950-1999. The Committee would welcome hearing from any members who would like to participate in this project.

Dr. Ronald Fishbein has met with Mr. Paul Hadley, Director of the Maryland Science Center, and Ms. Rayleen Decatuer, Director of Exhibits of the Maryland Science Center, and a joint exhibit directed toward interesting school students in the field of medicine is being explored.

The Committee wishes to extend its thanks to Adam Szczepaniak and William Sleeman for their hard work and cooperation with the Committee. As Chairperson, I would like to thank Committee members for their cooperation, enthusiasm and support of the library. A special thanks goes to the commuting members of the Committee.

Long-Term Care and Geriatrics

Mr. President and the Members of the House of Delegates:

The Committee on Long-Term Care and Geriatrics met seven times during the 1989-1990 year to discuss areas related to long-term care and geriatric medicine.

The Committee continued its long-standing commitment to assuring the highest quality of care in long-term care facilities, concentrating on establishing medical quality assurance guidelines for use in long-term care institutions. The intent of an upcoming survey to nursing home medical directors, alternate medical directors, and the academic community, is to establish a state-wide consensus on the minimum guidelines for standards of care in nursing home medicine for admission history and physicals, routine care and annual examinations. The survey results will be used to assist medical directors in their quality assurance efforts in nursing homes through standardization of documentation of mandated doctor/patient interactions and clarification of medical staff responsibilities. The guidelines should also be helpful in license and certification surveys, and for the documentation necessary for re-evaluation of reimbursement for services in the long-term care setting.

The Committee sponsored a scientific session at the 1990 Annual Meeting of Med Chi entitled "Long-Term Care Insurance." The attendance and response were good.

The Committee looks forward to the coming year and will strive to provide appropriate education to physicians and the public. The Chair appreciates the dedication of the Committee members and the Faculty staff.

Managed Care and Third-Party Liaison

Mr. President and Members of the House of Delegates:

During 1989-1990, the Committee addressed the concerns of Maryland physicians regarding practices and procedures of third-party carriers.

The Committee met with senior executive staff of Blue Cross and Blue Shield to discuss the physician profile system. Reimbursement levels for office visits have been the most frequent complaint since the last profile increase two years ago. The system, however, will be maintained until approximately 1991, then replaced by the Resource-Based Relative Value Scale (RBRVS).

The RBRVS is the outcome of a Harvard study completed for the Health Care Financing Administration (HCFA). It is an index which assigns a numerical value (not monetary) to most of the 7,000 services listed in the CPT-4 (Current Procedure Terminology), based on a variety of factors including time spent with a patient, the intensity associated with providing a service, practice costs, and the opportunity cost of training. It was designed to replace the current Medicare CPR (customary, prevailing, and reasonable) charge system which has been criticized as being inflationary, complex, unpredictable, inequitable, and incorporating inappropriate incentives.

The Committee further recommended that Med Chi develop a monitoring mechanism through which members may inform Med Chi of difficulties encountered with third-party carriers.

Med Chi Insurance Fund

Mr. President and Members of the House of Delegates:

The Insurance Fund Board of Directors met six times and also conferred by several telecom conferences during the year 1989. The Insurance Board governs the Med Chi Agency, the wholly owned subsidiary of the Faculty.

The Agency has been expanded, and has begun to provide more products and services directly, rather than through other brokers. Mr. Ronald Fisher has extensive experience in property and casualty operations. He is in charge of marketing, as well as supervising the entire operation. A new producer has been added to staff; Mr. Louis Joffe has many years experience in property and casualty lines.

Mrs. Katherine Downey has retired after more than 24 years of service with the Med Chi Insurance Fund and the Agency. She has been replaced by Mr. Henry Lingenfelder, who is licensed and experienced in Life Insurance and Disability Plans. He is a welcomed addition to the staff.

The Board approved benefit increases in the Hartford Disability Plan. The surgical schedule was increased from $300 to $500 with no increase in premium rates.

The Blue Cross and Blue Shield coverage was reduced to three options available to the membership. In addition to the traditional plan with Blue Shield Plan C and the Major Medical with the basic plan, a custom comprehensive program was installed with a $1000 deductible and 80/20 copay to $5,000 or $10,000 family stop loss. The rates were increased, but for less than any other association plans.

The Agency is still the number one representative for the Medical Mutual Professional Liability business. In 1989, Med-Mutual reduced the number of agents from 600 to about 40. The Agency has substantially increased the volume of Med-Mutual policy holders, and it will continue to grow in the years ahead.

The Agency had another successful year, and the membership will benefit as a result. The Board is very appreciative of the enthusiastic support of the membership, and will continue to provide high quality, competitively-priced products and services.

Medicine and Religion

Mr. President and Members of the House of Delegates:

The Medicine and Religion Committee held four meetings during the past year. Activities included:

a. Sponsoring a Prayer Breakfast during the 1990 Annual Meeting at Turf Valley Hotel and Country Club. The Reverend Ernest R.D. Smart, Pastor of the Second Presbyterian Church, Baltimore, Maryland, gave a stimulating and thought-provoking address entitled "How Long Have You Had This?"

b. Developing a long-range plan to cosponsor a workshop on a bioethical theme with faculty from the University of Maryland's Institute for Philosophy and Public Policy.

Medicolegal

Mr. President and Members of the House of Delegates:

The Medicolegal Committee, sponsored jointly by the Medical and Chirurgical Faculty of Maryland, the Maryland State Bar Association and the Baltimore City Bar Association, has continued its work in bringing the medical and legal professions closer together. The Committee rendered advisory opinions on complaints from both disciplines. Again this year, the Committee organized a Medicolegal Hotline staffed by Committee members for quick resolution of simple disputes.

Medicolegal Committee Co-Chair George H. Greenstein, MD accepts a Certificate of Appreciation from President Raymond M. Atkins, MD for his year of dedicated work.

The Committee also sponsored a program at the May Annual Meeting of the Faculty entitled "AIDS - A Medical and Legal Review and Update for the 1990s." The program was moderated by a member of the Medicolegal Committee, Nancy E. Gregor, Esquire.

The Co-Chairs of the Committee thank the Committee members for their assistance and support during the past year.

Mental Health

Mr. President and Members of the House of Delegates:

The Committee on Mental Health held six meetings during the past year. Activities included:

a. Submitting articles for publication in the *Maryland Medical Journal.* An ongoing goal of the Committee has been to improve communication and collaboration between psychiatrists and other physicians in Maryland via the column "Today's Psychiatry" in the *Maryland Medical Journal.*

b. Sponsoring the presentation "Movement Disorders in Primary Care and Psychiatry" at Med Chi's 192nd Annual Meeting. The presentation was well received.

The Committee looks forward to a productive 1990-1991 year.

Music Medicine Clearinghouse Advisory Board

Mr. President and Members of the House of Delegates:

After an eventful first year, the Music Medicine Clearinghouse continued to progress during 1989-90. The Board held only two meetings, but much was accomplished through phone consultations and correspondence.

In June of 1989, the Clearinghouse Coordinator, Susan Harman, attended the Special Libraries Association's annual conference in New York City. During her stay, Ms. Harman visited the Miller Health Care Institute for Performing Artists at St. Luke's/Roosevelt Hospital. She toured their facilities, met staff, and viewed videotapes showing the progress of several patients. Staff member John Kella contributed a large group of reprints to the Clearinghouse.

In August, Ms. Harman attended the Symposium on Medical Problems of Musicians and Dancers in Snowmass, CO., as well as the National Flute Association's (NFA) annual convention in New Orleans. At the NFA meeting she gave a brief talk about the Music Medicine Clearinghouse. A booth in the exhibit hall sponsored by the NFA Dysfunction Committee included the Clearinghouse brochure, bibliographies, and other items. The Clearinghouse received a number of reprints and several research questions as a result of these two meetings.

The September 1989 issue of the *Maryland Medical Journal* included a Library Page entitled "Music Medicine Clearinghouse--Progress Report." Several inquiries from member physicians resulted from this article. A number of local musicians have also contacted the Clearinghouse for assistance in obtaining reprints and information.

In October, Ms. Harman attended a meeting of the International Arts Medicine Association's (IAMA) Information Management Committee in Philadelphia. In March, the IAMA sponsored an arts medicine information management mini-symposium in Philadelphia. Those attending were from various arts therapy and special education fields, as well as performing arts medicine. Ms. Harman gave a short presentation on the Music Medicine Clearinghouse.

A group from the Hogeschool Nijmegen in the Netherlands has developed a music therapy database they are now expanding to other European countries. They would like to create a similar system in the United States and include a section for performing arts medicine. Ms. Harman has agreed to serve on an ad hoc working group to assist in developing the performing arts medicine section of the system.

During the first third of 1990, Ms. Harman completed a chapter on the history of performing arts medicine for a textbook. *Performing Arts Medicine*, edited by Drs. Robert Sataloff, Alice Brandfonbrener, and Richard Lederman, is scheduled for publication in September 1990 by Raven Press. The writing of this chapter brought the Clearinghouse to the attention of several people and organizations who have contributed many reprints to the collection.

On April 20, 1990, Ms. Harman and board member Jeffrey Palmer MD attended a program at the Bennett Institute for Sports Medicine and Rehabilitation at Children's Hospital. The Institute is setting up a performing arts medicine specialty service and wanted to get suggestions from local experts.

In May, the Clearinghouse participated in the Faculty's Annual Meeting, sponsoring a session on "Voice Disorders and Treatment as Concerns the Singer." Speakers were Samuel Lumpkin MD, an otolaryngologist; Sandra Bishop MS, a speech pathologist; and Ruth Drucker, a professional soprano and vocal teacher. All three are active in the local Voice Study Group. The Clearinghouse displayed its revised brochure and various bibliographies, as well as a plaster cast of the hand.

There are already a number of items to be considered for next year. As a result of planning for the Annual Meeting, a number of musicians and a representative from the Maryland State Dental Association have expressed interest in some sort of local mini-symposium. This may be a possibility for Fall 1990.

Music Medicine Clearinghouse Clips is an informal program started after conversations between Ms. Harman and Randall Campora, Players' Committee chairperson of the Baltimore Symphony Orchestra (BSO). The Clearinghouse will provide the BSO with a notebook containing several journal articles or other items related to music medicine to be placed in the players' lounge at the Meyerhoff. The items will be changed at a time interval to be mutually agreed upon. Ms. Harman delivered the first notebook in May.

The Clearinghouse will be listed in the *Directory of Special Libraries and Information Centers* and the *Clearinghouse Directory*, both 1990 publications from Gale Research, Inc. These reference books are bought by many libraries and should result in more publicity for the Clearinghouse. Ms. Harman is scheduled to give a paper on the Clearinghouse at the Special Libraries Association's annual conference in Pittsburgh during June 1990.

The possibility of a national database similar to that now under development in Europe is very exciting. Clearinghouse items could be included along with other information from many sources. In the meantime, the Clearinghouse bibliographies have become very unwieldy computer files. A librarian associated with the IAMA has offered to convert the files to a more suitable software program which would allow subject and date-of-entry access. This will require a large time investment, but nevertheless, must be considered a top priority.

Publicity efforts are still high on the agenda. News of the Clearinghouse is beginning to spread by word of mouth and the Coordinator's attendance at various meetings. However, a more formal publicity effort, directed at medical and music schools, orchestras,

medical and music organizations, medical and music libraries, etc., would result in more recognition.

Med Chi Past President George S. Malouf, MD (1984) accepts the new Past President's lapel pin from current President Raymond M. Atkins, MD at the Past President's luncheon.

Occupational Health

Mr. President and Members of the House of Delegates:

The Occupational Health Committee met four times during the 1989-1990 year to discuss areas related to occupational medicine.

The Committee continued its effort to obtain data from Workers' Compensation Insurance Carriers which provide information on the treatment of lower back pain. The Committee surveyed seven insurance companies and reviewed the data for possible guidelines for length of treatment for lower back pain.

The Committee also attempted to change regulations in the state code regarding Workers' Compensation, particularly in the areas of approval of treatment in a defined time frame for disputed treatment, and payment from insurance carriers to providers in a defined time frame.

The Committee sponsored a scientific session at the 1990 Annual Meeting of Med Chi on "The Physician As An Employer In The 1990s." Though attendance was limited, those participating showed much interest.

The Committee looks forward to the coming year and will strive to provide appropriate education to physicians and the public. The Chair appreciates the dedication of the Committee members and the Faculty staff.

Physicians visiting the technical exhibits stop to ask questions and request additional information about many programs and services.

Peer Review

Mr. President and Members of the House of Delegates:

During this past year the Peer Review Committee has met on a monthly basis. Committee members have devoted a great deal of time and effort to reviewing medical records, conducting site visits at physician offices, interviewing physicians during Committee meetings, and preparing detailed written reports of their peer review activities. The work of this Committee is reflected in the following statistics:

Cases referred by the Board of Physician Quality Assurance (BPQA)	97
Site visits	22
Medical record reviews	57
Completed reports to the BPQA	41

These figures do not include multiple cases which were referred to various component societies, specialty societies, and the Physician/Patient and Drug Committees of Med Chi.

This was the first year during which the review process followed the guidelines delineated in the newly developed *Peer Review Handbook for Maryland.*

Interested individuals in all specialties are encouraged to volunteer for peer review activities. Increased physician participation and involvement is needed at the local and state levels, as well as in specialty societies, in order to maintain the high standard of medical care in Maryland.

The Chairman wishes to express his gratitude to all Committee members for the long hours spent in Committee activities, to the various specialty consultants for their timely and expert opinions, and to Med Chi staff for their support and assistance.

Peer Review Management

Mr. President and Members of the House of Delegates:

The Peer Review Management Committee (PRMC) was established in June 1989 to be the oversight committee for the peer review process, as specified in the newly-developed *Peer Review Handbook*. Regular monthly meetings were held beginning in June. To fulfill its responsibilities, the newly-formed Committee is to perform the following duties:

1. Receive and record cases referred by the Board of Physician Quality Assurance (BPQA).
2. Identify the guidelines to be used in conducting the review.
3. Refer the case to the appropriate medical review committee.
4. Develop and maintain a monitoring procedure allowing the immediate determination of the status of any peer review complaint to ensure that the review is done in a timely manner.
5. Review reports received from investigating committees to determine their adequacy.
6. In the event a report is found to be inadequate, specifically identify the inadequacies in writing and return the report to the appropriate medical review committee.
7. When a report is adequate, transmit it to the BPQA.
8. When a final disposition report is received from the BPQA, forward a copy of it to the appropriate medical review committee.
9. Identify areas in which medical review committees need education and arrange to have the necessary education provided.
10. Provide organizational assistance to any medical review committee in Maryland, and poll components annually to determine the existence of medical review committees.
11. Periodically meet with the BPQA to decide what kinds of statistical information will be needed by the BPQA, the Faculty, and the component societies in evaluating and upgrading the review process.

The first priority of the Committee was the development of the *Peer Review Handbook*, a prototype that has already evoked the interest of groups in many other states. The *Handbook* has been approved and is now being distributed.

For the coming year, the Committee's focus will be on education. The first concern will be to assist all reviewing groups in Maryland to implement the guidelines described in the *Handbook*.

A second educational concern of this Committee is the fact that very limited options are given to the BPQA under the present system. The BPQA may take punitive action against the license of the physician under review or it may take no action at all. While some specific office practices may be found to be substandard, the overall practice may be of such quality that it is inappropriate to take action against the physician's license. However, the BPQA cannot insist upon any type of re-education unless action is taken against the physician's license. Often recommendations are made for re-review in the near future in the hope that improvement will have occurred. Subsequent reviews may not reveal marked differences from the initial review.

To maximize the value of the peer review process, the Committee recognized that a more ideal system would be to combine the information gathered in the peer review process regarding the deficiencies of a practice with a second phase of educational alternatives which would enable the physician to improve his/her practice habits. Thus, an educational subcommittee was created, under the Chairmanship of Ronald J. Cohen MD, to develop an educational program prototype. An initial plan has been completed for this project, and development will continue in the coming year.

The Chairman thanks every Committee member for the effort and support which has enabled this Committee to make a valuable contribution to the efficacy of the entire peer review process.

Physician/Patient Relations

Mr. President and Members of the House of Delegates:

The Physician/Patient Relations Committee has been very successful this past year in investigating complaints involving the standard of medical care, including Health Claims Arbitration cases and fee disputes. Cases are referred to this Committee from the Board of Physician Quality Assurance (BPQA).

After a professional expert in the particular field of medicine has examined the case completely, the Committee considers all the pertinent facts brought out in the investigation. After this deliberation, a recommendation is made and forwarded to the BPQA for a final decision.

The Physician/Patient Relations Committee prides itself on complete and fair investigations regarding the practice of medicine and related issues. This procedure opens the line of communication which supports and enhances the physician/patient relationship.

Committee members and staff are dedicated to the peer review process and are anxious to continue its enhancement for the improvement of the profession.

The Chairperson expresses her appreciation to all the Committee members and staff for their continued support of this process.

THE MEDICAL AND CHIRURGICAL FACULTY-*Physician Rehabilitation Committee*
The very definition of **ADVOCATE**

The Committee, in addition to being **CONFIDENTIAL** and **NONDISCIPLINARY**, acts as an advocate for physicians utilizing, in a cooperative atmosphere, the services of the Committee.

Areas of advocacy include matters of licensure, credentialing, and employment. Addiction, Marital/Family conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap... If these are some of the problems, we can help you find the solutions

In Maryland the Physician Rehabilitation Committee of MED-CHI is available to all physicians, and their families.
The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL.
If you, a colleague, or family member is in need of our services call:
(301)539-0872
In Maryland 1-800-492-1056
Message line (301)727-0120 24 hours a day, 7 days a week, leave a message

Medical and Chirurgical Faculty of Maryland

Physician Rehabilitation Committee

HELPING IS OUR BUSINESS...If you wish to help further the work of the Committee through a tax deductible donation send to: The Medical and Chirurgical Faculty Charitable/Educational Foundation, 1211 Cathedral St. Baltimore, Maryland 21201
Please note on your donation: "Physician Rehab"

Physician Rehabilitation

Mr. President and Members of the House of Delegates:

The Committee on Physician Rehabilitation has continued to expand its umbrella of advocacy by increasing the number of cases, enhancing services and improving the loan program.

During the past year, we have been in the process of upgrading and expanding the marketing strategies for the Committee. Since January 1989, the services of the Committee have been advertised in the *MMJ* each month. The November 1990 issue of the *MMJ* will be dedicated to the activities of the Committee; members of which are in the process of planning articles on impaired physicians. Other means of "getting the message out" continue to be explored and will be implemented as they become available.

The Committee has developed a pamphlet, *To Disclose or Not To Disclose*, as official Med Chi Physician Rehabilitation Program literature. The pamphlet will assist physicians in the Physician Rehabilitation Program when dealing with patients and colleagues regarding this sensitive issue. It will be distributed to participants in the Program and to other interested parties. Currently the Committee is in the process of developing another pamphlet, *Professional Treatment Never Includes Sex.*

Also developed, under an agreement with the Board of Physician Quality Assurance, was a telephone protocol for Committee members and staff. The guidelines in the protocol enable the person receiving an incoming call about an allegedly impaired physician, to make clear all the options which are available to the person making the referral.

In the past year, the Committee has developed and implemented a new expanded contract format for physicians under the advocacy of the Committee. It is used as a foundation when designing an individualized contract. All contracts are tailor-made according to individual needs and requirements in an effort to increase monitoring to allow maximal advocacy.

The Committee and staff are now using new letterhead designed for the Committee. It displays the Committee logo and announces the message line telephone number.

Cosponsored with Med Chi's Auxiliary was a raffle for a Bermuda vacation. The drawing for the vacation was held at Med Chi's 192nd Annual Meeting. A portion of the proceeds from the raffle will benefit the Physician Rehabilitation Program. The Committee also sponsored two educational programs at the Annual Meeting. Committee member, Robert M. Marine MD, spoke on "The Medical Aspects of Addiction" and Committee member, Edward J. Kowalewski MD, spoke on "Physician Character and Personality Traits That Predict Less Than Adequate Practice Standards."

The Committee loan program continues to improve and bad debt decrease as accounts receivable have increased. In April 1990, the Executive Committee voted to excuse $22,421.20 of bad debt as uncollectible since these loans were to persons who are now deceased, bankrupt or unable to pay due to disability. During the 1989-1990 Committee year, $10,080.15 in payments was received. Members developed a written protocol for physicians seeking financial aid from the Committee for the purpose of treatment.

Within the next year we look forward to utilizing a database to store information about the physicians under our advocacy. The Committee is also planning to develop a computerized billing system or the Committee loan program. In addition, the computer will be used to assist in tabulating statistics, enabling even better access to information for the purpose of program evaluation and communication.

The Physician Rehabilitation Program expects to grow and be of assistance to more physicians than ever, thanks to the passage of Senate Bill 138. This bill allows for funds from physician license renewal fees to be dedicated to the Physician Rehabilitation Program.

The Committee wishes to express its warmest sympathies to the colleagues, friends and families of Robert M. Ollodart MD, and Mauricio I. Zeplo MD, two valued Committee members who passed away in 1989. They have been and will continue to be sorely missed.

The Chairman wishes to express his regard for and appreciation to the hardworking and dedicated members of this Committee who continue to give unselfishly of their time to the important work of this Committee.

Policy and Planning

Mr. President and Members of the House of Delegates:

During the 1989-1990 operational year, the Policy and Planning Committee held two meetings. On July 12, 1989, the Committee proposed two issues for review and consideration with a subsequent report to the Faculty Council.

The issues recommended for review were:

1. The development of a Med Chi philosophy that would consider current and future socioeconomic factors impinging on the environment of medicine.
2. Improvement in communication among the membership, the House of Delegates, and the Med Chi Council.

To accomplish this review, the Committee organized itself into subcommittees to address each issue. Each subcommittee was to meet at the call of its Chairman and to report on the outlined goals when the full Committee met on August 16, 1989.

At the August meeting, Subcommittee A, which reported on "Improved Communications," proposed the following recommendations which were passed by the full Committee:

1. Minutes of Council, including the written Committee reports presented to Council, be sent to all Component Presidents and Executive Directors, and Council actions be clearly identified in the *MMJ*.
2. All pertinent available information related to the AMA (legislation, etc.) be dispatched as soon as possible to all Presidents and Executive Directors.
3. Current Med Chi procedure (i.e., Med Chi Presidents seek the advice of presidents of component societies in appointment of committee members) is acceptable and should continue.
4. The President-Elect should seek all possible input, including that of the components in the selection of committee appointments, so that appointments can be made in a timely fashion upon inauguration.
5. The preparation of a policy handbook should be investigated and a dollar amount determined for its development.

Subcommittee B, which reported on the "Development of a Med Chi Philosophy," proposed the following recommendations which were passed by the full Committee:

1. Formulation of an ad hoc committee to reach out to specific groups and target them for membership. The groups to be so targeted are: (a) academic MDs; (b) managed care and corporate medicine MDs (both full- and part-time); (c) female MDs; and (d) FMG MDs.
2. Consideration by Council, after a cost evaluation, of the hiring of an independent marketing company to survey the targeted groups to determine marketable membership strategies.
3. Direction by Council to the Student and Resident Societies to recruit new members. Involvement of the Deans of the medical schools in assisting with membership recruitment.
4. Creation by Council of an organized method, on a one-to-one basis, to re-recruit physicians who have left membership, and a procedure to insure that no further decline in membership occurs. It was further recommended that Council form an ad hoc membership committee comprised of component membership committee members. This ad hoc committee would establish guidelines for membership, as well as review the Bylaws for possible changes affecting membership.
5. Consideration by Council that the Bylaws Committee be requested to consider an attendance requirement for all Council members and possibly for all standing committee members.

The Committee had planned a meeting for January 31, 1990 but was unable to convene and the meeting was cancelled. The proposed agenda subject had been "Med Chi Trade vs Professional Organization."

Professional Ethics

Mr. President and Members of the House of Delegates:

The members of the Committee on Professional Ethics have been active in a variety of ways this past year in helping to educate the medical community about the ethical responsibilities pertaining to physicians, other healthcare practitioners, and the public.

During this past year, the Committee has revised ethical opinions related to termination of the physician/patient relationship, pronouncement of death, and laboratory referrals. Additionally, the Committee developed a new ethical opinion on the responsibility of physicians to patients under contractual agreements.

The Committee has been involved in updating the 1984 *Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.* Final approval by the Attorney General was granted in late April and distribution is expected in June. The *Compendium* will be presented in a format allowing for supplemental updates.

The Committee is currently developing an ethical position regarding euthanasia. Although much discussion is expected, Committee members agree that the issue should be addressed since the AMA has taken a position.

The Committee sponsored an educational program at the Faculty's Annual Meeting in May on "The Physician as Gatekeeper - A Professional Contradiction." The purpose of the panel was to discuss the responsibilities and ethical dilemmas faced by a physician in an HMO setting.

The Chairman would like to express his thanks to the members of this Committee who have devoted countless hours to the important work of this Committee.

Professional Review Organization Monitoring

Mr. President and Members of the House of Delegates:

The PRO Monitoring Committee exercised its responsibilities by maintaining close liaison with the federally designated Professional Review Organization, the Delmarva Foundation for Medical Care, Inc. Faculty members must clearly understand that Med Chi has no review power nor legal authority over the PRO, but does maintain a good working relationship with the Delmarva Foundation.

The Med Chi PRO Monitoring Committee met several times during this past year. The PRO began its third scope of work which has emphasized quality rather than utilization issues. The Committee had several discussions with Delmarva concerning physician notification in the State. It is our feeling that it is Delmarva's, and not Med Chi's responsibility, to notify Maryland physicians about new procedures or policy changes of the PRO.

During this year Delmarva set up a "peer review advisory committee" consisting of representatives from Delmarva, Med Chi, the Maryland Hospital Association, the Division of Licensing and Certification, the Health Facilities Association, and the Medical Assistance Program. We are aware of only one meeting that took place this past year.

The issue of confidentiality has once again been raised; especially with regard to psychiatric records. The Committee has been reassured by Delmarva that it does have adequate protection of the records from a confidentiality point of view. Delmarva has produced an information pamphlet for physicians dealing with its policies and procedures. The Committee felt that the information contained was appropriate and useful for practicing physicians in Maryland.

During this year, our Committee also reviewed the medical records of several patients sent by physicians who have complained about actions taken by Delmarva. Committee members reviewed the charts and then responded to the physicians concerning the appropriateness of Delmarva's actions. There have been discussions in our Committee and at Council about complaints from physicians dealing with the quality of the letters they are receiving. Many are apparently inappropriate. We have notified utilization review offices in Maryland hospitals to attempt to gather information about these questionable Delmarva letters. We would like to know how many such letters they are sending out.

The Medical Society has also gone on record this year as being strongly opposed to the office-based review of physicians that Medicare is instituting in several states.

Public Health

Mr. President and Members of the House of Delegates:

During the 1989-1990 year, the Committee on Public Health continued to exercise its charge to review Med Chi's existing committee structure as it relates to public health and to develop recommendations to improve Med Chi's effectiveness in managing public health issues.

This year, the Committee was, to a large extent, concerned with the development of two white papers on "Cholesterol Testing" and "Problems of the Uninsured." These subjects were considered on August 7, 1989 by the Committee, and subsequently expanded by ad hoc members. In addition, the report of an ad hoc committee of the Faculty Council on "Employee Health Insurance Coverage" was presented. Dr. Ted Lewers, a member of the AMA Subcommittee on the Uninsured, added his expertise to our final formulation.

The white paper, "Problems of the Uninsured," was presented by Dr. Herman Maganzini at Med Chi's Semiannual Meeting on September 1, 1989. On November 1, 1989, the Chairman participated in a panel, "Medically Uninsured: Health Coverage Initiatives for the 1990s," at the Ninth Annual Maryland Convocation. The co-panelists were Dr. Lonnie Bristow (AMA Trustee) and the Honorable Donna M. Felling (State Delegate).

Both white papers were published in the January 1990 issue of the *Maryland Medical Journal.*

Final bylaw changes concerning this Committee were passed at the Semiannual Meeting. These defined a "Liaison Committee with the Medical Assistance Program" to deal with the Department of Health on all matters pertaining to the Medical Assistance program. The Committee on Public Health, with its four subcommittees (Child & Adolescent Health and Welfare; Immunology and Infectious Diseases; Maternal Health and Welfare; Sports Medicine), was charged with all other interactions with local, state and federal agencies, as well as any other interested parties.

On December 6, 1989, the Committee met with physicians from East Baltimore concerning their problems with the Municipal Health Services Program. Recommendations were made to Council and the Baltimore City Medical Society.

Also in December, the Committee became involved with hearings of the Maryland Health Resources Planning Commission pertaining to cardiac surgery and therapeutic catheterization in certain Baltimore City hospitals. We were able to establish contact between the Maryland Society of Cardiology and certain members of the Technical Advisory Group (TAG) which had presented recommendations to the Commission.

Many other questions were referred to this Committee by physicians, other committees and Council, and all were either referred to appropriate subcommittees or considered, and action taken.

On March 17, 1990, the Chairman moderated a symposium on "Child Abuse" sponsored jointly by Medical Mutual and Med Chi.

Our final meeting of this year was March 12, 1990 at which we considered the problem of an application to the FDA to allow advertising of prescription drugs on television. While investigating the problem, we were informed by the FDA that because of ongoing objections the application was withdrawn. Finally the "Health Access America" initiative of the AMA was considered. This Committee will coordinate this effort in Maryland.

Public Relations

Mr. President and Members of the House of Delegates:

The Public Relations Committee began its 1989-1990 session by proposing an amendment to the Committee's Bylaws that would include "enhancing the image of the physician" as a primary function of the Committee. Throughout the rest of the year, the Committee initiated several new programs in an effort to achieve this goal.

To improve the physician's image in the eyes of the public, one of the Committee's first projects was to encourage proactive media relations. The Committee actively supported President Dr. Raymond M. Atkins' "white paper" project and proposed a plan to publicize the Faculty's position on key legislative issues to the media. Although only Med Chi's President can act as the official spokesperson for Faculty Positions, the Committee helped publicize Med Chi's position on important legislative issues such as Triplicate Prescriptions.

On the national level, before Expenditure Targets (ETs) had become a significant issue in Congress, the Public Relations Committee was charged with informing Maryland physicians about this potential threat to the availability of healthcare for senior citizens. The campaign to defeat this legislation had three primary goals: 1) To persuade all Maryland U.S. representatives to oppose ETs; 2) To inform all Med Chi members about ETs and encourage physicians to contact their congressmen; and, 3) To inform senior citizens in Maryland about ETs and encourage them to contact their congressmen. The Committee's extensive awareness campaign spanned four months and

included several letters to Maryland representatives, five informational flyers for physicians, and letters to all Maryland senior centers. Thanks to the outstanding cooperation of Med Chi's Component Societies and the Auxiliary, Representatives C. Thomas McMillen and Constance A. Morrella took positions opposing ETs. As a result of this support, the ETs proposal was defeated.

Following this defeat, the Committee surveyed Med Chi's House of Delegates on the effectiveness of the ETs campaign which showed that 97 percent of the Delegates surveyed rated the Committee's job as good to excellent in informing the membership about ETs.

The results of the ETs survey showed the Committee that the *Maryland Medical Journal* (*MMJ*) is an excellent source for Med Chi news and information. To promote the *MMJ* to the membership, the Committee created several informational flyers that were distributed at the Med Chi Annual Meeting in May.

During the Annual Meeting, the Committee presented a session on "Practical Techniques for Promoting Your Medical Practice," to teach physicians ways to build and maintain their patient base, enhance their practice and develop long-term plan goals. In addition to this session, Committee members cooperated to produce "Patient Relations: A Prescription for Good Service," a slideshow designed to remind physicians of basic patient relations techniques that will help improve physician/patient relationships.

In addition to its new projects, the Committee continued producing two radio programs for Med Chi physicians. "Consultation, with John Stupak," Med Chi's nationally aired call-in show, is now heard on over 30 radio stations across the country. Subjects discussed on the national program include AIDS, Nutrition, Cancer, Sports Medicine and Headaches. In addition, a local version of "Consultation" continues to air on WBAL-AM radio on Sunday mornings at 7:00 a.m..

In an effort to encourage speakers to participate in the radio programs and to persuade physicians to speak to public groups, the Committee ran monthly advertisements for "Consultation" and for Med Chi's Speaker's Bureau in the *MMJ*. Over 45 physicians currently participate in the Speaker's Bureau and help Med Chi respond to requests from the public and the media for information on their specialty or topic.

The Committee also continued all of its awards programs including the Med Chi First Annual Award for Excellence in Organized Medicine. The award was created to encourage medical students' involvement in organized medicine and to increase Med Chi's visibility at Maryland's medical schools. The award, which recognizes the contributions Maryland medical students make to organized medicine, was presented to Jay W. Floyd, a senior at the University of Maryland.

The Public Relations Committee also sponsored the Tenth Annual Photo Contest. Faculty and Auxiliary members entered over 20 photos which were judged by J. Preston Birckner, a professional freelance photographer from Baltimore. Winners were announced during the House of Delegates Session of the Annual Meeting. A. Harry Oleynick MD won first and second place, and David A. Paul MD won third place. All entries in the photo contest were on display during the Annual Meeting.

Certificates of Recognition were presented during the House of Delegates Session of the Annual Meeting to three physicians for their outstanding service and dedication as chairmen of Med Chi committees. President Raymond M. Atkins MD presented certificates to Victor R. Hrehorovich MD, Chairman of the Committee on Hospital Medical Staffs; Louis C. Breschi MD, Chairman of the Committee on Professional Ethics; and Herman C. Maganzini, Chairman of the Committee on Public Health.

Wayne C. Spiggle MD, winner of the A.H. Robins Award for Community Service, also was announced during the Annual Meeting.

The Public Relations Committee's goal is to create the best possible image for Maryland physicians in the eyes of the public. The Committee welcomes comments and suggestions from Med Chi members regarding its activities. As Chairman, I thank the members of my Committee whose time and effort have made this a productive year.

Scientific Activity

Mr. President and Members of the House of Delegates:

The Committee's deliberations this year have included numerous items and events.

A revised policy regarding cosponsorship applications was developed by the Committee and submitted to Council for approval. At the November meeting, Council approved the recommendations and the Committee has implemented the policy with all applications for cosponsorship.

The 1989 Semiannual Meeting was held at the Sheraton Ocean City Resort & Conference Center, September 14-16, 1989. The more than 125 registrants were able to select from 17 scientific programs which covered a full range of topics of current interest to our membership.

The 1990 Annual Meeting was held at the Turf Valley Hotel and Country Club in Ellicott City, May 9-11, 1990. Highlights of the program included a plenary lecture on "Healthcare Financing: An American Solution," by AMA Trustee Lonnie Bristow MD. A Theme Symposium was moderated by Donld T. Lewers MD. Outstanding speakers included Thomas Reardon MD, Commissioner from the Physician Payment Review Commission, addressing the topic of "Physician Payment, Potential Changes: Issues and Answers." Palma Formica MD spoke on "Long-Range Plans and Expectations." AMA experts, Ross Rubin Esq., John Seward MD and John Zapp DDS, gave detailed presentations on critical issues pertaining to "Legislative Affairs," and Congressman Benjamin L. Cardin (D-MD) addressed the topic "Federal Legislative Issues in the 1990s."

The Capstone Lecture was presented on Friday by Victor A. McKusick MD, Professor of Medical Genetics, Johns Hopkins University School of Medicine. Dr. McKusick addressed an audience of well over 150 on the topic of mapping genes on chromosomes and the Human Genome Project.

Over 600 physicians attended the 192nd Annual Meeting. A total of 41 scientific sessions were presented and afforded registered physicians an opportunity to earn up to 12.5 hours of Category One CME credit.

The next Annual Meeting is scheduled to be held at the University of Maryland Conference Center, College Park, Maryland, on May 8-10, 1991.

The Committee on Scientific Activity wishes to express its deep appreciation to all those who contributed to making this year's programs, meetings and activities so successful and worthwhile.

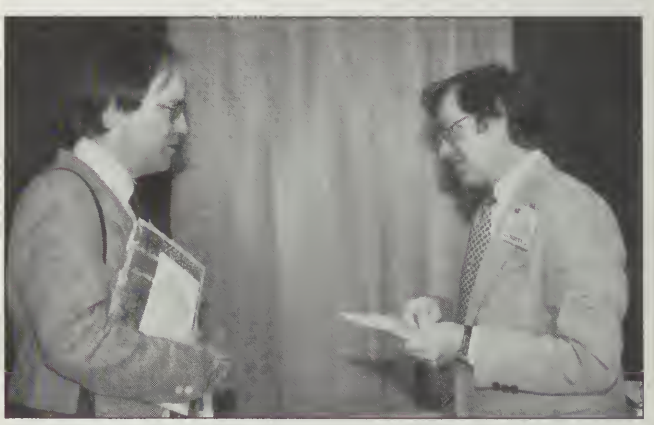
Small Area Practice Variation

Mr. President and Members of the House of Delegates:

The Committee on Small Area Practice Variation met three times since our last report. Issues brought to the Committee's attention are as follows:

Dr. Arthur Keefe presented the initiatives being taken by Blue Cross and Blue Shield to explain small area practice variations. Dr. Harrold Elberfeld, Chairman of the Med Chi Subcommittee on Maternal Welfare, discussed the efforts of our Committee and the Maryland Hospital Association to explain variations in C-section rates and modify them where appropriate. Dr. Elberfeld and his Subcommittee are following up by working with local obstetricians.

Dr. Thomas Gadacz reported on his research into variations in Carotid Endarterectomy and proposed that we work on this next year.



Dr. H. Logan Holtgrewe discussed the American Urologic Association's national initiative to explain and modify variations in prostatectomy rates.

In addition, Drs. Vahe Kazandjian, Leonard Scherlis, and Peter Dans published an article in the *Maryland Medical Journal* to educate physicians on the subject of small area practice variations.

As was done last year, a panel presentation was held at the Annual Meeting to acquaint physicians further with public policy implications of small area practice variations.

Specialist Identification

Mr. President and Members of the House of Delegates:

The Committee on Specialist Identification met six times during the past year to carry out its function as the reviewing body for the Board of Physician Quality Assurance (BPQA) in the area of Specialist Identification. During this past year, 309 applications were evaluated by the Committee with recommendations to the Board of Physician Quality Assurance.

Application for specialty designation is legally required for all licensed physicians in Maryland. If a physician is certified by the American Board of Medical Specialists, the identification is automatically given by the Board upon confirmation of that credential. If not certified by the American Board of Medical Specialists, the physician must complete an application outlining specific training and experience in the requested specialty.

Each application is reviewed thoroughly, fairly, and in compliance with established criteria. Liaison is maintained with the Board of Physician Quality Assurance members John Lynn MD and Claude Hill MD, who represent the Board for Specialist Identification.

On behalf of the Committee on Specialist Identification, I extend my appreciation to each member for his or her valuable time and effort in this very important activity.

Specialty Societies

Mr. President and Members of the House of Delegates:

The Committee on Specialty Societies is dedicated to the review of issues concerning interdisciplinary and multidisciplinary problem areas of medical practice as they relate to each specialty. The Committee provides specialty representation on the Faculty Council and House of Delegates.

This Committee, originally formed as an ad hoc committee, conducted its first meeting on August 31, 1989. At that meeting, the Committee reviewed its charge and the manner in which representation on the Committee was determined. The Committee discussed specialty society involvement with peer review and with legislative issues, and a member was selected to represent the Committee on the Faculty Council.

At its second meeting on October 26, 1989, the Committee selected six of its members to represent the Committee on the House of Delegates. The Committee again discussed peer review activity and policy at each specialty society, and asked the specialty societies to identify contact persons for peer review.

During its January meeting, at which the Committee appointed a seventh Delegate and four Alternate Delegates to the House of Delegates, the Committee's value to the Faculty, Specialty Societies, and the practice of medicine became clearly evident. The Committee became actively involved in deliberations with the Medicare Medical Director and provided recommendations concerning proposed revisions of Medicare policies for the reimbursement of GI endoscopies and non-invasive vascular testing. The Committee's recommendations were enthusiastically accepted by the Medicare Medical Director.

At the Committee meeting of March 22, 1990, the Committee reviewed its input to the revisions of Medicare policies related to GI endoscopies and non-invasive vascular testing. The Committee also became involved in the issue of psychiatric managed care and utilization review which the Task Force on Psychiatric Managed Care has been evaluating for the purpose of providing appropriate psychiatric utilization review guidelines.

Women in Medicine Ad Hoc

Mr. President and Members of the House of Delegates:

Med Chi formed the Ad Hoc Committee on Women in Medicine in January 1989 to study the professional and personal goals of women physicians and to develop programs to improve opportunities for women in medicine to attain these goals.

At present, the primary goal of this Committee is to increase women's membership in Med Chi and encourage women physicians to become actively involved in organized medicine at all levels (county, state, and national). In April 1989, the House of Delegates passed a resolution that Med Chi "actively recruit women members" and the Faculty "encourage women to actively participate in organized medicine through increased committee and other leadership involvement." To help carry out this resolution, the Committee sponsored two receptions for women physicians, during the Semiannual Meeting in September 1989 and during the Annual Meeting in May 1990. These receptions are intended to encourage nonmember women physicians in Maryland to participate in organized medicine.

In September 1990, the Committee will participate in the AMA's "Women In Medicine Month" by inviting nonmember women physicians to the Faculty to discuss problems unique to women physicians and to determine ways organized medicine can help solve them.

Another major goal of the Women in Medicine Committee is to increase the availability of child care facilities for working women. The Committee is formulating solutions for a new type of child care that will be convenient, safe, flexible, readily available, and close to the workplace so parents may spend more time with their children to the benefit of the parents, their children, and their profession.

Other goals of the Committee include support and social groups for women physicians, seminars to help women function with job/family stress, and a round table discussion of women physicians and medical students to discuss various women's issues perceived to be unique to working women.

The members of the Women in Medicine Committee thank Med Chi for the opportunity of serving on this Committee. We welcome any comments or suggestions for future activities from all physicians. In this exciting and changing medical atmosphere, we physicians must work together, cooperating for the excellence of our profession now and in the future.

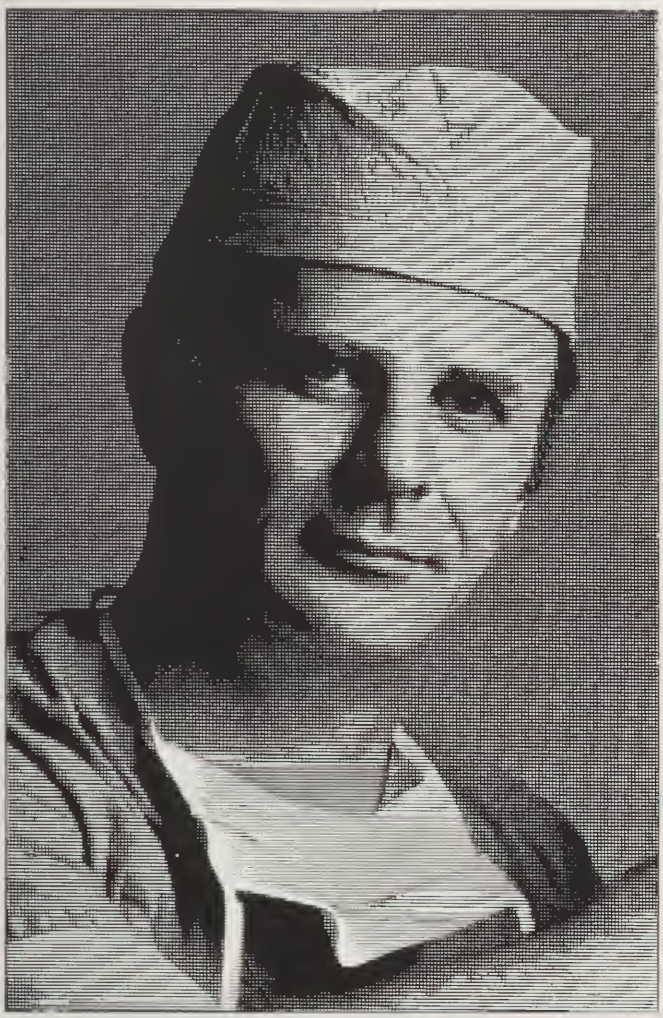
Young Physicians

Mr. President and Members of the House of Delegates:

The Committee continued to work actively to develop programs and encourage the participation of young physicians in Med Chi and its component societies. By definition, young physicians are licensed physicians under age forty or in practice less than five years.

The Committee reaffirmed its goal to strengthen the Medical and Chirurgical Faculty through increased membership by young physicians, and witnessed an increase in Committee membership from the previous year.



The survey conducted by the Committee to obtain demographic information and assess priorities of young physicians in Maryland was completed. The data will be used as a tool to recruit new members and to plan educational activities for young physicians.

For the second year, a young physician's social gathering was held at Med Chi's Annual Meeting. Also at the Annual Meeting, the Committee sponsored a session on "How to Improve Your Practice Management Results".

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

Baltimore, MD 21215-0095
Telephone:(301)764-4777

Medical Specialty Identification

The Board of Physician Quality Assurance has adopted COMAR 10.32.09 Identification of Medical Specialties, in order to implement Health Occupations Article 14-704, which provides for the identification of medical specialists by the Board. **A physician may not represent to the public in Maryland that he is a specialist in any field of specialized medical practice unless identified as a specialist in that field by the Board.**

There are two ways to become identified as a medical specialist. They are:

A. Specialty Board certification.

If you qualify as a medical specialist because of specialty board certification, please enclose a $5 fee for each specialty requested and a photocopy of your certification.

B. Evaluation of credentials by a Medical Review Committee.

If you are not American Board of Medical Specialties (AMBS) specialty or subspecialty board certified but wish to be credentialed as a medical specialist in any field of medicine through evaluation of credentials, education, and experience, please enclose a $15 evaluation fee plus a $5 identification fee for each specialty requested). The evaluation form will then be sent to you.

AMA-ERF

Mr. President and Members of the House of Delegates:

As State Chairperson AMA-ERF, I am pleased to present the report of Faculty Members' contributions for the year 1989-90.

You will please note that through the courtesy of the AMA-ERF Foundation, also displayed are the direct contribution figures of Maryland physicians for the calendar year 1989. By way of clarification, the national figures represent funds that have not passed through my hands, but were mailed directly to National; not necessarily by Faculty members.

The loyal and generous financial support of our "Medical Family" through AMA-ERF is an important stepping-stone to achieving medical excellence in our medical schools. Not all of the contributions listed are returned for use at the University of Maryland and Johns Hopkins Medical Schools, but rather, are distributed according to the contributor's designation.

It has been a privilege to serve as AMA-ERF Chairperson for the Faculty during 1989-90; one for which I offer my sincere thanks.

To those Faculty members who have staunchly supported AMA-ERF, I extend my heartfelt thanks to each and all.

AMA-ERF Chairperson Elizabeth A. Linhardt promotes her exhibit to raise funds for medical student scholarships.

Faculty Contributions
June 1, 1989 - April 30, 1990

Allegany County	$560.00

Elizabeth A. Linhardt, State Chairperson

Auxiliary

Mr. President and Members of the House of Delegates:

This past year has been a very productive one for our Auxiliary. I was able to visit the counties and to witness the involvement and dedication of our members who participated in so many worthwhile projects. I particularly enjoyed meeting our members who were unable to come to state meetings and to see first-hand what resulted from their involvement with our group. Our counties participated in numerous community projects. Among other things, Wicomico County presented AIDS' programs to school children; Washington County conducted ElderLove, a support group for caregivers of the elderly; Prince George's County provided CPR classes; Montgomery County created and donated the "Health Yourself" collection to the Health Information Center of the public libraries and presented "Health Yourself" programs to school children; Howard County was very involved in a therapeutic riding program for the disabled; Harford County worked with a nursing home and made lap blankets for the residents; Frederick County, with the aid of Organ Annie, put on programs at several different schools; Baltimore County worked with a homeless shelter; Baltimore City worked to provide healthcare for the homeless; Anne Arundel County put on a senior health fair; and Allegany County took a healthy snacks program into its schools. These are

only a sample of the county programs. There are far too many to list. However, I would like to mention our Organ Annie dolls. These are soft sculptured dolls with removable organs used to teach children about their bodies. All of our counties are using Organ Annies in various programs and recently Organ Annie found her way to the White House. Our first lady is now the owner of an Organ Annie doll donated by the Montgomery County Auxiliary. After receiving her doll, Mrs. Bush had very flattering comments to make about both the Organ Annie program and the Auxiliary. In addition to the community programs, each county also worked to raise funds for AMA-ERF. Together with faculty contributions, the Auxiliary raised approximately $55,000 for AMA-ERF.

We have been involved in many areas, however, our major emphasis this year was two-fold -- legislation and child abuse.

Legislation being a major concern to all of us, we committed to doing whatever we could to become a meaningful voice in legislative matters pertaining to medicine and to the common good of our communities. We spent a great part of the year working in this regard and educating our members as to the part they can, and should, play in the legislative arena. We organized a "Day in Annapolis" to learn more about state politics and to further make our presence felt by many of our state legislators. We also participated in Med Chi's statewide legislative rally where we again had the opportunity to meet with our state representatives. On the national level, we participated in a multi-state conference on legislation in Washington, DC, offering us the opportunity to interact with neighboring state auxiliaries and to meet with our congressional representatives. The guest speaker at our Fall House of Delegates meeting was Congressman Tom McMillan. Congressman McMillan has been labeled a "friend to medicine" and it was good to have the opportunity to discuss legislation with a congressman who shares many of our concerns. We have had legislative updates at all of our meetings by our legislative chairperson and we have also had updates at various times by both AMPAC and MMPAC. When there has been a need, we have conducted phone and letter campaigns pertaining to specific bills, and whenever given the chance, we have voiced our concerns in person to our representatives. We met with Governor Schaefer, and we were presented a proclamation by Maryland's House of Delegates in recognition of our efforts toward the betterment of medicine. We are aware of the importance of legislative reform, and we have demonstrated our ability to be an influence.

Our work with legislation is not something that will end with my year, as it is not something that began in my year. Legislative reform will continue to require our involvement, both as concerned citizens and as members of the medical community. We recognize that the more knowledge we gain and the more our presence is felt, the better able we will be to have an impact on legislation.

Our other area of emphasis this year has been on the fight against child abuse. Child abuse, one of our society's most devastating problems, leaves in its wake helpless victims who need our support desperately. We asked the chairperson of our National Health Projects Committee to address this topic at our House of Delegates meeting and her speech further increased our awareness of the severity of this problem. In response to this situation, our counties participated in various programs educating the public and offering aid to child abuse victims and their families. We also raised funds to be used for work in this area. In addition to the funds raised by each county, the State Auxiliary donated $5,000 to this effort.

The prevention of child abuse has always been a special concern of mine, and I am very pleased and proud of what our Auxiliary has done in this regard. Our members have once again demonstrated their compassion and willingness to work for the benefit of others, and we have received recognition for this. The Chairman of the Board of Parents Anonymous, a national group that works for the prevention of child abuse and with treatment programs, wrote to commend us on our efforts and to express his encouragement and support. We also received communication from the Executive Director of the Chesapeake Institute, another organization that works with abused

Outgoing Auxiliary President Victoria E. Cameron and Incoming Auxiliary President Josefina D. Figueroa await entrance to the Auxiliary Board Meeting.

children. It is certainly rewarding to be involved in such meaningful work, and it is also nice to know that others recognize our efforts.

Another goal that we achieved this year is the formation of a new county auxiliary. At the start of the year we noted that several counties in Maryland did not have auxiliaries. We decided to approach them in an attempt to establish auxiliaries. In a time when volunteer groups all over struggle for members, I am happy to announce that we have added a new county to our organization; Kent County officially organized this year. They are an enthusiastic group and add much to our Auxiliary. In addition to Kent, we are working to organize other counties and it appears as though Calvert County may be joining us soon. It is encouraging to know that with all the different outside interests people have and with the limited time they have to devote to volunteer groups, we are still able to form new county auxiliaries and add these people to our membership.

For the first time in our history, one of our members will also be the President of our Medical Society; Dr. Reynaldo Lee-Llacer, the new President of the State Medical Society, is a physician married to a physician. His wife has been a member of our group but he has not, although he has the same eligibility as she has. This year he joined the Auxiliary, making him the first auxilian to be the President of Med Chi.

Med Chi has always been very supportive of the Auxiliary and proud of our accomplishments. We serve on several Medical Society committees and we have been treated as valued members of those committees. I have particularly enjoyed my involvement with the Committee on Scientific Activity. In addition to those on which we currently serve, we have recently been asked to fill a position on Med Chi's AIDS Committee which we will do in the upcoming year. Besides our committee involvements, we have also worked with the Medical Society on legislative matters. Med Chi has demonstrated a respect for us as a group and as individuals and we are very appreciative of the relationship we have enjoyed with the Medical Society.

This last year is a year I will never forget. Being President of Maryland's Auxiliary has meant so much to me and this is because of the respect I have for the people who elected me and with whom I have worked. While representing the Auxiliary, I have met some remarkable people but I can assure you, there are none better than the people in the Auxiliary. This has been a most memorable time in my life and it has truly been an honor to serve as President of the Auxiliary to the Medical and Chirurgical Faculty of Maryland. I look forward to many more years with the Auxiliary and know there is no end to what we can accomplish working together on the issues that concern us.

Victoria E. Cameron, President 1989 - 1990

Delegation to the AMA House of Delegates - 1989 Interim Meeting

Mr. President and Members of the House of Delegates:

The AMA House of Delegates met in Honolulu, December 3-6, 1989. This was a very busy meeting, with 187 resolutions and 79 Board and Council reports to consider. The House took positions on some far-reaching issues of vital importance to the practicing physician.

There were 435 delegates seated. The House composition is:

347 delegates representing state medical associations
78 delegates representing national medical specialty societies
10 delegates representing medical students, resident physicians, hospital medical staffs, young physicians, Army, Navy, Air Force, USPHS, and the Veterans Administration

Address of the President Alan R. Nelson MD, AMA President, declaring that "the AMA works," cited an impressive list of accomplishments as an answer to the proverbial question, "What does the AMA do for me?" He included:

- the defeat of mandatory assignment four times in the past three Congresses
- the fact that the AMA is the world's largest publisher of scientific information
- the defeat of expenditure targets in the budget bill
- the AMA's commitment to NIH funding to protect the stability and integrity of medical research in the U.S.
- the AMA's considerable activities in communicating medicine's story to the public
  - weekly news releases to 3,000 reporters
  - meetings with editorial boards
  - American Medical Television reaches over 50,000 physicians and 800,000 lay people each month
  - American Medical Radio News is used by 500 radio stations daily

Dr. Nelson urged the nation's physicians to get involved and join the AMA as "your best investment in the future." He expressed concern that "the frustration and disillusionment being expressed by physicians in America will lead them to throw up their hands in despair rather than raise up their arms in support."

Lauro F. Cavazos PhD, US Secretary of Education Dr. Cavazos addressed the opening session of the House of Delegates. A former medical school dean, Dr. Cavazos declared that "our medical schools are at the forefront of curricular innovation and continue to attract the finest students." He credited the AMA with playing "an essential role in assuring that educational quality is maintained."

(l to r) J. David Nagel, MD; Donald T. Lewers, MD; Congressman Benjamin Cardin (D-MD); and Raymond M. Atkins, MD pose for a photo during a break in the theme symposium.

Dr. Cavazos called on the delegates for assistance in improving and restructuring our nation's system of education. He said, "without a well-educated citizenry, the United States is in danger of becoming what has been described as the world's only fully industrialized third-world nation."

Dr. Cavazos called for major restructuring of the nation's educational system to provide:

- early childhood education
- safe, drug-free schools for all of America's children
- support for teachers from physician volunteers

AIDS The House approved a major policy update on the medical, legal, and social implications of AIDS and HIV infection. The Board report addressed a number of issues related to education, research, national policy, financing media coverage, and the prevalence and incidence of AIDS:

- recommended contact-tracing and notification of needle partners
- recommended that the AMA Council on Medical Service study the cost of care for patients in each stage of HIV infection and estimate the number of people in each stage now and in five years.
- pledged ongoing support for funding for research, education, and patient care, as well as for alternatives to inpatient care.
- vowed to work with other physician groups, public health officials, and universities to advance training for primary care MDs and specialists.
- encouraged MDs to provide information to patients about HIV prevention and to become more involved in the care of HIV-infected patients.
- endorsed institutional indemnification of medical students and resident physicians infected as a result of patient contact.
- said AMA would consult with appropriate federal agencies and drug manufacturers about the expansion of AIDS drugs.
- urged MDs to take comprehensive and thorough sex and drug histories in a non-judgmental fashion.
- asked federal and state agencies to establish rigorous proficiency testing and quality control procedures for testing labs frequently and regularly.
- reaffirmed its commitment to mandatory testing of inmates in federal and state prisons and supported mandatory testing of all newborns in high prevalence areas.

In other AIDS-related actions, the House:

- encouraged state legislation to establish requirements for reporting and case follow-up for serious contagious diseases, including HIV infection.
- requested that the Food and Drug Administration address the problem of readable instructions for condoms.
- recommended that the FDA not allow home test kits for HIV.

Drug Abuse in the United States The House considered a Board report and several resolutions related to drug abuse. The report states that America's drug epidemic has evolved in recent years from an urban plight to a national crisis. The Board pledged its continuing involvement in programs to alert physicians and the public to the dimensions of the problem and the most promising solutions. The report recommended that the AMA:

1. Cooperate in activities of organizations such as the National Association for Perinatal Addiction Research and Education (NAPARE) in fostering education, research, prevention, and treatment of maternal drug and alcohol use.
2. Encourage the development of model alcohol and drug treatment programs, complete with an evaluation component, that are designed to meet the special needs of pregnant women through a comprehensive array of essential services.
3. Urge physicians to routinely screen all pregnant women and those of childbearing age for drug and alcohol use, and to follow-up positive screens with appropriate interventions and referrals.
4. Pursue the development of educational materials for physicians and the public on prevention, diagnosis, and treatment of perinatal addiction. In this regard, the Board encourages further collaboration with the Partnership for a Drug-free America in delivering appropriate messages to health professionals and the public on the risks and ramifications of perinatal drug and alcohol use.
5. Urge the National Institute on Drug Abuse, the National Institute on Alcohol Abuse and Alcoholism, and the Federal Office for Substance

Abuse Prevention to continue to support research and intervention strategies.

6. Urge that public policy be predicated on the understanding that alcoholism and drug dependence are diseases characterized by compulsive use in the face of adverse consequences.
7. Affirm the concept that substance abuse is a disease and develop model legislation to appropriately address perinatal addiction as a disease, bearing in mind physicians' concern for the health of the mother, the fetus, and resultant offspring.
8. Call for better coordination of research, prevention, and intervention services for women and infants at risk for both HIV infection and perinatal addiction.

In a related action, the House adopted a resolution entitled "Substance Abuse as a Public Health Hazard," that called upon the AMA to:

- recognize that substance abuse is the major health problem in the United States today and that its solution requires a multifaceted approach.
- declare substance abuse its number one public health priority.
- take a positive stance as a leader in matters concerning substance abuse.
- study innovative approaches to the elimination of substance abuse dependencies and their resultant street crime, including approaches which have been used in other nations.

Prevention of Drunk Driving The House adopted a resolution introduced by the Young Physicians Section that addressed the issue of the involvement of alcohol as a leading cause of morbidity and mortality in motor vehicle accidents. The House voted to:

- encourage state medical societies to urge their state legislators to adopt a blood alcohol level of 0.05 percent as per se illegal for driving.
- work with Congress to make federal highway funds to states contingent upon state adoption of a blood alcohol level of 0.05 percent as per se illegal for driving.

Frozen Pre-embryos The House approved a report that discusses the legal and ethical issues created by the freezing of human pre-embryos and offers guidelines as to the rights of the gamete providers and the disposition of the pre-embryos.

ABMS Yellow Pages Listing The House adopted a resolution introduced by the District of Columbia Delegation that called upon the AMA to:

- urge the American Board of Medical Specialties (ABMS) to abandon the entrepreneurial endeavor of placing display advertisements in the major Yellow Pages telephone directories where board certified specialists are located.

Theme Symposium speakers (l to r) John Zapp, DDS; Ross N. Rubin, Esq.; Palma E. Formica, MD; John Seward, MD; and Thomas Reardon, MD prepare to address Maryland's physicians on "What to Expect in the 1990's."

- insist that truth-in-advertising demands that ABMS state to all callers that its display listings may not represent a complete listing of all board certified specialists.

Health Insurance Coverage for the Uninsured The House adopted a resolution that addressed the problem of having an estimated 37 million Americans without health insurance. Introduced by the American Academy of Family Physicians, the resolution called upon the AMA to reaffirm its support for ensuring access to healthcare for the uninsured:

- through various combinations of employer-sponsored coverage.
- other private approaches such as risk pools and the AMA proposed restructuring of Medicaid and Medicare programs.

Dependent Uninsured Coverage In a related action, the House approved a resolution, introduced by the Hospital Medical Staff Section, calling for an AMA study of the health insurance coverage for the uninsured "dependent" population.

Billing for Cross-coverage A number of resolutions addressed physician dissatisfaction with the practice of Medicare, Medicaid, and most private payors to not allow practitioners to bill for services provided by covering physicians.

The House approved a policy calling on the AMA:

> to pursue all appropriate legislative, regulatory, and administrative means to amend or eliminate the inappropriate enforcement of the Social Security Act and/or Medicare regulations in order to make it possible for physicians in solo or group practice to bill and receive payment for professional services to their Medicare patients rendered by colleagues who provide them with traditional short-term coverage.

Funding for the AMA's Physicians' Assistance Program Several state delegations cosponsored a resolution asking the AMA to continue to adequately fund and maintain an impaired physicians' program or "Physicians' Assistance Program." The resolution which was adopted as amended, directed that the charge of the program will include, but not be limited to:

- promoting state medical society impaired physician programs and medical student impairment programs.
- providing technical assistance to state programs.
- conducting scientific and socioeconomic research.
- hosting an annual conference to share research and exchange ideas on the field of physician impairment.

Resolutions Submitted by Maryland Delegation

Gun Control - Resolution #34

RESOLVED, That the American Medical Association use its influence in matters of health to effect passage of legislation in the Congress of the United States mandating a national waiting period that allows for a police background and positive identification check for anyone who wants to purchase a handgun from a gun dealer in our country.

House Action: Adopted, as amended.

Use of Insecticides - Resolution #35

RESOLVED, That the American Medical Association, at once and with the greatest vigor, bring before the members of the Congress of the United States our urgent request to curb the inappropriate and unsafe use of insecticides, fungicides, and other chemicals used to improve or alter the growth of fruits and vegetables; and be it further

RESOLVED, That the safety of these and any other chemicals used in the future be proved before they may be introduced into the food chain.

House Action: The House adopted the Reference Committee's recommendation that Resolution 101, "Effects of Pesticides," be adopted in lieu of Resolution 35. Resolution 101 asks that the AMA urge Congress, the EPA, and other responsible state and federal regulatory agencies to determine the effects of pesticides on humans.

Support for Improvement of the Health Environment in Developing Countries - Resolution #36

RESOLVED, That the American Medical Association take all possible action to:

1. Encourage Congress to express a strong and clear commitment to continue the promotion of measures to improve child survival and development through long-term health and environmental programs in the poor countries of the world; and
2. Promote in Congress the passage of legislation that will provide tax and other incentives so that American banks, the International Monetary Fund and the World Bank will remit national debts in developing countries on the condition that additional funds in local currency, equivalent to the payments required under current obligations, will be allocated to continuing programs for the following activities:
   - Expansion of child survival and nutrition programs.
   - Development of a primary healthcare infrastructure.
   - Initiation and expansion of control efforts against major endemic diseases such as malaria, leprosy, tuberculosis, childhood pneumonia and other infectious diseases.
   - Improvement of environmental conditions to enhance the quality of life and protect local ecology in developing countries where massive environmental deterioration is having both local and worldwide impact.

House Action: This resolution was not adopted, but was referred to the AMA Board of Trustees for action.

Executive Director

Mr. President and Members of the House of Delegates:

The 1989-1990 year was successful for the physicians of Maryland. All of the Faculty's achievements are the result of the work of many dedicated physician members.

Faculty Position Papers Among Med Chi's most noteworthy successes in 1989-1990 was the initiation of the Faculty's position papers by President Raymond M. Atkins MD. Council passed six position papers on the following subjects: AIDS, prescription drug control, cholesterol testing, the problems of the uninsured, peer review management, and teen pregnancy and infant mortality. These papers helped Med Chi take a

proactive stance on many legislative issues and proved to be a useful tool in this year's lobbying efforts.

1990 Legislative Session Another significant Med Chi achievement was the legislative rally. Almost 200 physicians showed their strong support of organized medicine by attending this year's rally in Annapolis. The large physician turnout was a clear demonstration of unity among physicians and it helped to show our state legislators that physicians do not want further government regulation of medicine. Among the legislators speaking at the rally were Speaker of the House, R. Clayton Mitchell, and Senate President, Thomas V. Mike Miller.

Because of the strong support from member physicians this legislative session, Med Chi experienced a number of legislative victories. These included the defeat of Mandated Medicare Assignment for the fourth consecutive year. The Faculty opposed this bill that would have required physicians to accept Medicare assignment based on income levels. A bill that would have required a Triplicate Prescription Program to be initiated in Maryland also was opposed by the Faculty and defeated. The General Assembly also defeated a bill that would have prohibited physicians from referring patients to laboratories in which the physician had a financial interest.

Other significant legislative victories include the defeat of House Bill 1248, a Health Services Cost Review Commission (HSCRC) submission that would have regulated the activities of anesthesiologists, radiologists and pathologists; and, the defeat of House Bill 1195, another HSCRC bill, which would have initiated studies on the utilization and cost of non-hospital healthcare services and recommended utilization control mechanisms for these services.

Med Chi also strived to pass several bills that will benefit medicine in Maryland. Among this legislation was a bill that will provide additional counseling for the Physician Rehabilitation Program.

(For a more in-depth discussion of legislative activities this year, see the Legislative Committee report on p.757).

Expenditure Targets Defeated On the national level, Med Chi physicians helped defeat the Expenditure Targets (ETs) proposal in Congress. The AMA lobbied hard to prevent this proposal which would have limited the amount paid for physician services under Medicare. Following the defeat of ETs, Congress created the Medicare Volume Performance Standard (MVPS), a mechanism to provide detailed data to Congress on service volume and intensity changes, rather than ascribing expenditure increases solely to physicians. Under MVPS, the Secretary of Health and Human Services must analyze the factors behind the growth in expenses, such as patient demand, new technology, and the aging and growth of the Medicare population. Med Chi and the AMA are optimistic that MVPS will provide a more rational and equitable analysis of the current system.

Professional Liability In addition to its legislative victories, Med Chi worked hard to strengthen Maryland medicine in other areas. One of Med Chi's primary goals last year was aimed at lowering liability insurance premiums. Throughout the past year, Med Chi worked closely with the Medical Mutual Liability Insurance Society of Maryland to secure further reductions in liability insurance rates. As a result, Medical Mutual did not seek a rate increase for its member physicians in 1989. This was the third consecutive year that Medical Mutual did not increase its rates. In January 1990, Medical Mutual announced that it would offer a 5 percent premium discount to all its members who attend a risk management seminar designed to teach physicians how to improve their communication skills. Both Med Chi and Medical Mutual maintain that improved communication skills will enhance quality of care and can reduce the risk of malpractice claims.

Increased Fee Schedule for Medicaid While attempting to reduce malpractice premiums, Med Chi also endeavored to increase Medicaid reimbursement. At its meeting in March 1990, Council voted to support a new Medicaid program. The Council's position was to support an across the board increased fee schedule. The increase is intended to encourage a greater number of primary care providers to care for Medicaid patients.

New Credentialing Service Med Chi also entered into a new joint venture with the Maryland Hospital Association to create Healthcare Credentials Verification, Inc., an organization that will collect and disseminate the information hospitals need to credential and recredential physicians for medical staff appointment and reappointment. This organization, which holds the same immunity as a medical review committee under current law, is designed to simplify the credentialing and recredentialing process for all physicians.

New Peer Review Manual Another significant accomplishment was the creation of a new peer review manual. This manual, prepared through the cooperation of Med Chi's Peer Review Committee, Component Societies, and the Board of Physician Quality Assurance (BPQA), has become a national model for use in other states. In April, this manual was presented at the annual meeting of the Federation of State Medical Boards of the United States and was commended for its effectiveness.

AMA Leadership Conference Maryland physicians received national recognition for a second time in 1989 during the AMA National Leadership Conference in Phoenix, Arizona. Wayne C. Spiggle MD from the Allegany Health Right Program was featured in a seminar entitled "Bridging the Gap," which presented model programs demonstrating ways the medical profession can regain the public's trust. The Allegany

County Medical Society's Allegany Health Right program for gray-area patients who do not qualify for government aid and cannot afford health insurance, is an ideal example of a program that epitomizes the attitude inherent in physicians: to strengthen the doctor/patient relationship.

Health Access America In March, Med Chi announced its support of the AMA's Health Access America, a nationwide program with ideals similar to those of the Allegany Health Right Program. Health Access America is a proposal to improve access to affordable, quality healthcare for all Americans. The proposal, which accentuates the strengths of our medical care system, attempts to correct the problem of over 33 million Americans who lack health insurance coverage and cannot afford the cost of medical treatment. The proposal contains 16 points designed to correct our medical system's weaknesses by controlling healthcare cost increases, reforming Medicare and Medicaid, and insuring all Americans access to affordable healthcare. The proposal also will initiate further tort reform, establish state level risk pools for individuals who cannot afford insurance, and formulate practice parameters for physicians.

President's Regional Conferences Another of Med Chi's primary goals for 1989-1990 was to increase communication among Med Chi, component societies and member physicians. President Raymond M. Atkins MD continued the tradition initiated by Past-President Michael R. Dobridge MD by holding regional conferences in the western, southern and eastern corners of the State. Med Chi hopes to continue regional meetings to keep physicians informed about Med Chi policies and plans, upcoming legislation, and general news; and it is hoped that these meetings will encourage participation in Med Chi activities by all members.

Med Chi Semiannual Meeting In addition to regional meetings, Med Chi sponsored its Semiannual Meeting at the Sheraton Resort and Conference Center in Ocean City from September 14-16, 1989. The meeting featured a number of scientific sessions and was highlighted by the presentation of several Faculty Position Papers.

Med Chi Annual Meeting "What Can We Expect in the 1990s" was the theme for Med Chi's Annual Meeting held from May 9-11, 1990 at the Turf Valley Hotel and Country Club in Ellicott City. During the meeting, American Medical Association (AMA) Trustee, Lonnie Bristow MD, delivered an address on "Healthcare Financing: An American Solution." Other speakers included Congressman Benjamin L. Cardin on "Federal Legislative Issues in the 1990s," and Johns Hopkins Medical School Professor of Genetics, Victor A. McKusick MD, who spoke on the latest scientific developments in genetics. In addition, representatives from the AMA reviewed our nation's legislative affairs, and long-range plans and expectations.

It has been an honor and a privilege to serve the members of Med Chi this year. I send my deepest appreciation to all the physicians who actively participated as Med Chi members; your contributions helped make this year a productive one for medicine.

Angelo J. Troisi FACHE, Executive Director

Treasurer

Mr. President and Members of the House of Delegates:

The financial books and records of the Medical and Chirurgical Faculty for the year ended December 31, 1989 have been audited by the firm Naden Lean, Certified Public Accountants.

The financial statements reflecting the financial position of the Faculty at year end 1989 and 1988, and the related statements of income, expenditures, transfers, and changes in fund balances for the years then ended are published in the report. The auditors have submitted an unqualified opinion that the financial statements are accurate and conform to generally accepted accounting principles.

The 1990 Budget was approved by Council in January and is presented in this report for your information. It is the first time a zero-based budget was developed.

The investment portfolio was reviewed and is part of the report of the Finance Committee Report.

Jose M. Yosuico MD, Treasurer

Med Chi members attend a lecture in the Grand Ballroom at Turf Valley Hotel and Country Club at this year's Annual Meeting.

CERTIFIED PUBLIC ACCOUNTANTS

The Medical and Chirurgical Faculty
of the State of Maryland
Baltimore, Maryland

The audited financial statements of the Faculty as of December 31, 1989 and 1988 and our report thereon are presented in the preceding section of this report. The financial information presented hereinafter was derived from the accounting records tested by us as part of the auditing procedures followed in our examinations of the aforementioned financial statements and , in our opinion, it is fairly presented in all material respects in relation to the financial statements taken as a whole; however, it is not necessary for a fair presentation of the financial position and results of operations of the Faculty.

The Medical and Chirurgical Faculty of Maryland
Baltimore, Maryland

Notes to Financial Statements
December 31, 1989

Note 1 - Summary of Significant Accounting Policies

The Medical and Chirurgical Faculty of the State of Maryland is a nonprofit organization, tax exempt under Section 501 of the Internal Revenue Code.

Marketable securities are carried at cost. Market values at December 31, 1989 and 1988 were $2,771,443 and $2,376,946, respectively.

The Faculty carries its investment in the 100 percent-owned Med Chi Agency, Inc., at equity. The net assets of the corporation as of December 31, 1989 and 1988 were as follows:

	1989	1988
Current assets	$744,726	$284,076
Fixed assets - net	24,186	17,682
	768,912	301,758
Current liabilities	695,122	198,899
	$ 73,790	$102,859

Fixed assets of the plant fund, other than personal property, are recorded at cost. Portraits were appraised as of December 31, 1963 at $65,000, an increase of $51,000 over prior years. All other personal property was appraised as of December 31, 1949. Depreciation on fixed assets is not provided. A schedule of fixed assets follows:

	1989	1988
REAL ESTATE		
1209-1215 Cathedral Street		
Land and buildings	$110,636	$110,636
Improvements	543,035	543,035
1205-1207 Cathedral Street and 1204 Maryland Avenue		
Land and buildings	2,138,624	2,134,752
Improvements	188,296	188,296
224 Main Street, Annapolis		
Land and buildings	545,856	6,260
	3,526,447	2,982,979
OTHER		
Library books, journals	231,370	231,370
Office and library - fixtures, antiques & museum pieces	87,570	87,570
Portraits	65,000	65,000
	383,940	383,940
	$3,910,387	$3,366,919

Fixed assets of the general fund are recorded at cost and depreciated using the straight-line method over their estimated useful lives for assets acquired prior to 1981, using the accelerated cost recovery system for assets acquired after 1980 and the modified accelerated cost recovery system for those acquired after 1986.

	Dec. 31, 1989	Dec. 31, 1988	Life in Years
Automobiles	$ 15,700	$ 32,000	3
Office equipment and furniture	308,384	290,282	5-10
Total cost	324,084	322,282	
Less - accumulated depreciation	268,432	235,324	
	$ 55,652	$ 86,958	

Provision for depreciation charged to operations for the years ended December 31, 1989 and 1988 was $48,992 and $48,585, respectively.

Deferred income reflects dues collected in November and December for subsequent years.

Note 2 - Pension Plan

The Faculty has a noncontributory pension plan covering substantially all its employees. Pension expense for the current year and prior year were $89,408 and $91,832 respectively, which includes amortization of prior service cost over 20 years. The Faculty's policy is to fund pension costs accrued. Actuarially determined pension costs are funded on an annual basis by the Frozen Initial Liability method with initial accrued liabilities computed under the Entry Age Normal Cost method. The accumulated plan benefits and plan net assets for 1989 have not been calculated. The last accumulated plan benefits and plan net assets for the Faculty is presented below:

	1988
Actuarial Present Value of Accumulated Plan Benefits	
Vested	$662,369
Nonvested	103,199
	$765,568
Net assets available for benefits	$897,015

The assumed rate of return used in determining the actuarial present value of accumulated plan benefits was 6.5 percent for 1988. The fund's assets as of April 1, 1988 exceeded the vested benefits by $234,646.

Note 3 - Related Parties

The Medical and Chirurgical Faculty of the State of Maryland owns the stock of the Med Chi Agency, Inc. The Faculty leases office space to the Agency under a month-to-month lease. Lease payments from the Agency were $17,286 per year for 1989 and 1988. Additionally, the Faculty performed certain management and accounting services for the Agency; income for these services was $105,000 per year in 1989 and 1988.

Physicians wanted for leading practice

Prestigious national group specializing in the treatment of venous disorders has exceptional opportunities in major metropolitan areas throughout the United States. We are in need of physicians trained in internal medicine, surgery or who have a broad based medical background to establish and direct a clinic as well as practice our state-of-the-art treatment techniques. We will provide complete training in the latest proprietary techniques of treating venous disorders. We offer an outstanding compensation package in the six figure area along with malpractice insurance and health benefits. Additionally, we offer a 40 hour work week, no weekend hours and freedom from beepers. You also won't have to worry about soliciting for patients or fighting insurance companies.

This is an outstanding opportunity for professional and financial advancement. If you are motivated to build a rewarding practice with the leader in the treatment of venous disorders, send your curriculum vitae to:

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Managing Diabetes While Traveling

Doctor, My new job will require more travel with an occasional trip to Europe. Would you give me some guidelines to follow in the management of my diabetes when away from home?

The management of diabetes when vacationing and traveling may be a little difficult, but if one plans ahead and anticipates problems before they occur, the necessary adjustments should be easily accomplished. Some guidelines are:

- Travel in daytime hours as much as possible.
- If passing through "Customs," carry a physician's note stating that you have diabetes and need the syringes and other supplies that you have with you.
- Carry with you at all times the insulin, syringes, blood glucose monitoring equipment, etc. needed for the entire trip in an attaché case or handbag, *and never check as baggage*. Special containers and refrigeration of insulin are not needed unless the travel is for several months. Of course, if refrigeration is readily available it should be utilized.
- Carry small packages of raisins or other carbohydrates in case of need for hypoglycemia.
- Airlines will provide special meals as needed if notified 48 hours in advance of your departure.
- If traveling in the same time zone or the variation is not over two hours per 24 hours, the customary insulin schedule can usually be maintained.
- Duplicate prescriptions for all medications and eyeglasses should be kept on hand, as well as a summary of pertinent medical history.
- An up-to-date diabetes identification card should be carried in your wallet at all times, in addition to an identifying bracelet or necklace.
- If traveling or vacationing with a companion, that person should have a knowledge of the use of glucagon, and one or more units should be with your medical supplies.
- If your diabetes is controlled by an "oral agent" or diet alone, adjustments are usually unnecessary.
- If travel involves over 4-6 time zones in one day, an individualized plan should be constructed based on the time of departure, number of stops or transfers, and arrival time. For lesser travel, the information provided by the Table may be used as a suitable plan.

Table.

Travel Plan	Change In Insulin Dose	Notes
North or South	None	
East or West (1-2 hour difference)	None	Test blood glucose regularly*
East (3-6 hour difference)	For shorter day, decrease insulin by 10-25% (NPH or Lente)	Test blood glucose regularly*
West (3-6 hour difference)	For longer day, increase total insulin by 10-25%. (Primarily regular insulin)	Eat an extra meal on arrival

* Blood glucose testing should be done before each meal, or more frequently if test result is above 150 mg/dl. Supplemental regular insulin, if needed, is difficult to recommend by rote but a rule of thumb would be 2-4 units/50 mg/dl of blood glucose above 150, depending upon the activity of the individual at the time.

Microsurgery Training at The Johns Hopkins Hospital, one week, offered continuously throughout the year. 40 AMA Cat I credits. Info: P. Williams 301-955-3169.

President's Inaugural Address

On May 11, 1990, during Med Chi's Annual Meeting, Med Chi President, Reynaldo L. Lee-Llacer MD, delivered the following Inaugural Address to the Members of the House of Delegates:

During the past few years, while serving as Chairman of the Council and President-Elect, I have had the privilege of visiting almost all county medical societies within our State. I have heard many philosophies from my colleagues about the future of medicine, some very positive and others somewhat less than positive.

These mixed feelings held by many of you here today, gave me much to consider as I prepared to assume the office of President of the Faculty, an office cloaked in the accomplishments of so many learned, loyal and committed leaders of medicine.

Only a few years ago, the winds of despair were blowing--despair for physicians caused by increases in malpractice insurance premiums of 20, 30 and even 40 percent. These winds of despair caused many of my friends and yours, obstetricians and others, to abandon that practice of medicine which they loved so very much. These same winds of despair affected others around the world; those in Eastern Europe, Central America, the Middle East, China, and South Africa to name a few.

During the past year, the winds of change have brought walls tumbling down, great taboos have been shattered, the unthinkable is becoming very real.

Would any of us have thought a year ago that there would be a united Germany, that small countries like Lithuania and Latvia would have voted for their independence? That Nelson Mandela, a man thought to be imprisoned for life, would have been given his freedom? That the Berlin Wall would have been torn down?

The winds of change have caused these events to take place and it all started with a single idea in the mind of one person, then two and then 200 and more; then the people acted on this idea causing these remarkable events to occur. And the unthinkable a few short years ago is now real. These changes are occurring because someone was willing to take a risk, to tear down the wall, to shatter the taboos, to dedicate himself to medicine.

For the past few years we have experienced reductions in our malpractice premiums, and we should expect to experience a great many more changes brought to us by the winds of hope.

I hope as we leave this meeting, we will be convinced that life as a physician is not as bad as it has been portrayed and that necessary change can and will occur. This is not to say that we don't have problems, because we do; but most of our problems can be attributed right back to us - you and me. How did you treat the last patient you saw yesterday? Would you be comfortable if that last patient was a member of the jury tomorrow, judging you in a malpractice suit? Would that last patient be willing to call his or her state senator or delegate and ask that the legislature vote "yes" for a particular bill that would reduce barriers to good sound doctor-patient relationships?

Reynaldo Lee-Llacer MD awaits his inauguration on Friday, May 11, 1990.

We in this room are the profession of medicine in Maryland, along with your colleagues who are right now in emergency rooms, surgical suites, clinics and offices caring for people as we speak, caring for 150,000 patients per day in Maryland.

We doctors must create our own winds of hope and maybe we can count on those 150,000 patients we care for each day to be a part of those winds of change.

As we look forward to the challenges of the new decade, let us remember that we not only live in a time where anything is possible but that the possibilities range beyond what we can imagine, that our problems today will make us stronger tomorrow and that whatever our problems, whatever our uncertainties, medicine is still the most exciting and rewarding profession there is. With your help, I shall do my very best to find solutions to our mutual challenges.

Thank you. ■

Wayne C. Spiggle MD (c) and Mrs. Helen Spiggle (l) accept the A. H. Robins Award from President Raymond M. Atkins MD (r).

1990 A.H. Robins Award

On May 9, 1990, Wayne C. Spiggle MD of Cumberland, MD received the 1990 A.H. Robins Award for Community Service. In a recent letter sent to Med Chi's Past President Raymond M. Atkins MD, Dr. Spiggle wrote the following comments regarding his award:

> Thank you for the 1990 A.H. Robins Award for Community Service in Maryland. It represents a high honor and is symbolic of what many physicians throughout Maryland are doing in their community.
>
> I feel that this award really belongs to the Allegany County Medical Society. Many of the activities which prompted this award have been accomplished through the active support and involvement of our local medical community. I thank them for a willing involvement in the affairs of our community, not only through Allegany Health Right, a recently established program to care for the gray area patients, but also for the ACCESS program, a program designed to accommodate Medicaid patients and for our involvement in disaster relief, community health education and many other activities. The Allegany County Medical Society truly considers the community as its patient.
>
> I know other Medical Societies are doing this as well, but my personal recognition at the last Med Chi meeting is incomplete without acknowledging the collegiality which has become our hallmark.
>
> The Allegany Health Right Program is attracting a lot of excitement, so I want to give special thanks to Governor William Donald Schaefer, who worked closely with Delegate Cas Taylor, the county delegation and county commissioners to provide initial funding to make the Allegany Health Right a reality. Governor Schaefer's "do it now" attitude and his willingness to work with us to better serve the public should be applauded by all Maryland physicians.
>
> Yours Truly,
> Wayne C. Spiggle MD ■

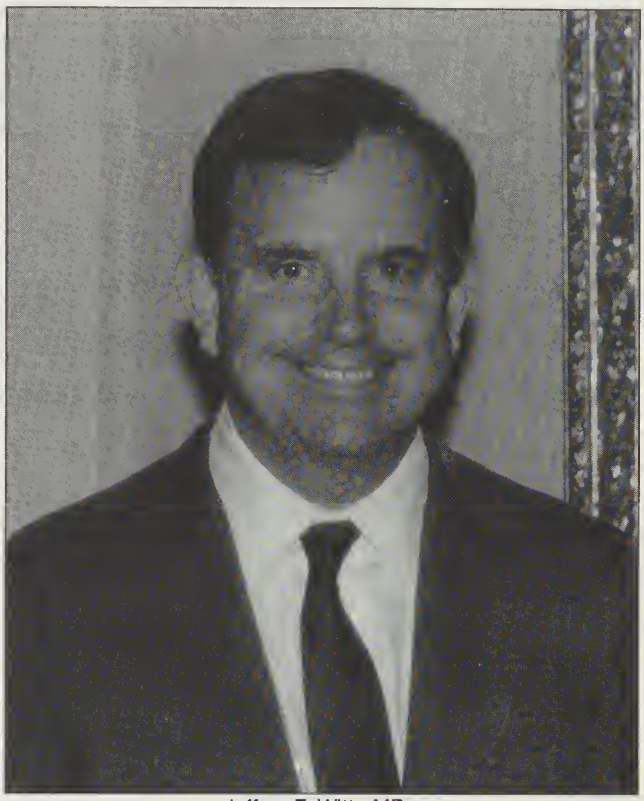
Physician Placement Services

The Medical and Chirurgical Faculty of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201-5585
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.



Jeffrey F. Witte MD assumed the Presidency of the Montgomery County Medical Society (MCMS) on May 11, 1990.

Dr. Witte, an orthopaedic surgeon from Rockville, MD, graduated from Georgetown University and the University of Michigan Medical School. Since completing an orthopaedic residency at George Washington University Medical Center, he has been in private practice in the Rockville-Gaithersburg area with Shady Grove Orthopaedic Associates. He served as an orthopaedic surgeon in Viet Nam at both the 8th Field and 17th Field Hospitals for which he received multiple awards, including the Bronze Star.

No newcomer to medical leadership, Dr. Witte undertakes the highest office in the MCMS after holding a number of offices in the Society and at Shady Grove Adventist Hospital where he is immediate Past-Chairman of the Department of Surgery. He is Past-President of the Washington Orthopaedic Society and a member of the faculty at George Washington University Medical Center. He is board certified in orthopaedic surgery and a member of the American Academy of Orthopaedic Surgeons.

During his Presidency, Dr. Witte intends "to participate in decisions regarding medical care for the uninsured and underinsured, and to assure that *quality* is maintained in the care that is given."

Other MCMS officers are *Herman Maganzini MD*, President-Elect; *Cheryl Winchell MD*, Immediate Past President; *Fred A. Gill MD*, Secretary; *William W. Mullins MD*, Treasurer.

Jeffrey F. Witte MD

■ ■ ■

On May 19, *Lee E. Gresser MD* was installed as President of the Maryland Academy of Family Physicians (MAFP) during the organization's 42nd Annual Meeting and Scientific Session at the Sheraton Ocean City Resort and Conference Center. A graduate of the University of Maryland Medical School, Dr. Gresser is a Diplomate (board certified) of the American Board of Family Practice and a Charter Fellow of the American Academy of Family Physicians.

Other MAFP officers inducted were *Joshua R. Mitchell, III MD* as President-Elect; *Joseph P. Connelly, Jr. MD* as Secretary; and *John B. Littleton MD* and *Abdul Nayeem MD* as Vice-Presidents.

■ ■ ■

John E. Hoopes MD, who directed expansion of the Division of Plastic Surgery at The Johns Hopkins Medical Institutions over the last 20 years, retired on June 30, 1990.

A 1957 graduate of the Hopkins School of Medicine, Hoopes became Professor and Chairman of the Plastic Surgery Division at Hopkins in 1970 after being head of that specialty at the Washington University School of Medicine for two years.

Under Hoopes' direction, the plastic surgery training program at Johns Hopkins was increased from two residents for two years to three residents for three years. Also, a 25-member, part-time faculty was recruited to augment the training program.

Hoopes also forged a pioneering plastic surgery residency training program involving the Hopkins School of Medicine, the University of Maryland School of Medicine and Baltimore's Veterans Administration Hospital.

Hoopes is currently president of the American Association of Plastic Surgeons. In addition to affiliation with numerous plastic surgery and specialty-publishing organizations and their boards, he has served as Chairman of the Advisory Council for Plastic and Maxillofacial Surgery of the American College of Surgeons since 1987.

Hoopes is co-editor of the *Journal of Plastic and Reconstructive Surgery*. He has published 160 scientific papers, more than 50 book chapters and has been co-editor of three books. He is a resident of Gibson Island, MD. ■

Join the Cardiac Counterattack

An Early Cardiac Care Program can reduce heart attack deaths and disabilities. Your community hospital can save lives by starting an Early Cardiac Care Program.

This is a proven and successful model program, and we can tell you all about it for free. A complete kit, that includes two videotapes and informative booklets, explains how to set up an effective Early Cardiac Care Program.

Our goal is to topple heart attack from its position as the number one killer of adults in the United States. Join us in forming an effective community network to counterattack death and disability from heart attacks.

Don't delay! For more information about the Early Cardiac Care Program, call 1-800-926-5454 (in Maryland, 301-792-1060), or contact: Raymond D. Bahr, M.D., at 301-368-3217.

DHMH DRG HMO

Most people are when it comes to medicine today. Increased communication is the only way physicians can help improve the public's understanding of medicine. In an effort to promote communication, Med Chi is seeking physicians to participate in a Speaker's Bureau.

As a Bureau Speaker, you help strengthen physician's public image by projecting an accurate representation of the goals and values of all Maryland medical professionals.

To become a member of Med Chi Speakers Bureau simply complete the address information, check the appropriate topic(s) listed below, and mail this form to Betsy Newman, Public Relations, Med Chi, 1211 Cathedral Street, Baltimore, MD 21201.

The most common form of child abuse.

...is letting them ride unprotected in the car.

The National Safety Council says 81 percent of America's children ride totally unprotected.

Each year, nearly 700 children under the age of five are killed in auto accidents.

The cure is in your hands. Buckle it.

BUCKLE UP
It's a lifesaver.

Presented as a public service by
The Maryland Committee For Safety Belt
and AEtna Life & Casualty

You don't have to move mountains to make a difference on this earth. Or be a Michelangelo to leave your mark on it.

Leaving even the smallest legacy to the American Cancer Society can help change the future for generations to come. By including the American Cancer Society in your will, you'll be leaving a loving and lasting impression on life.

You see, cancer is beatable. The survival rate for all cancers is already approaching 50% in the United States.

You'll be giving a gift of life to the future. And giving life is the greatest way of leaving your mark on it.

AMERICAN CANCER SOCIETY®

For more information, call your local ACS Unit or write to the American Cancer Society, 4 West 35th Street, New York, NY 10001.

The Personality Disorder Treatment Program of Sheppard Pratt Hospital

Very often, specialized inpatient evaluation and treatment is a critical step in the effective care of a borderline patient.

The Personality Disorder Treatment Program at Sheppard Pratt offers a combination of services that may help to untangle difficult clinical questions and facilitate your patient's continued outpatient treatment.

We offer:

- ☐ Short-term and intermediate-term specialized inpatient treatment
- ☐ Extended-term intensive inpatient treatment
- ☐ Comprehensive diagnostic evaluation
- ☐ Psychotherapy and psychopharmacology consultation
- ☐ Intensive individual and group psychotherapy provided by our staff of psychiatrists and psychologists
- ☐ Long-term treatment planning

If you would like to know more about the Sheppard Pratt approach to the borderline patient and other patients with severe personality disorders, contact the Adult Admissions Office at:

(301) 938-3800
6501 North Charles Street
Baltimore, Maryland 21285-5815

Why buy an office automation system that doesn't offer a long-term solution?

ACCLAIM™ from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

IBM® and compatible hardware.

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

Long-term support.

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people are always there to make sure your system fits your needs over the years to come.

Easy to operate.

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.

Venomous Snakes in Maryland: The Copperhead

©1990 Medical Mutual Liability Insurance Society of Maryland. All rights reserved.

Endorsed by Med-Chi for Maryland Physicians

Maryland Physicians: Thanks To You, It Works.

The history of Medical Mutual is really the story of physicians working together to surmount complex problems which had defeated others. Through cooperation, persistence and the strength to make difficult decisions, the physicians of Maryland have set an example for the rest of the country.

It all began, of course, in 1975 when the major medical malpractice insurers announced they were leaving Maryland. Spiraling malpractice awards and the prospect of large-scale losses, the companies said, made it impossible to do business in Maryland. As the potential threat to public health became evident, many people feared that health care delivery in the State was on the verge of collapse.

With no relief in sight, physicians, citizens, and the General Assembly worked together to create what had never before existed anywhere — a medical professional liability insurance company owned and directed by its physician members. On June 3, 1975, Medical Mutual was created.

Over the past 15 years, other companies have come, and gone, and come again — entering Maryland when there were profits to be carried away, and leaving whenever times got tough. Through it all, Medical Mutual's physicians have proved that their long-term commitment was the right choice.

For 15 years, our thousands of physician members have been at the heart of what we are, and we are unique because of your needs, your insight, and your guidance.

The success we have earned was by no means universally predicted in 1975. But we survived those difficult first years, and now, 15 years later, we are proof of what physicians can do when they work together for a common goal.

Thanks to you, it works.

SEPTEMBER 1990 VOLUME 39 NO 9

ARTICLES

Nearing the end of another long Maryland summer when many people spend as much time as possible enjoying favorite outdoor activities, we present three articles dealing with situations typically encountered during this season.

Drs. Barry S. Gold and Robert A. Barish discuss current concepts in diagnosis, treatment, and management of bites from venomous snakes indigenous to Maryland.

Dr. Mary Wagner warns that drowning is the second leading cause of accidental death in children under 14 years old. By definition, "drowning" results in death; Dr. Wagner focuses on the treatment and prognosis of near-drowning victims as well as prevention.

Finally, we present excerpts from a 1989 NIH Consensus Statement on sunlight, ultraviolet radiation, and the skin.

Venomous Snakebites 833
Barry S. Gold MD and Robert A. Barish MD
As the incidence of snakebites increases, physicians need to be able to recognize venomous bites and to be familiar with current concepts in diagnosis, treatment, and management of snake envenomation.

Near-drowning Accidents Among Children 847
Mary H. Wagner MD
Water-related activities are a source of family fun and exercise, but everyone needs to be aware of the potential hazard of drowning and near-drowning.

Sunlight, Ultraviolet Radiation, and the Skin
Excerpts: NIH Consensus Statement 851
Sunlight, the ultimate source of energy, is vitally important to life, but there is overwhelming evidence that exposure to natural or artificial ultraviolet radiation (UVR) has the potential for causing acute and chronic adverse effects on the skin.

Case Report: Thoracic Spine Schwannoma: The Role of Gd-DTPA Enhanced MRI 853
James S. Lim MD, Henry Wang MD, John Griffin MD, and Donlin M. Long MD, PhD
With the advent of MRI, spinal lesions can now be evaluated noninvasively. Knowing the location of the spinal lesion, its morphology and signal characteristics can narrow the differential diagnosis.

Centralized Credentialing: State-of-the-Art Confidential Clearinghouse 857
Joseph E. Jensen
In Maryland, a single organization serves as a clearinghouse for gathering and making available to hospitals those documents needed to verify a physician's credentials.

Information for Authors

Manuscripts may be sent to Editor, *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect. Multimate, or Wordstar program.

Include full name of author(s) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double spaced and numbered consecutively as they appear in text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the *Uniform Requirements for Manuscripts Submitted to Biomedical Journals* compiled by the International Committee on Medical Journal Editors (available through the *Annals of Internal Medicine*).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the author and *MMJ*.

One Insurance Agency Can Handle All Of Your Policies

Contemporary Insurance Services:

* Is prepared to advise you concerning all malpractice insurers
* Carries very low cost term insurance and high-grade universal and whole life products
* Carries excellent disability, overhead and buy-sell products with liberal policy definitions and competitive rates
* Carries excellent health insurance products
* Carries excellent office liability products

Contemporary Insurance Services is one of the largest brokers of malpractice insurance to Maryland physicians. Many of our clients rely on us for all of their insurance needs. Let us show you why many of our clients prefer to handle all of their insurance needs through one agent.

In today's market, you need an insurance broker you can rely on. For more information, complete and return:

$1,000,000 Celebration

We are pleased to announce that **MED PAY** has funded $1 million in annualized physicians billing this year.

This means no more insurance or collecting hassles for our new clients including:

- Psychiatrist
- Orthopedic Surgeon
- Physical Therapist
- Podiatrist
- Internist

We would be glad to schedule a free consultation to discuss how this timely billing and cash flow (Get paid today for patients seen yesterday and convert your present receivables to cash) program can be of benefit.

Receive Payment Today for Patients Seen Yesterday

Selected Communicable Diseases in Maryland in 1989 (Continued)

MUMPS (625)

13.4/100,000 (U.S. 2.6/100,000)

The number of reported cases of mumps in 1989 was at a ten year high (Figure 13). Six outbreaks in schools and colleges explain most of the 3-fold increase from 1988. The highest rate in the State (50.1/100,000) was in St. Mary's County where 3 outbreaks occurred. Other counties with high number of cases and high incidence rates (of approximately 35/100,000) were Carroll County (43 cases) and Prince George's County (251 cases). In Anne Arundel County a single large outbreak in April and May contributed to the rate of 34.1/100,000.

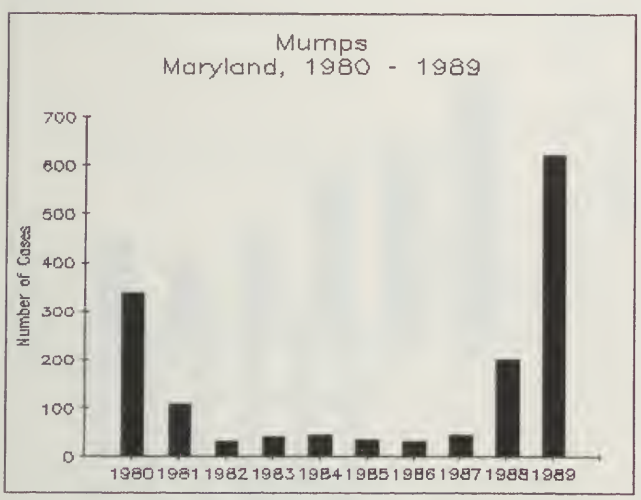

Figure 13

Overall, the month-by-month trend in 1989 showed 2 peaks - one in the late spring and one in late autumn . The highest incidence rate was observed among individuals 15 to 19 and 10 to 14 years of age (Figure 14). These 2 groups comprised 73.4% of all cases. Only 11.5% were 5 to 9 years of age. No cases were reported in persons over 50 years of age. The male to female ratio was 1.5 to 1.0. Thirty-four percent were white, 33.0% were black and in 28.6% race was not reported. Only 5.5% of cases were laboratory confirmed.

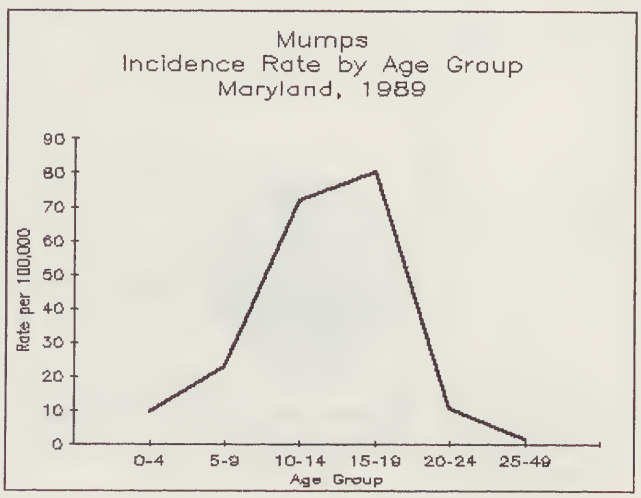

Figure 14

PERTUSSIS (96)

2.1/100,000 (U.S. 1.5/100,000)

The incidence of pertussis almost doubled in 1989 as compared to 1988. The cases were sporadic or confined to family members. No outbreaks were reported. The number of cases by county is shown in Table 1 (see July, 1990 issue). Pertussis was reported in patients ranging in age between 1 month and 48 years; 73 (76.0%) were less than 9 years and 34 (35.4%) were less than 1. The age specific incidence rates are shown in Figure 15. The male to female ratio was 0.7:1.0.

Fifty-six patients (58.3%) became ill in the summer with peak incidence in August.

Forty-four (45.8%) cases were laboratory confirmed: 10 (10.4%) by DFA only, 18 (19.0%) by culture only, and 16 (17.0%) by both culture and DFA.

Cough occurred in all cases. The following symptoms were also reported: paroxysmal cough in 88 (92.0%), upper respiratory symptoms in 79 (82.3%), post-tussive vomiting in 62 (65.0%), cyanosis in 32 (33.3%), and apnea in 29 (30.2%) of the patients. Pneumonia was the most frequent complication and was reported in 14 (15.0%) of the patients. Two (2.1%) had seizures, and one (1.0%) encephalopathy. Thirty-six (37.5%) patients were hospitalized for an average of 5 days. Fifty patients (52.1%) had had less than 3 doses of DTP vaccine.

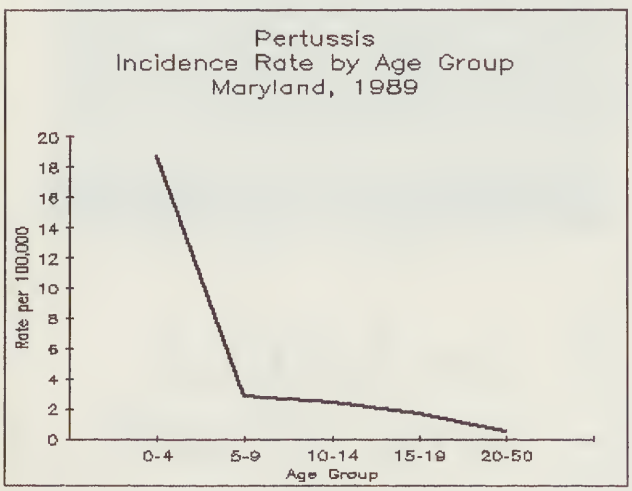

Figure 15

Of 55 cases age 6 months through 18 years of age, only 20 (36.3%) were appropriately vaccinated for their age, according to current pertussis vaccine recommendations.

ANIMAL RABIES (389)

The trend of decline since 1984 of animal rabies was disrupted in 1989 by a 15.1% increase of laboratory confirmed rabid animals (Figure 16). The cases by jurisdiction are presented in Table 1 (see July, 1990 issue). The Mid-Atlantic raccoon rabies epizootic, that started in 1977 in West Virginia and spread to Allegany County in 1981, has been advancing at approximately 25 miles per year. In 1989 rabies was reported in Kent County despite the efforts of the Delmarva Rabies Initiative to create an "immune barrier" in Cecil County and New Castle County, Delaware. (The project was designed to halt the spread of rabies to the Eastern Shore by vaccinating raccoons in a 5 mile area south of the Chesapeake and Delaware Canal).

The epizootic cycle has been maintained by raccoons which accounted for 75.8% of the rabid animals in 1989 (Table 2). Rabies in bats which has been epidemic in Maryland for many years is epidemiologically and antigenically distinct from rabies in tetrapods (four-footed animals).

Table 2 Animal Rabies
Maryland, 1989

SPECIES	No.	%
BAT	26	6.7
CAT	16	4.1
DOG	2	0.5
FOX	23	5.9
RAC	295	75.8
SKU	19	4.9
OTH	8*	2.1
TOTAL	389	100.0

* 3 equine, 4 groundhog, 1 sheep

The last two human cases of rabies in Maryland were reported in 1976 and 1945.

Hundreds of people have received post-exposure rabies prophylaxis following known or potential rabies exposure, this preventing the development of human rabies.

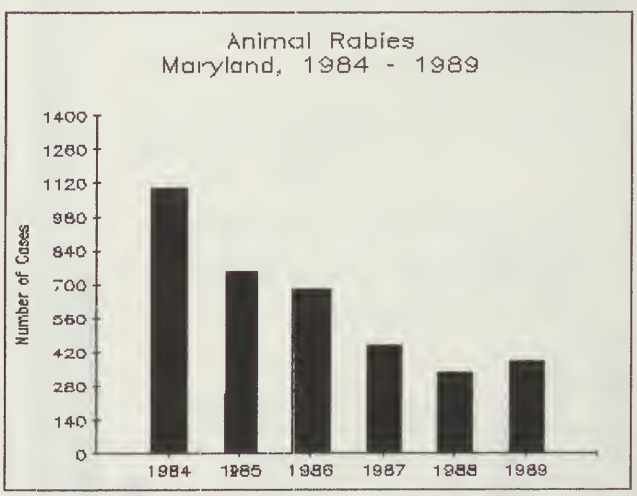

Figure 16

ROCKY MOUNTAIN SPOTTED FEVER(19)

0.4/100,000 (U.S. 0.3/100,000)

The incidence of RMSF continued to decline for the second consecutive year (Table 1; see July, 1990 issue). In 1989, 63% of the cases were residents of Talbot (with highest number of cases and highest rate per 100,000), Anne Arundel and Dorchester counties. Onset of illness was reported from April to September; eight cases (42.1%) occurred in June.

The male to female ratio was 1.7 to 1.0; the white to black ratio was 3.5:1.0 (the race of one case was not known). The patients' age ranged from 6 to 73 years (median 35 years).

Almost 90% had fever and headache, 9 had rash (7 of which had rash on the soles and/or palms). Hospitalization was required for 12 (63.2%) of the patients. All but one, for whom information was not available, were treated with tetracycline or chloramphemicol. None died.

Fourteen (73.7%) of the cases were confirmed with IFA tests (4-fold rise of titers or with single 1:64 titer), 2 were probable cases (one had a single IFA 1:128 titer, and the other - Proteus 0X2 1:320), and 3 were not confirmed (convalescent blood was not tested).

Within 14 days of the onset of the illness, eleven patients (58.0%) had tick bite(s), 6 had visited tick infested areas, and 2 individuals reported no known exposure to ticks.

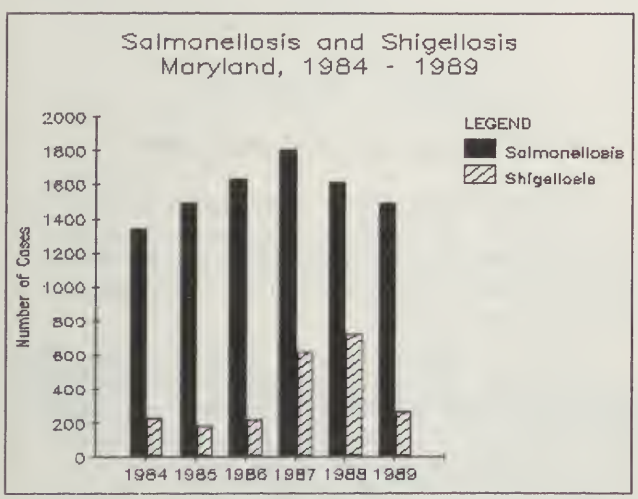

Figure 17

SALMONELLOSIS (1495)

32.0/100,000 (U.S. Not Available)

The decrease of salmonellosis noted in 1988 continued in 1989. Figure 17 shows the reported cases over the past 6 years. The number of cases by county is presented in Table 1 (see July, 1990 issue). Morbidity was at its highest (43.0% of all cases) in June through August; an additional 24.1% occurred in September through November. Children, less than 5 years of age accounted for 28.4% of the cases; of these, more than half were less than 1 year of age. Individuals between 20 and 39 years of age comprised 26.3% of the cases. The male to female ratio was 1.0:1.0. The white to black ratio, for the cases with known race (1276) was 1.9:1.0.

Fifteen outbreaks were reported; 9 were foodborne, and the rest, undetermined. Serotypes of reported isolates are depicted in Figure 18 .

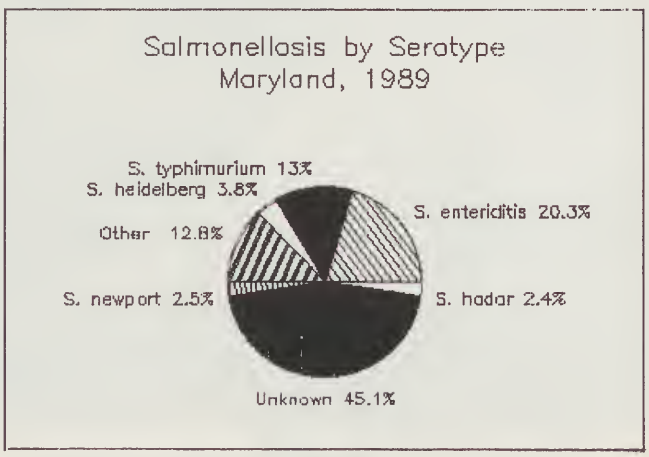

Figure 18

SHIGELLOSIS (276)

5.9/100,000 (U.S. Not Available)

After 2 years of high incidence, shigellosis decreased by 62.5% from 1988 (Figure 17). The highest rates per 100,000 population were noted in Washington (17.9), and Howard (14.2) counties; the highest number of cases (70) was reported in Baltimore City, followed by Montgomery County (43). The cases by county are presented in Table 1 (see July, 1990 issue). The male to female ratio was 0.8 to 1.0. More than a quarter (26.4%) of the patients were less than 5 years of age; an additional 20.0% were 20 to 29 years old.

The most prevalent serogroup was S. sonnei (72.8%), followed by S. flexneri (11.2%), S. boydii (1.4%) and S. dysenteriae (1.1%); the serogroup of 13.5% of the isolates was not available. Two outbreaks of shigellosis sonnei were reported in

January and February. The latter one occurred in a day care centerwith person to person spread.

SYPHILIS, PRIMARY AND SECONDARY (799)

17.1/100,000 (U.S. 17.2/100,000)

The increase from 1988 of primary and secondary (P&S) syphilis continued throughout 1989 and the number of reported cases rose by 56% (Figure

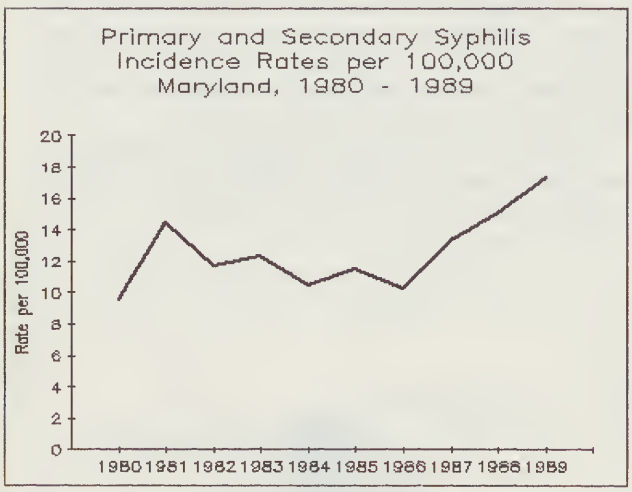

Figure 19

19). Early syphilis, which includes primary, secondary and early latent, was up over 70% from 1988. The cases by year for 1985 through 1989, as well as the reported cases by county for 1989 are presented in Table 1 (see July, 1990 issue).

More than half (50.9%) of all P&S cases were reported by Prince George's County; two zip code areas which border Washington, D.C. (NE and SE) were responsible for 25% of the early syphilis morbidity in Maryland. (These areas also lead the State in the number of teenage pregnancies, and have high HIV seropositive rates).

The male to female ratio was 1.3 to 1.0. More than 25% of the patients were 25 to 29 years of age. Blacks represented 66.0% of the cases.

As the sexual perference of reported early syphilis cases changed from homosexual to heterosexual (believed, to be due to safer sex practices in the gay community), the number of reported congenital syphilis cases increased dramatically. More than 65 pregnant women with syphilis were reported, and 29 of them delivered babies with congenital syphilis. Five of these babies were stillborn; four of the five mothers received no prenatal care, and the one who did, waited until her 6th month to do so.

TUBERCULOSIS (404)

8.7/100,000 (U.S. 8.7/100,000)

A 13.3% decrease from 1988 was reported in 1989. Five counties (Dorchester, Montgomery, Prince George's, Queen Anne's and Wicomico) and Baltimore City showed rates per 100,000 population above the rational rate.

The distribution of the cases by age groups is illustrated in Figure 21). The mean and median ages were respectively 47.9 and 47.0 years. The male to female ratio was 1.5:1.0 (the sex of 4 patients was not specified). The white to nonwhite ratio was 0.5:1.0.

A match of the tuberculosis and AIDS registries for 1989 disclosed 26 (6.4%) of the TB cases had AIDS.

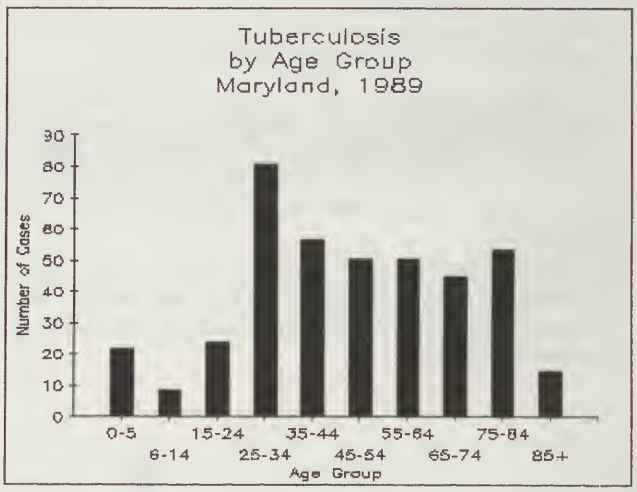

Figure 20

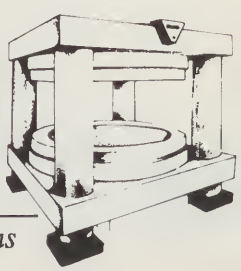
TYPHOID FEVER (12)

0.3/100,000 (U. S. 0.2/100,000)

Reported typhoid fever cases doubled in 1989 as compared to 1988. The cases occurred throughout the year in Montgomery (8), Baltimore (2) and Prince George's counties. The male to female ratio was 0.7:1.0.

The age ranged between 11 months and 25 years (median 25 years). All infections were imported from India (4), Korea (1), Central (2) and South America (3) and Africa (2). These include an 11 month old baby who was exposed to her Ghanaian baby-sitter, and a 5 year old boy who was exposed to his Indian mother. Both the baby-sitter and the mother were documented to be carriers of S. typhi.

A MEDICAL TEST SHOULD **NOT** SCARE PEOPLE HALF TO DEATH!



Having a health problem is scary enough. Finding out what is wrong doesn't have to be! In our state-of-the-art ACCESS™ MRI system with its "open-air" design, people don't feel like they are in a tunnel with a train coming at them. We can scan patients for whom conventional MRI is impossible. We can scan claustrophobics, the obese (up to 400 pounds), the elderly and pediatrics. Our team of trained professionals will help your staff provide the best care available to your patients.

At the Greater Baltimore MRI Center, Inc., we make it easier for you to diagnose your patients' problems.

Physician Rehabilitation Committee

Adjuvant Therapy for Carcinoma of the Colon

Adjuvant therapy is a therapeutic modality initiated within four weeks of potentially curative surgery in patients at high risk of recurrence or metastases such as those with Dukes' B or C carcinomas. Recent evidence from a number of clinical trials indicates that adjuvant chemotherapy for colorectal cancer has altered the natural history of the disease, resulting in a prolongation of the disease-free survival and overall survival.

Between 1977 and 1983, 1,166 patients with Dukes' B and C carcinoma of the colon were randomized in NSABP Protocol C-01 to receive (1) no further treatment following curative resection, (2) chemotherapy in the form of Methyl-CCNU + 5-FU + vincristine, or (3) nonspecific immune stimulation by BCG. At 92 months of follow-up, there is a statistically significant advantage in disease-free survival for those patients who received adjuvant chemotherapy when compared to the untreated control ($P = 0.03$). This difference also was noted in overall survival, which was statistically significant with $P = 0.04$.[1] Similarly, the efficacy of chemotherapy in the adjuvant setting has been documented in patients with carcinoma of the rectum, both in the NSABP studies (Protocol R0-1) and the Gastrointestinal Tumor Study group with added postoperative irradiation.

In the same time, preclinical pharmacologic interactions predicted increased efficiency of 5-FU with the addition of leucovorin. At Roswell Park Memorial Institute, a prospective controlled randomized clinical trial confirmed that high-dose leucovorin with 5-FU has a much higher response rate in patients with metastatic colorectal cancer.[2] The gastrointestinal toxicity, mainly in the form of severe diarrhea, is a serious side effect for patients receiving leucovorin modulated 5-FU, especially during the first course. Failure to modify doses or failure to provide IV supportive care, can result in fatal gastrointestinal/renal toxicity.

Furthermore, between 1978 and 1984, 408 patients with Dukes' B and C carcinoma of the colon (with the exception of 7 percent who had rectal lesions) were studied by the North Central Cancer Treatment Group (NCCTG) Protocol 78-4852. They were randomized postoperatively to receive (1) no further treatment (control), (2) levamisole, (3) or levamisole + 5-FU. After eight years of follow-up, both study arms of levamisole alone and 5-FU + levamisole have demonstrated superior disease-free survival, compared to the untreated control. There is significant survival advantage especially in the Dukes' C group who were treated with 5-FU + levamisole. An intergroup study (INT0035), initiated in January 1985 accessed over 1,200 patients and confirmed the results from the previous study.

Viewed cumulatively, the data thus far indicate that adjuvant chemotherapy is of benefit in patients with Dukes' B and C carcinoma of the colon and that the addition of levamisole to 5-FU has provided a significant advantage relative to disease-free survival. Therefore, it is compelling to assess whether the addition of levamisole to the leucovorin-modulated 5-FU regimen would provide an additional benefit. Such a study should also determine whether leucovorin-modulated 5-FU used alone would be superior to 5-FU + levamisole (a regimen attractive for its case administration, acceptable toxicity, and relatively low cost).

Based on the above facts, the NSABP established protocol C-04 in which patients who have undergone curative resection of Dukes' B or C carcinoma of the colon are randomized to receive one of three treatment options: (1) 5-FU+leucovorin, (2) 5-FU + levamisole, (3) 5-FU+leucovorin+levamisole. This study is open for patient accrual.

THE MRI CENTER AT MARYLAND GENERAL HOSPITAL
A NEW RESOURCE FOR MARYLAND PHYSICIANS

Maryland General Hospital has installed a Picker Vista MRI 1.0 Telsa Scanner. This system permits high resolution, thin slice imaging capability and small fields of view, all with superior image quality.

Our System and services offer many benefits to area physicians...

- Convenient patient appointments.
- A dictaphone voice retrieval system which allows instant access to dictated MRI reports from any telephone including home, office or even car phones.
- A large magnet gantry and table to accommodate large or obese, and claustrophobic patients up to 300 lbs.
- Twenty-four hour or less report turn around.
- A financial counselor to facilitate MRI payments.
- Actual copy of study available to physician upon request.

Listen to your peers. They tell us

THE MEDICAL MANAGER® Is Peerless!

For years we've been telling you that The Medical Manager® from PRISM Medical Systems is the best software for your medical practice. Now it's time for some of our users, physicians and office managers, to tell you.

"We have found that PRISM understands medical office function better than other vendors we spoke to. PRISM best met our needs with hardware and software and training. I really appreciate being able to call and talk about our problems, no matter how simple or complex."

—Northern Virginia Pulmonary Associates

PRISM Medical Systems is the largest dealer of The Medical Manager® in the Mid-Atlantic states. Users agree that this medical practice management software package streamlines office organization and improves collections. With more than 8,000 systems installed nationwide, The Medical Manager® surpasses its competition. Satisfied users agree.

"We felt that the increased flexibility and versatility of The Medical Manager® would provide us with a system that would grow along with us and adapt to the demands of our practice. No other system we looked at was able to monitor the multiple and changing components of our practice as effectively and detailed as The Medical Manager.® The enhanced scheduling program will be a life saver for us, with our complex assortment of patients and practitioners."

—Scandia Centrum

For more information about The Medical Manager® contact your nearest PRISM office or call us toll free.

Executive Director's Newsletter

September 1990

New Date and Location for Med Chi Semi-Annual Meeting

Due to circumstances beyond our control, **Med Chi's Semiannual meeting will be on Friday-Sunday September 14-16, 1990, at the Carousel Hotel and Resort in Ocean City.** The Royal Princess Ocean Suite Hotel will not open in time to host our meeting because of construction delays. The move to the Carousel resulted in several changes in the preliminary program for the meeting. A program update follows this *Newsletter*.

Med Chi will conduct all business meetings at the Carousel. Council will meet on Friday, September 14 at 3:00 p.m. and the House of Delegates will convene on Saturday, September 15 at 1:00 p.m.

Scientific sessions at the meeting include many clinical topics such as interventional radiology, diagnosis and treatment of LVH, and hypertension. Other sessions will address socioeconomic concerns such as physician payment reform, the Maryland Access to Care program, government regulations, and physician retirement. On Sunday, September 16, Med Chi will feature several AMA Videoclinics on various subjects including AIDS, hypertension, cholesterol, and neurology. Med Chi designates continuing medical education activities at the meeting for 12 credit hours in Category I of the AMA Physicians Recognition Award.

One of the technical exhibits at the Semiannual meeting will feature a booth on Health Access America, a new AMA proposal to improve access to affordable, quality healthcare. Sponsored by Med Chi's Committee on Public Health, this booth will provide physicians with valuable information regarding the future direction of our nation's healthcare system.

Make arrangements now to attend the meeting. The Carousel Hotel and Resort offers excellent meeting facilities and is providing Med Chi members with a reduced room rate. For hotel reservations call the Carousel at 1-800-641-0011. For registration infromation contact Ralph Tyksinski, in Med Chi's Office of Education and Meetings Management at 301-539-0872 or toll free 1-800-492-1056.

Drug Conference

Med Chi encourages all physicians to attend "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician," on October 20-21 at the Baltimore Convention Center. Sponsored by Med Chi's Committee On Drugs, this conference will feature Sidney Schnoll, M.D., Ph.D. and Robert DuPont, M.D. who will address issues such as, how to recognize an addict and clinical guidelines for treating chemical dependency. Herbert D. Kleber, M.D., Deputy Director for Demand Reduction in the Bush Administration, will speak on the epidemiology of drug abuse.

Approved for 12 hours in Category I of the AMA Physicians Recognition Award and accepted for 12 prescribed hours by the American Academy of Family Physicians, this conference provides essential information to help physicians obtain a working knowledge of the drug problem and teaches practical treatments to benefit patients.

Since registration is limited, please call now to insure your space at the conference. Tuition is $75 for Med Chi members and $100 for non-members. To receive a conference brochure or to register by phone or for more information call Vivian Smith, Public Relations Assistant at 301-539-0872 or toll free 1-800-492-1056.

Doctor/Lawyer Partnership Against Drugs

Med Chi is seeking physician volunteers who are willing to participate in a Doctor/Lawyer Partnership Against Drugs. This joint effort between Med Chi and the Maryland Bar Association will bring doctor/lawyer education teams into schools to discourage 7th graders from using drugs. During this "rap-session," the physician will focus on the physical dangers of drug abuse while the lawyer will emphasize the legal consequences of using drugs. For more information about how to become involved in this effort, contact your local component society or call Med Chi's Public Relations Department at 301-539-0872 or toll free 1-800-492-1056.

National Practitioner Data Bank

The National Practitioner Data Bank, a central data bank that serves as a nationwide repository for information related to professional conduct and competence, licensure status, and the malpractice claims of physicians, is scheduled to open in late August or September 1990. Established by Congress in the Health Care Quality Improvement Act of 1989, the Data Bank is intended to protect the public from incompetent physicians and to provide an incentive and protection for physicians engaging in effective peer review by providing immunity from liability for damages resulting from good faith peer review activities.

To help physicians better understand the functions of the Data Bank, the AMA recently released, "Informing Physicians About the National Practitioner Data Bank," a booklet designed to alert physicians about how the Data Bank will operate and the risks involved in broad dissemination of information reported. To obtain a free copy of this booklet, call Med Chi's Communications Department at 301-539-0872 or toll free 1-800-492-1056.

Congress Proposes 1991 Balance Billing Limits

Med Chi urges physicians to contact their Congressional Representatives regarding a proposal to impose balance billing limits of 125% of the local prevailing charge (or a physician's 1990 MAAC, whichever is less) on all services starting January 1, 1991. These limits would take effect one year prior to the implementation of the Resource Based Relative Value Scale (RBRVS). The proposed limits would significantly lower revenues for medical services actually scheduled for increases in 1992 under the RBRVS.

To prevent this situation, the AMA is proposing Congress adopt a one year, across-the-board, budget neutral delay of the 1991 balance billing limits. A delay of this proposal is simple and would not result in any additional cost to the government.

To delay these limits, physicians should contact their congressional representatives and urge them to support the AMA's proposal. To telephone Senators and Representatives in Washington, call 202-224-3121. When "the Capitol" answers, ask for your Senators and Representatives by name and state.

For more information regarding this proposal, contact Betsy Newman in Med Chi's Public Relations Department at 301-539-0872 or toll free at 1-800-492-1056.

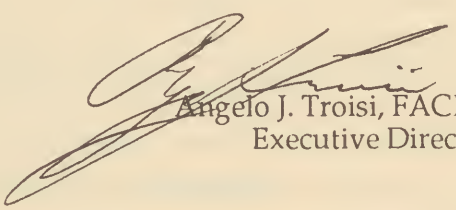
Address Verification Forms for Med Chi Membership Directory

This month all member physicians will receive green address verification forms for the *1991 Med Chi Membership Directory*. When you receive this form, check the address printed on the form with your current office address and your current mailing address and make certain your medical specialty code number and board number are correct. Please note any changes of address or specialty code and board number on the form and return the form to Med Chi. If the form is printed correctly, you do not need to return the card. For questions regarding the address verification

form, contact Wanda Griebel in Med Chi's Membership Department at 301-539-0872 or toll free 1-800-492-1056.

Specialist Identifier

Physicians are reminded that they may not legally represent to the public, including in advertisements and the yellow pages, that they are a specialist in any field of medical practice unless identified as such by the Board of Physician Quality Assurance.



Application for specialty designation is open to all licensed physicians in Maryland. If a physician is certified by the American Board of Medical Specialists, the identification is automatically given by the Board upon confirmation of that credential. If not certified by the American Board of Medical Specialists, the physician must complete an application outlining specific training and experience in the requested specialty. Applications are referred to the Med Chi Committee on Specialist Identification for evaluation and recommendation to the Board. The criteria used for such evaluations were developed jointly by Med Chi and the Board and are set forth in administrative regulations having the force and effect of law. To apply for specialty board certification, contact the Board of Physician Quality Assurance at 301-764-4777.

Murray to Head County/State Relations

Michael A. Murray, who was Assistant Executive Director of Med Chi for 13 years before joining the AMA staff in March, recently was appointed Director of AMA's Office of County/State Relations. Mr. Murray's promotion brings a Maryland perspective to the leadership of the AMA and adds strength to Med Chi/AMA relations. Med Chi congratulates Michael A. Murray on this outstanding achievement.

Durable Power of Attorney and Living Wills

Following this *Newsletter* is a Durable Power of Attorney form and a Living Will form. As a result of the recent Supreme Court Decision, *Cruzan vs. Director, Missouri Department of Health*, it is recommended that both documents be executed jointly to permit the appropriate legal process of the living will in cases involving patients determined to be in a persistent vegetative state. This case demonstrates that there needs to be clear and convincing evidence of a person's intent. The execution of both documentss clearly establishes such intent. For questions regarding either form, contact Greg Hall at the Faculty 301-539-0872 or toll free at 1-800-492-1056

Angelo J. Troisi, FACHE
Executive Director

DECLARATION OF LIFE -SUSTAINING PROCEDURES (LIVING WILL)

On this _____ day of _____, 19____, I, _____, being of sound mind, willfully and voluntarily direct that my dying shall not be artificially prolonged under the circumstances set forth in this Declaration:

If at any time I should have any incurable injury, disease or illness certified to be a terminal condition by two (2) physicians who have personally examined me, one (1) of whom shall be my attending physician, and the physicians have determined that my death is imminent and will occur whether or not life-sustaining procedures are utilized and where the application of such procedures would serve only to artificially prolong the dying process, I direct that such procedures be withheld or withdrawn, and that I be permitted to die naturally with only the administration of medication, and the performance of any medical procedure that is necessary to provide comfort, care or alleviate pain. In the absence of my ability to give directions regarding the use of such life-sustaining procedures, it is my intention that this Declaration shall be honored by my family and physician(s) as the final expression of my right to control my medical care and treatment.

I (do) (do not) *[draw a line through word(s) that do(es) not apply]* want food and water or other nutrition and hydration administered to me by tube or other artificial means in the event that I am in a terminal condition.

I am legally competent to make this Declaration, and I understand its full impact.

_____
(Signature of Declarant)

_____

_____
(Address of Declarant)

Under the penalty of perjury, we state that this Declaration was signed by _____ in the presence of the undersigned who, at request, in our presence, and in the presence of each other, have hereunto signed our names as witnesses this _____ day of _____, 19_____. Further, each of us, individually, states that: The Declarant is known to me, and I believe the Declarant to be of sound mind. I did not sign the Declarant's signature to this Declaration. Based upon information and belief, I am not: related to the Declarant by blood or marriage; a creditor of the Declarant, entitled to any portion of the estate of the Declarant under any existing testamentary instrument of the Declarant; entitled to any financial benefit by reason of the death of the Declarant; nor financially or otherwise responsible for the Declarant's medical care or an employee of any such person or institution.

DURABLE POWER OF ATTORNEY FOR HEALTHCARE

1. **Designation of Healthcare Agent**

I, _____, hereby appoint

_____ Name

_____ Home Address

_____ Home Telephone Number

_____

_____ Work Telephone Number

_____

as my agent to make healthcare decisions for me as authorized in this document.

If the person named as my agent is not reasonably available or is unable to act as my agent, then I appoint the following person to serve in that capacity:

_____ Name

_____ Home Address

_____ Home Telephone Number

_____

_____ Work Telephone Number

_____

2. **Creation and Effectiveness of Durable Power of Attorney for Healthcare**

With this document I intend to create a durable power of attorney for healthcare, which shall take effect when and if two physicians, one of whom is my attending physician, certify that I am disabled because I lack sufficient understanding or capacity to make or communicate decisions with respect to my own health care. The power shall continue in effect during my disability.

3. **General Statement of Authority Granted**

Except as indicated in Section 4, below, I hereby grant to my agent named above full power and authority to make healthcare decisions on my behalf; including the following:

(1) To request, review and receive any information, verbal or written, regarding my physical or mental health, including, but not limited to, medical and hospital records, and to consent to the disclosure of this information;

(2) To employ and/or discharge my healthcare providers;

(3) To consent to and authorize my admission to and discharge from a hospital or related institution;

(4) To give consent for, or to withhold consent for, x-ray, anesthesia, medication, surgery and all other diagnostic and treatment procedures prescribed (ordered) by or under the authorization of a licensed physician, dentist or podiatrist. This authorization specifically includes the power to consent to measures for relief of pain.

(5) To direct the withholding or withdrawal of life-sustaining procedures or measures when and if I am terminally ill or permanently unconscious. Life-sustaining procedures or measures are those forms of medical care which only serve to artificially prolong the dying process, and may include mechanical ventilation, dialysis, antibiotics, artificial nutrition and hydration, and other forms of medical treatment which stimulate or maintain vital bodily functions. Life-sustaining procedures do not include care necessary to provide comfort or alleviate pain.

(6) To take any lawful actions that may be necessary to carry out these decisions, including the granting of releases of liability to medical providers.

4. **Special Provisions and Limitations**

In exercising the authority under this durable power of attorney for healthcare, the authority of my agent is subject to the following special provisions and limitations:

_____

_____

_____

_____

5. **Guardianship Provision**

If it becomes necessary for a court to appoint a guardian of my person, I nominate my agent or successor agent named above to be the guardian of my person.

6. **Signature of Principal**

By signing here I indicate that I understand the purpose and effect of this document.

_____ _____
Signature Date

7. **Signature of Witnesses**

I declare that the person whose signature appears on this document signed or acknowledged the document in my presence and that I am not the person appointed as agent by this document.

Semiannual Meeting

Medical and Chirurgical Faculty of Maryland

NEW DATES:
September 14, 15, 16, 1990
Friday, Saturday, Sunday

NEW LOCATION:
Carousel Hotel and Resort
Oceanfront at 118th Street
Ocean City, Maryland

Program Update

The Medical and Chirurgical Faculty of Maryland is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to sponsor continuing medical education for physicians.

1990 Semiannual Meeting

Carousel Hotel & Resort, 118th Street - Beach Side, Ocean City, Maryland

Friday, September 14, 1990

12:00 noon - 3:00 p.m. The Carousel Club Room	**Auxiliary Luncheon and Business Meeting** * All Med Chi Physicians and Spouses are welcome to attend this special buffet luncheon. (Tickets may be purchased at the registration desk.)
1:00 p.m. - 5:00 p.m.	**Registration -- Exhibits Open**
2:00 p.m. - 3:00 p.m. Maryland/Virginia Room	**Opening Remarks** -- Reynaldo L. Lee-Llacer, M.D., President **Keynote Speaker** Robert McAfee, M.D., AMA Trustee
3:00 p.m. - 5:30 p.m. Maryland/Virginia Room	**COUNCIL MEETING** Call to Order -- Marvin Schneider, M.D., Chairman
3:30 p.m. - 5:30 p.m. Washington Room	**"New Options for Computers in the Medical Office" --** Workshop presented by the Med Chi Committee on Computers in Medicine. Rafael Haciski, M.D., Moderator Panel to be announced

Saturday, September 15, 1990

8:30 a.m. - 5:00 p.m.	**Registration -- Continental Breakfast -- Exhibits Open**
9:00 a.m. - 10:30 a.m. Maryland/Virginia Room	**Symposium -- "Maryland Access to Care" --** Gary Rosenberg, M.D., Moderator Mary Mussman, M.D., Advisory Physician, Policy & Health Statistics, DHMH Mr. Nelson Sabatini, Dep Secty, Health Care Policy Finance & Regulation, DHMH
10:30 a.m. - 11:00 a.m.	**Break -- Visit Exhibits**
11:00 a.m. - 12:00 noon Maryland/Virginia Room	**"The AMA's Health Access America"** Henry Maganzini, M.D., Chairperson, Med Chi Committee on Public Health
12:00 noon - 1:00 p.m.	**Lunch on your own -- Visit Exhibits**
1:00 p.m. Maryland/Virginia Room	**HOUSE OF DELEGATES** Call to Order -- Reynaldo L. Lee-Llacer, M.D., President
3:00 p.m. - 3:30 p.m.	**Break -- Visit Exhibits**
3:30 p.m. - 5:45 p.m. Maryland/Virginia Room	**"Regulatory Impact on Physicians' Office Practices"** Gerard E. Evans, Esq., Moderator Alan Rifkin, Esq., Rifkin, Evans, Silver, and Lamone Jack De Boy, Dr. P.H., Assistant Director, Laboratory Admin., DHMH Mr. Jack Emery, Assistant Director, AMA Department of Federal Affairs
6:00 p.m. - 7:00 p.m. Lower Le Jardin	**"Royal Reception"** All Physicians, Spouses and Exhibitors Welcome
7:00 p.m. - 10:00 p.m. Delaware Room	**Philippine Medical Association of Metropolitan, Washington, D.C., Dinner and Business Meeting**

Sunday, September 16, 1990

8:30 a.m. - 12:00 noon	**Registration -- Continental Breakfast -- Exhibits Open**
9:00 a.m. - 10:00 a.m. Maryland Room	**"New Directions in Continuing Medical Education on Substance Abuse"** -- Sidney Schnoll, M.D., Ph.D., Division of Substance Abuse, Medical College of Virginia
9:00 a.m. - 10:00 a.m. Virginia Room	**"Diagnois and Treatment of LVH"** John Gottdiener, M.D., FACC, Georgetown University School of Medicine
9:00 a.m. - 10:30 a.m. Washington Room	**"Physicians' Transition to Retirement"** -- A workshop on retirement planning for physicians and spouses. Presented by Representatives from the First National Bank of MD and Toback & Company, Inc., CPAs
10:30 - 11:00 a.m.	**Break -- Visit Exhibits**
11:00 a.m. - 12:00 noon Maryland Room	**"Physician Payment Reform"** Guest Speaker from Health Care Financing Admin., Philadelphia Office
11:00 a.m. - 12:00 noon Virginia Room	**"Interventional Radiology"** -- Fred Osterman, M.D., Chief of the Division of Interventional Radiology, Johns Hopkins University School of Medicine
11:00 a.m. - 12:00 noon Washington Room	**"Threats to Public Health: Violence, Victims of Violence, and Victimization. What Can Physicians Control ?"** Beverly Coleman-Miller, M.D., Special Assistant for Medical Affairs to the Commissioner, Commission of Public Health, Washington, D.C.
12:00 noon	**Exhibits Close**
1:00 p.m. - 5:00 p.m.	**AMA Videoclinics** Stroke (2 hours - Cat. 1) Healthier Youth by the Year 2000 (1/2 hour - Cat. 2) OB/GYN: Updates in Clinical Practice (1/2 hour - Cat. 2) AMA Update : Hypertension: A New Perspective (1/2 hour - Cat. 1) AMA Update: HDL Cholesterol Management (1/2 hour - Cat. 1) AMA Special Report: Highlights of the AMA Annual Meeting (1/2 hour - Cat. 2) AMA Special Report: Highlights of the AMA/HIV and International AIDS Conference (1/2 hour - Cat. 2) Ultrasound Imaging: New Frontiers in Diagnostic Imaging (1/2 hour - Cat. 2) AMA Update: Panic Disorder (1/2 hour - Cat. 1) When the Diagnosis is Family Violence (1/2 hour - Cat. 2)

Adjournment

The Medical and Chirurgical Faculty designates this continuing medical education activity for 12 credit hours in Category I of the Physicians Recognition Award of the American Medical Association. ***A Certificate of Attendance will be issued.*** Appropriate CME credit has been requested from other medical specialty societies.

Adele Wilzack, R.N., M.S.
Secretary

Dear Physician:

As you may already have heard, the State of Maryland will be changing the way it offers primary medical care and physician-ordered services to many Medicaid patients. The change represents a commitment by the Medicaid Program to shift care to community providers and, at the same time, increase fees for cognitive visits (by an average of 50%).

Under the new Maryland Access to Care (MAC) Program, scheduled to begin early next year, most Medicaid recipients will be required to choose a physician, physician group, or clinic to serve as their primary care provider. Recipients who fail to select a primary care provider will be assigned one. Any time the recipient needs medical care, except in an emergency, he or she must call the primary care provider for an appointment or a referral to another source of care if appropriate. The primary care provider's Medicaid number must appear on the bill of the referred physician in order for payment to be made.

The State of Maryland and the Medical and Chirurgical Faculty encourage you to participate in this new program. We believe that this change will improve the continuity and quality of care for Medicaid recipients: physicians will have an established panel of patients; and, conversely, patients will have a medical "home." The attached article describes the program in more detail.

Nelson J. Sabatini
Deputy Secretary
Health Care Policy,
Finance and Regulation

Maryland Access to Care

Promoting Primary Care for the Medical Assistance Population

We would like to introduce you to MAC - The Maryland Access to Care Program. The MAC program will link Medical Assistance recipients with providers in an effort to decrease inappropriate use of the health care system and increase preventive and primary care. MAC cannot be successful without the participation of physicians. Therefore, as an incentive to participate, physicians will receive up to a 50% fee increase for most primary care services. We believe, that with the help of physicians, this program can address the needs of both physicians and patients. Physicians will receive increased fees and a greater degree of control over their patient populations. Patients will get better continuity of care and assured access. The end result will be a high quality, cost-effective health care system.

Non-urgent care provided in the emergency room is a concern not only because it is at least three times as expensive as comparable primary physician care, but also because the patient does not receive the continuity of care and follow-up provided in a primary care setting. For example, analysis of Medicaid data shows that, the women least likely to receive a PAP test are those whose usual source of care is an emergency room. ER users, overall, have the lowest average number of ambulatory visits per year.

In response to this, the Maryland Medical Assistance Program, has introduced a number of initiatives aimed at promoting primary care for high cost sub-populations where targeted prevention efforts could be both cost-effective and beneficial. These programs include: the Pregnant Women and Children's Program, which expands eligibility for pregnant women and children, the Healthy Start Program, which expands coverage of prenatal care services, and the Multiple Prescriber Program, which is aimed at decreasing the problem of contra-indicated drug prescriptions for the elderly. Additionally, work is under way for a managed care and preventive services program for people with diabetes.

Among the most important goals of the Medical Assistance Program, as demonstrated by these initiatives, is the promotion of high quality primary care. Quality primary care provides continuity and coordination of care, as well as, prevention-oriented services. These factors, in turn, both prevent unnecessary hospitalization and emergency room use and improve the health status of Medical Assistance recipients. The benefits of primary care for recipients can be maximized by replacing a system that encourages episodic, crisis-oriented care from a variety of unrelated providers with a program that promotes continuity of care through a single provider. Health problems can then be identified and treated early in an office-setting, thus delaying, or avoiding entirely, more costly types of care.

Medical Assistance recipients have more chronic illness, higher death rates from preventable diseases, and a greater likelihood of having multiple health problems. At the same time, they are far less likely to have a primary care provider and more likely than those with private insurance to rely on emergency rooms and outpatient departments as their main source of care.

Through MAC, approximately 230,000 Medical Assistance recipients, 75% of whom are AFDC mothers and children, will be linked with a primary care provider, who will coordinate care and act as a point-of-access for the patient's use of the health care system. Recipients will have the opportunity to choose a provider either by phone, by mail, or by signing up through their current provider. If recipients do not choose, Medical Assistance will assign them to a provider in their health service area. Emergencies and care provided once the patient is admitted to an institution will not require pre-authorization. Recipients may change providers any time for an acceptable reason and every twelve months without cause.

Provider types eligible to participate in MAC include: Family Practice, General Practice, Pediatrics, Internal Medicine and Nurse Practitioners. Under certain circumstances, a specialty physician not listed above may be designated as a MAC provider when it is in the best interest of, and requested by, the recipient. MAC providers may practice in the following settings; private practice, Community Health Centers, group physician practices, Children and Youth Clinics, Community Mental Health Centers and other types of free-standing clinics.

Upon enrollment with MAC, a provider can indicate if s/he wishes to limit the number of recipients to be assigned to him/her through MAC. Providers can also opt to only take patients who actively choose their practice, rather than taking patients that have been assigned by Medical Assistance. Providers should be aware that if they do not enroll in the MAC program, they risk losing their current Medical Assistance population to other providers who do choose to participate.

Responsibilities of the MAC provider include:

1) Provide comprehensive primary health care services to all eligible Medical Assistance recipients who choose or are assigned to them.

2) Maintain 24 hour/7 day a week availability through call arrangements or back-up coverage.

3) Refer recipients for specialty care, non-emergency hospital admissions, and non-emergent care in the emergency room. (The MAC provider's Medicaid number must appear in the referral slot on billing forms of other providers in order for the bill to be paid.)

4) Furnish services during a regular schedule of office hours, including a minimum of 20 hours per week over no fewer than three days of the week, except when otherwise approved by the Medical Assistance Program.

5) Maintain a single patient record on each recipient and, for group practices or clinics, designate a single provider within the group as the principle provider for a recipient.

6) If the MAC provider agrees to care for children, s/he must either provide EPSDT/Healthy Kids services or assure the provision of such services.

As always, providers have the right to refuse to accept a patient, as well as terminate a relationship, for a reason that is not discriminatory.

Savings from MAC will allow a fee increase of up to 50% more for most cognitive visits to accompany the additional responsibilities of providers. For example, reimbursement for an intermediate visit with an established patient will increase from $21.00 to $32.00 and an intermediate visit with a new patient will increase from $21.00 to $37.00 with the implementation of MAC. Because the fee increase is so closely tied to program savings, only providers in those counties that fully participate in MAC, i.e. where there are enough providers to match all MAC recipients, will receive the fee increase. We are, however, proceeding on the assumption that there will be enough providers in each county to implement MAC statewide.

The Maryland Access to Care Program is similar to programs either in operation or being implemented across the country. States with programs already in place include: Kentucky, Utah, Michigan and Colorado. Independent surveys of physicians in other states show growing support for programs similar to MAC. Physicians in Kentucky concluded that their program assures increased quality of care for patients, strengthens the doctor/ patient relationship and provides the opportunity for improved continuity of care. In Colorado, 74% of doctors surveyed cited increased physician control over the patient's use of health care services as a strong benefit to the program. Patients have shown similar satisfaction with the programs. 80% of recipients stay with the physicians with whom they are initially linked. Colorado recipients showed a high rate of satisfaction with patient/provider relationships. Other states have shown similar satisfaction rates regarding access to specialists, quality of care received in general, and increased continuity of care.

MAC is essentially a provider-run program; it cannot work without the participation of physicians. In addition to the fee increase already mentioned, MAC offers additional incentives to providers. The MAC provider will have more control over a patient's use of services, and the opportunity to establish a more productive doctor-patient relationship. This improved relationship should lead to

greater compliance with the recommended treatment plan, in addition to, more opportunities to change client behavior through patient education.

The Medical Assistance Program believes that encouraging rational utilization of the health care system can be accomplished within the existing fee-for-service model. As such, MAC providers are not financially at risk for the cost of primary care or any other services rendered to MAC patients. All Medicaid-covered services that are referred by the patient's primary medical provider will be reimbursed on a fee-for-service basis. This will allow emphasis to remain on identifying and coordinating needed services while, at the same time, decreasing unnecessary or duplicative services.

In preparation for the implementation of MAC, we are urging recipients to use the Physician Referral Service to find a physician they may choose to become their MAC provider. This toll-free service links recipients with primary care providers in their communities. You may wish to have your practice listed with this service.

Implementation of MAC is a major change for the Medical Assistance Program. For a majority of recipients, the State is shifting from being an enabler for the receipt of service (we provide the insurance card and it is up to the patient to find someone to provide the service), to actively linking recipients with providers. The Maryland Medical Assistance Program is strongly committed to MAC and its potential for improving primary care. As stated before, however, the program will not succeed without strong physician support.

We have established, and will continue to work closely with, an Advisory Committee with representatives of all provider types. We encourage physicians to provide input, either through their local medical society, or by calling DHMH staff at the numbers listed below to make suggestions, express concerns or ask questions.

We believe that MAC, by ensuring continuity and coordination of care, as well as facilitating appropriate utilization of services, will result in more responsible use of public funds and improved primary care for patients. Your comments, suggestions, and participation will help ensure the success of Maryland Access to Care.

The following DHMH staff are available for comments at (301) 225-5806:

Mary Mussman, M.D., M.P.H.

Medical Specialty Identification

The Board of Physician Quality Assurance has adopted COMAR 10.32.09 Identification of Medical Specialties, in order to implement Health Occupations Article 14-704, which provides for the identification of medical specialists by the Board. **A physician may not represent to the public in Maryland that he is a specialist in any field of specialized medical practice unless identified as a specialist in that field by the Board.**

There are two ways to become identified as a medical specialist. They are:

A. Specialty Board certification.

If you qualify as a medical specialist because of specialty board certification, please enclose a $5 fee for each specialty requested and a photocopy of your certification.

B. Evaluation of credentials by a Medical Review Committee.

If you are not American Board of Medical Specialties (AMBS) specialty or subspecialty board certified but wish to be credentialed as a medical specialist in any field of medicine through evaluation of credentials, education, and experience, please enclose a $15 evaluation fee plus a $5 identification fee for each specialty requested). The evaluation form will then be sent to you.

PIE's quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. PIE Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

QRP FACTS:

Strict Underwriting Criteria – Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

Scheduled Premium Reductions – Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

High Limits – Backed by our reinsurer, Lloyd's of London, PIE is able to offer higher coverage limits for qualifying doctors: up to $7 million for individual doctors and $13 million for group policies. Lloyd's of London is the largest reinsurer in the world.

Designed With Input from Doctors – PIE's QRP plan is an innovative modified claims-made insurance specially designed with input from PIE-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your PIE representative, or our headquarters office today.

YOUR OFFICE STAFF WOULD LIKE TO HAVE A WORD WITH YOU

If you're suffering from an upset staff due to billing frustration and overexertion, CADO SYSTEMS has the right prescription for a healthier practice — MENDS II, from VERSYSS INCORPORATED (formerly Contel Business Systems). With over 3,000 installations nationwide, MENDS II is the practice management system designed with your office in mind. It can help you eliminate problems with your accounts receivable management. It can also assist your staff with patient tracking and follow-up, giving you better control of appointments, patient histories, and treatment scheduling. CADO is your single-source solution. From automatic insurance billing, electronic claims submission and general accounting to medical records, data base analysis and word processing, we take care of your practice so you can take care of your patients. We are the "one stop shop" for your entire computer system — including hardware and software selection, financing, installation, service and support.

CADO SYSTEMS has been serving the central Maryland area since 1981 and will continue to do so far into the future.

For you to benefit from our single-source expertise in health care computerization, call us at (301) 581-1212. When it comes to curing practice management problems, we are the specialists.

CADO SYSTEMS — WE OFFER PRACTICE MANAGEMENT SOLUTIONS, NOT JUST COMPUTERS!

CADO SYSTEMS — MARYLAND'S SOLUTION CENTER!

Venomous Snakebites

Barry S. Gold MD and Robert A. Barish MD

Dr. Gold has a private practice in Internal Medicine and is Medical Director of Medicare - State of Maryland. Dr. Barish is Director of Emergency Medical Service, University of Maryland Medical Systems, and Assistant Professor of Surgery and Medicine, University of Maryland.

As the incidence of snakebites increases, physicians need to be able to recognize venomous bites and to be familiar with current concepts in diagnosis, treatment, and management of snake envenomation.

Indiana Jones may have said it for everyone when he uttered "I hate snakes!" in his quest for *The Lost Ark*.

Most people in the United States not only agree with him but also are under the false impression that all snakes are poisonous. In reality, about 10 percent of approximately 2,500 species are venomous. As more Americans have taken to outdoor activities, there has been an increase in the occurrence and treatment of venomous and nonvenomous snakebites. Many physicians, unfamiliar with the recognition of venomous bites, may be anxious about treatment protocols, which are controversial even among snakebite authorities. Differences of opinion among experts have centered on the use of tourniquets, ice, antivenin, route of administration, and choice of wound exploration. It is necessary for all physicians to become familiar with current concepts in the mechanisms and treatment of snake envenomation (snake venom poisoning).

Venomous Snakes in the US

Only four types of venomous species of snakes are indigenous to the United States. Of these, three are of the subfamily known as pit vipers (*Crotalinae*): rattlesnakes, copperheads, and cottonmouths, commonly referred to as water moccasins. The coral snake (*Elapidae*) is the other native poisonous snake. At least one or more species of poisonous snake has been identified in every state except Alaska, Maine, and Hawaii.[1]

Pit vipers are distinguishable by a foramen, or pit, located between each eye and nostril. The pit is a heat-sensitive organ enabling the snake to locate warm-blooded prey during nocturnal foraging. They have elliptical pupils and two sharp, canalized fangs that are long and movable, retracting posteriorly when the mouth is closed. Occasionally one may see two fangs on one or both sides of the respective jawbones, representing part of the replacement series of fangs. At least three pairs of replacement

fangs, in various stages of development, lie behind each functional fang and move forward throughout the life of the snake to replace shed or broken fangs. Since fang replacement occurs at various intervals (weeks to months), no fangless or "defanged" snake remains harmless indefinitely. The pit viper's head appears triangular due to the venom glands located in the temporal region.

Rattlesnakes (*Crotalus*) and pygmy rattlesnakes (*Sistrurus*) have rattles attached to their tails. It is believed that the rattle functions as a warning device. The eastern diamondback rattlesnake (*C. adamanteus*) is considered to be the largest and most dangerous snake in the Southeastern US. It possesses large quantities of highly toxic venom.

Copperheads (*Agkistrodon contortrix*) have inverted Ys and hourglass configurations on their bodies. Their head varies in color from copper to various shades of brown. The majority of bites by copperheads do not result in fatalities, but severe bites that are not treated could result in death.[2] Cottonmouths (*Agkistrodon piscivorus*) are dark olive to black in color providing camouflage in swampy marshes. The pale white color of its oral mucosa is highly visible when its mouth is fully opened. A large snake, it is often aggressive when encountered, and its venom is moderately toxic. The cottonmouth is capable of biting while under water.

The coral snake (*Micrurus fulvius*) is a small, beautifully colored snake with broad rings of red, yellow, and black. A number of harmless snakes resemble the coral snake, but the broad bands of red and black separated by yellow rings help to differentiate the coral snake from nonpoisonous snakes with similar markings. Black and albino also have been identified. All coral snakes in the US possess black snouts, and round pupils, and lack facial pits. The coral snake is shy, secretive, and nocturnal; it rarely bites humans. It has short, fixed fangs that contain a potent neurotoxic venom (rarely fatal) that is injected into a victim by a succession of chewing movements.

Poisonous v. Nonpoisonous

A patient sometimes will bring the snake that has bitten him/her to the hospital or clinic. It is important that medical personnel be able to distinguish between a poisonous and a harmless snake. Harmless snakes in the US have round pupils and do not possess fangs, but they have small teeth that produce a typical bite pattern. Exceptions include a few species of rear-fanged *Colubridae* that have elliptical pupils but are not considered dangerous to man. In general, harmless snakebites are characterized by four rows of small scratches produced by the four rows of teeth in the snake's upper jaw, separated from two rows of small scratches produced by the two rows of teeth in the snake's lower jaw (Figure 1).

Occasionally a snake is brought to the hospital after its head has been chopped off and left at the site of the accident. Pit vipers can be identified by observing a single row of subcaudal plates just below the anal plate on the underside of the snake's tail. This is contrasted to harmless snakes that have a double row of subcaudal plates. Figure 2 compares venomous and nonvenomous snakes.

More often than not the snake is not available for

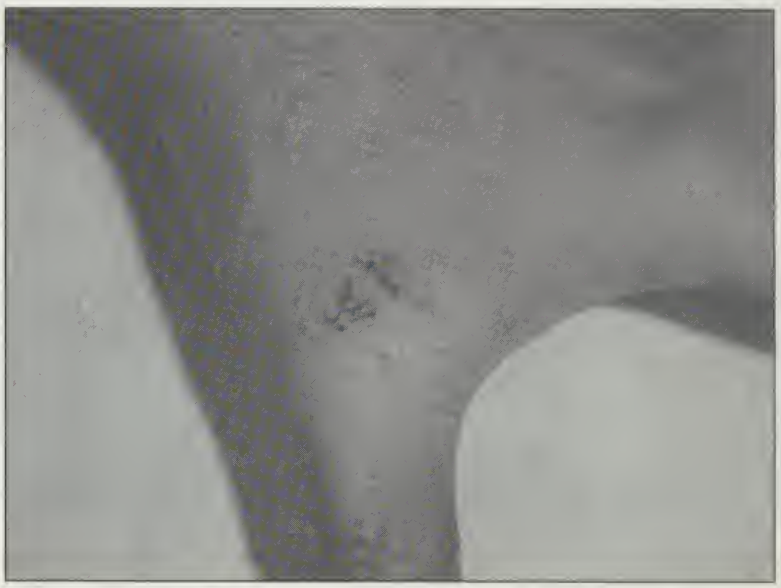

Figure 1. Characteristic pattern of a bite wound produced by nonvenomous snake. Note the four rows of teeth marks produced by the snake's upper jaw.

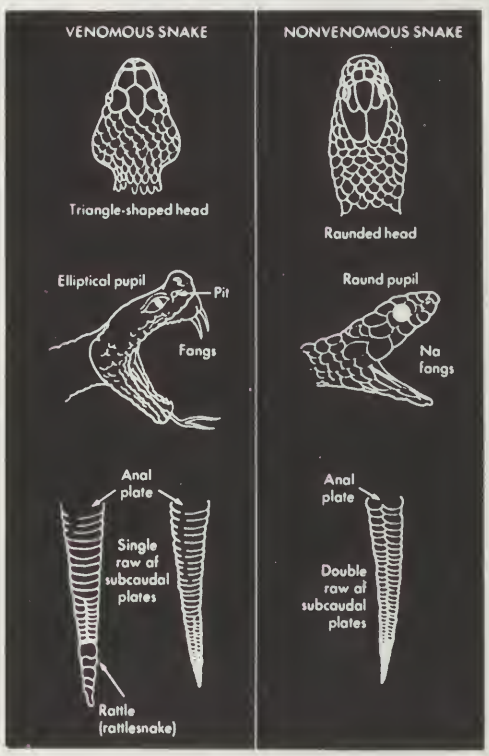

Figure 2. Comparison of venomous snakes (pit vipers) and nonvenomous snakes.

identification. Consequently, accurate diagnosis and treatment depend on objective signs and symptoms of snakebite envenomation.

Although many people believe that all bites sustained from venomous snakes invariably result in envenomation, about 25 to 30 percent of poisonous snakebites do not result in envenomation and require no further treatment.[1] This happens as a result of failure of the venom gland-fang mechanism, insufficient amount of venom injected, and/or indirect hits with the fangs that result in only scratches.[3]

Symptoms and Signs

Terror is the most common reaction to both venomous and nonvenomous snakebites. As a result of intense fear and panic, the victim may become emotionally unstable, with thoughts of imminent death, or may enter a state of extreme lethargy and withdrawal. Fear may cause symptoms such as nausea, vomiting, diarrhea, dizziness, fainting, tachycardia, and cold, clammy skin. Autonomic reactions must not be mistaken for systemic symptoms from the bite, leading to unwarranted treatment by individuals unfamiliar with snakebite management.

The cardinal signs and symptoms of pit viper envenomation are fang puncture(s), pain, edema, and erythema of the bite site and adjacent tissues (Figure 3).

The number of puncture wounds may be one, two, or more depending on the number of fangs the snake has, the accuracy of the strike, and the number of strikes inflicted. Superficial lacerations produced by fangs usually do not result in envenomation because the discharge orifice of the fang lies somewhat above the tip. Teeth marks, other then fang punctures, may or may not be present.

There is moderate to severe pain in or around the local bite site in about 90 percent of pit viper envenomation. The pain has been described as sharp and burning in character, usually developing within five minutes following inoculation of the venom.[1] If local pain or tenderness has not developed within one hour of the bite, the snake was either nonpoisonous or did not deposit venom.

Edema and erythema are characteristic of pit viper envenomation, occurring usually within 30 minutes of the bite and evolving both proximally and distally as the venom spreads. The edema may spread for 12 to 24 hours. If the occurrence of edema and erythema have not manifested within 4 hours after a snakebite, it generally is safe to assume the patient does not have pit viper envenomation.[3] Erythema results secondary to capillary congestion. Diapedesis promotes the appearance of ecchymoses and hemorrhagic blebs after several hours. The venom contains a vasculotoxin that increases capillary fragility and the appearance of petechiae. Bullae may then appear, which may be serous or hemorrhagic, indicating the severity of the envenomation.

Regional lymphadenopathy and concomitant tenderness occur even in minimal envenomation. The development of subfascial tension may augment necrosis as a result of obstruction of arterial and venous blood flow.

Severe envenomation may be accompanied by hypotension and shock occurring a half hour or more following the bite.[4] Other less frequent systemic manifestations are paresthesias about the face and lips and skeletal muscle fasciculations in the affected area, occasionally becoming generalized secondary to the neurotoxic component of some pit vipers, that is, the eastern diamondback rattlesnake.

Anemia occurs secondary to endothelial damage and hemolysis. The venom-induced intravascular clotting triggers the defibrination syndrome resulting in hematemesis, hematuria, and internal hemorrhage. Acute renal failure may result secondary to disseminated intravascular coagulation and cortical necrosis or acute tubular necrosis from shock (pooling of blood in the microcirculation). Generalized convulsions, coma, and respiratory paralysis may ensue.

Figure 3. Photograph of hand showing typical signs of edema and erythema approximately 1 hr following bite of copperhead. Left hand is shown for comparison.

Elapidae (coral snakes and cobras) envenomations differ markedly from those of pit vipers. There may be little or no pain or swelling immediately after the bite. Occasionally, there is a delay of one to five hours before the onset of systemic symptoms[5] characterized by ptosis, dysphagia, dysarthria, and intense salivation. Loss of deep tendon reflexes and respiratory depression occur later as a result of a potent neurotoxic agent.

Clinical Classification of Pit Viper Bites

A five-grade classification system (Table 1) was developed to assist physicians in determining the severity of the envenomation and to serve as a guide in treatment.[6-8] For example, the preponderance of edema seen in many cases may be the result of a tightly applied tourniquet, rather than the severity of the envenomation. On the other hand, victims seen immediately after a large bite by a rattlesnake may exhibit intense pain but show few other symptoms and signs until later.

The ultimate severity of any venomous snakebite depends on the size and species of snake; the location of the bite; the number of fang punctures; the grade of envenomation; and the age, size, and underlying medical condition of the victim. For the most part, rattlesnake and cottonmouth bites are more serious than bites inflicted by copperheads.

Epidemiology

Approximately 6,700 people in the continental United States were treated for poisonous snakebites in 1958 and 1959, when the last major survey was performed by H. M. Parrish.[1] To collect data on snakebites, all hospitals in the US were asked to report inpatients treated for poisonous snakebites. Since it was not standard practice to code and tabulate diagnoses for patients visiting emergency rooms and outpatient clinics, and since many snakebite victims were not admitted to the hospital as inpatients, Parrish also submitted his questionnaire to a random sample of practicing physicians (internists, general practitioners, surgeons, pediatricians, and orthopedists) who may have treated snakebite victims in the office, home, or emergency room. Copies of death certificates for fatal snakebites were requested from state health departments.

States having the highest bite rates per 100,000 population were North Carolina (18.79), Arkansas (17.19), Texas (14.70), Georgia (13.44), West Virginia (11.29), Mississippi (10.83), Louisiana (10.25), and Oklahoma (8.85). The majority of these victims were male, nonwhite, and under 20 years of age. Over 90 percent of the bites were inflicted on the person's extremities. Temporal studies showed that 94 percent of the bites occurred between April and October, the peak months being July and August. This coincided with the times when snakes were more prevalent and the human population more likely to participate in outdoor occupational and recreational activities.

Table 1. Grades of Envenomation: Pit Viper Bites

Grade	Degree of Envenomation	Clinical Examination and Findings
0	None	Fang marks and minimal pain, less than 1" edema
I	Minimal	Fang marks, pain, 1-5" edema and erythema in first 12 hrs
II	Moderate	Fang marks, pain, 6-12" edema and erythema in first 12 hrs; Systemic symptoms, occasionally
III	Severe	Fang marks, pain, edema and erythema over 12" in 24 hrs; systemic symptoms present, including coagulation defects
IV	Very severe	Rapid local reaction; edema of ipsilateral trunk; ecchymoses, blebs, coagulation defects

Venomous Snakes in Maryland

Poisonous snakebites remain a significant medical problem in the region of the southern Atlantic states. The last major survey in Maryland was performed as part of Parrish's mapping in 1958 and 1959. This study included questionnaires returned from 46 Maryland hospitals, supplemented by 348 practicing physicians in Maryland.[9] The adjusted physicians' reports demonstrated that approximately 18 inpatients and 24 outpatients were treated in 1958 and 1959. This yielded an incidence of 1.35 bites per 100,000 population per year.

Only two venomous snakes are indigenous to Maryland: the timber rattlesnake (*Crotalus horridus horridus*) and the northern copperhead (*Agkistrodon contortrix mokeson*) (Figure 4).

The timber rattlesnake is the second largest and most dangerous rattlesnake native to the eastern portion of the United States. Its body color varies with the phase and may be either yellow or black. The timber rattlesnake's usual habitats include mountainous and hilly terrains with surrounding rocky ledges and wooded regions. In Maryland, the timber rattlesnake is found in the western third of the state and in a small area just north of Baltimore.

The copperhead is more common in Maryland than is the timber rattlesnake, and accounts for more bites. It is sometimes referred to as the dryland moccasin or the highland moccasin. Other names have included the pilot snake, red oak snake, poplar leaf snake, and white oak snake. The average adult snake will vary in length from 24 to 36 inches.

The copperhead snake is ubiquitous to mountains, wooded hillsides, rock piles, rock quarries, and sawdust piles and is found throughout Maryland, except in the central portion of the Eastern Shore. It is not unusual for the copperhead to live within city limits and near suburban housing developments. Rodents, frogs, birds, and insects are its major food sources. When disturbed or stepped on, the copperhead can strike with lightning speed.

Snakebites in Maryland: 1988 - 1989

A detailed questionnaire and a letter explaining the purpose of a survey were prepared by Gold and Barish and mailed to 49 emergency department directors in Maryland with a request to report all inpatients and outpatients treated for poisonous snakebites in 1988 and 1989. The questionnaire sought information for both years to determine whether there were large

statistical variations in venomous snakebite cases and was followed up by telephone calls, letters, and requests for additional information.

Results

A total of 24 venomous snakebites were reported by Maryland hospitals in 1988 and 1989. Based on the 1989 Maryland census, this shows an incidence of 0.42 bites per 100,000 population in 1989. The geographical distribution of venomous snakebites occurring in Maryland in 1988 and 1989 is shown by their respective symbols in Figure 5.

Of the 24 venomous snakebites reported, nine bites were from copperheads, four from timber rattlesnakes, and eleven from unidentified poisonous snakes. The current study shows that 38 percent of poisonous snakebites in Maryland were inflicted by copperheads. The majority of unidentified snakebites occurred within the locality range for copperheads, suggesting that many of these bites were inflicted by copperheads. Two cases of timber rattlesnake bites occurred outside the ecological range for this species, but the victims were handling pet rattlesnakes.

Temporal relationships All cases of venomous snakebites were reported from May through October of 1988 and 1989. The highest number of bites were reported in July and August. This coincides with the time when snakes are more active and parallels the earlier study by Parrish (Figure 6).

Most snakebites occurred between 3 and 6 p.m. (seven people were bitten). An additional six bites occurred between 6 and 9 p.m. accounting for 54 percent of the bites.

Snakebite victims Of the 24 cases, 21 males and 3 females were treated for snakebites in 1988 and

Figure 4. Maryland's venomous snakes: the copperhead (top) and the timber rattlesnake. Photographs by Joseph McSharry.

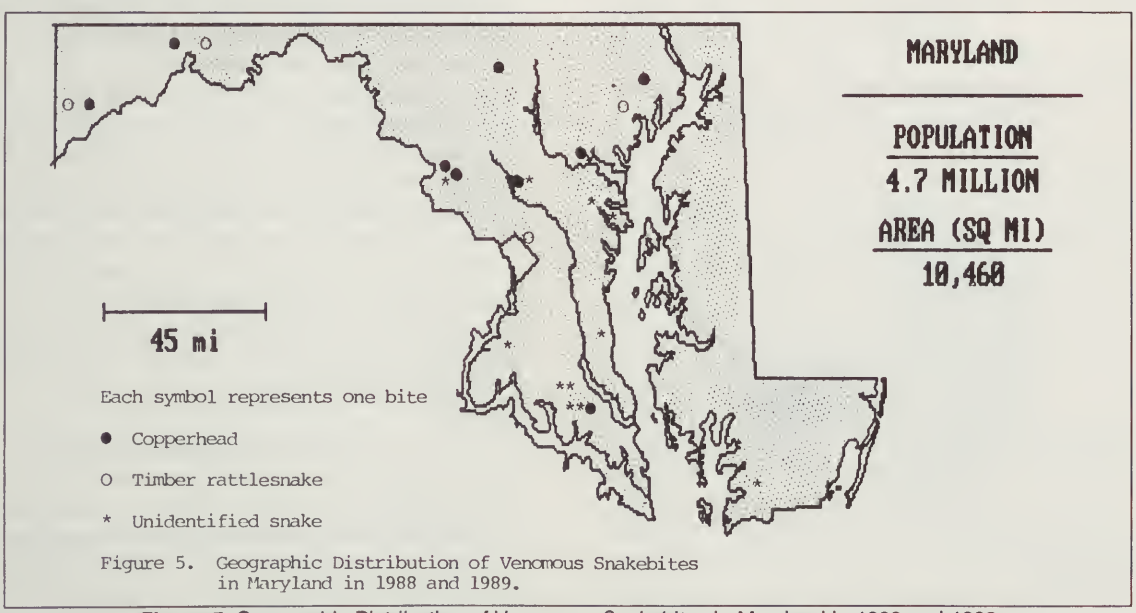

Figure 5. Geographic Distribution of Venomous Snakebites in Maryland in 1988 and 1989

1989. Of these, 21 were white and 3 were black. The black victims were all males. Seventy-two percent of the snakebite victims were between the ages of 20 to 49. These ages differ significantly from those shown in 1959 by Parrish. In that study, 64 percent of all snakebite victims were children and young adults less than 20 years old.[9]

Activity Figure 7 shows the various activities of the victims when bitten by venomous snakes.

Site and severity All the venomous snakebites reported occurred on the extremities. Approximately 70 percent of the bites occurred on the upper extremities, the remainder on the lower extremities.

The clinical classification of pit viper envenomation described in Table 1 was used to determine the severity of each snakebite. Nine cases were reported as Grade 0 and ten cases as Grade II envenomations. Three cases were reported as Grade I, and two cases were reported as Grade III. No cases of Grade IV envenomations were reported.

There were no deaths related to the venomous snakebites reported in 1988 and 1989.

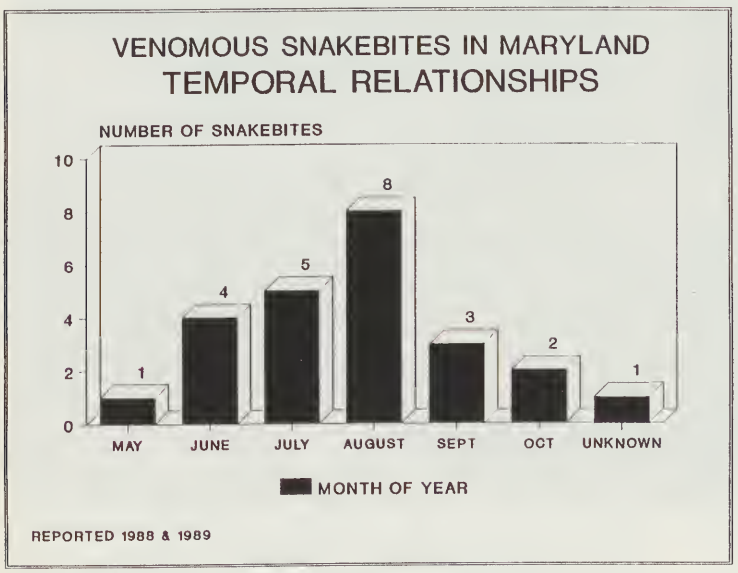

Figure 6.

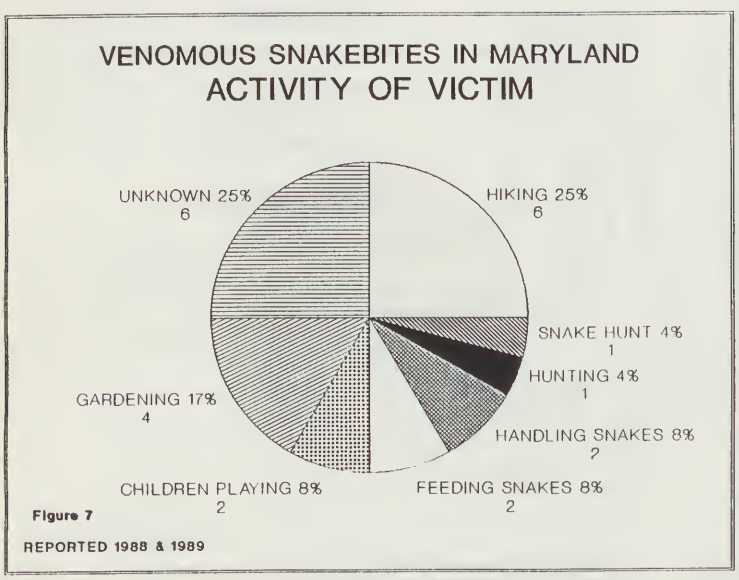

Figure 7.

Emergency Therapy in the Field

In the event of a suspected snakebite, the patient should be reassured and the area of the bite immobilized at or below the level of the heart. No stimulants (such as caffeine or alcohol) should be ingested by the victim, since they accelerate absorption of venom. We strongly recommend that the victim be transported to the nearest medical facility as soon as possible.

The standard use of tourniquets and incision and suction (I&S) as part of emergency field therapy remains controversial among many snakebite experts. We strongly discourage the use of tourniquets and I&S by lay people. This is supported by Dart who studied 94 snakebite victims at the University of Arizona. Of these, 18 patients had used tourniquets. Of these, eight developed problems: six developed tissue loss, and two had permanent disability resulting directly from the use of a tourniquet.[10] Treatment should be administered by a physician or individual skilled in snakebite management.

Many people are under the impression that snakebite victims die within several minutes to two hours following the bite. This is a fallacy for snakes indigenous to the US. It generally takes several hours after the bite before the severe toxic effects from the venom ensue. According to Parrish, of 138 people who died from snakebites in the US over a ten-year period, only 4 percent died within one hour, and only 17 percent died within six hours. The majority (64 percent) died six to forty-eight hours after the bite.[11] Victims of snakebites who receive medical attention within the first two hours following a bite have an excellent chance of survival.

The snake should be killed and the head brought for identification, if this can be done without endangering either the victim or another person. However, tt has been observed that recently killed or dying snakes are still capable of inflicting bites. We are aware of snakebites resulting from handling the severed head of a venomous snake that was killed several minutes earlier. It is therefore imperative not to handle the snake directly, but rather to use a stick to place the snake's parts in a bag or other container.

Emergency Room Therapy

A detailed history of the envenomation along with the type of field therapy (for example, tourniquet, I&S) administered should be obtained. The history should include the **time of the bite, a description of the snake, and whether it was killed**

and brought in for identification. The patient's past medical illnesses such as heart disease, diabetes mellitus, hypertension, renal disease as well as allergies such as asthma, exposure to horses, and previous administration of horse serum should be obtained.

A preliminary physical examination should include inspection of the bite site to observe for fang and/or tooth marks. One does not always find two fang puncture wounds. There occasionally may be one, two, or more present (the patient may have been bitten repeatedly by the same snake). A baseline neurological status should follow the recording of blood pressure, pulse, temperature, and respiratory rate. Using the grading classification, an attempt should be made to classify the envenomation. A circumference measurement of the bitten area should be done, repeated on an hourly basis, and documented on the chart.

A skin or eye test for hypersensitivity to horse serum should be performed by the intracutaneous injection of 0.02 cc of saline diluted serum at a site distant from the bite. The wheal site is observed for at least 10 minutes for the development of erythema, hives, pruritus, or other untoward effects. A syringe with 1:1000 epinephrine should be available for allergic reactions.

Blood should be drawn for CBC, platelets, glucose, BUN, creatinine and serum electrolytes. Additional blood should be obtained for transaminases, bilirubin, creatinine phosphokinase, prothrombin time, partial thromboplastin time, thrombin time, and fibrinogen, and typed and cross-matched. A baseline urinalysis should be obtained. These tests can be repeated at appropriate intervals. An electrocardiogram should be obtained in all patients over the age of 40.

A large-bore peripheral intravenous line for the delivery of antivenin in 5 percent dextrose/normal saline should be started. A second peripheral intravenous line employing a large-bore catheter is recommended in moderate to severe envenomations where it may be necessary to administer large volumes of fluid, plasma, blood, and other medications in the event shock ensues. We believe that if there is any doubt regarding the severity of the envenomation, the patient should be hospitalized for at least 24 hours and monitored frequently. The patient's family should be notified as soon as possible and informed of the patient's condition and possible late manifestations.

The Role of Antivenin

Antivenin remains the mainstay of venomous snakebite treatment. Antivenin (Crotalidae) is a polyvalent North and South American antisnake serum manufactured by Wyeth Laboratories by hyperimmunizing horses with multiple snake venoms. A separate antivenin is used for coral snakebites. For Grade 0 to Grade I envenomations, no antivenin is routinely administered.

Antivenin is given to those patients who have demonstrated Grades II through IV envenomation and have a negative skin test or conjunctival test. The demonstration of a negative skin or conjunctival test does not preclude the possibility of an anaphylactic reaction. For this reason, we administer 0.2-0.5 cc of antivenin slowly, intravenously, over 5 minutes. If no reaction occurs, the remainder can be infused after mixing with normal saline, 5 percent dextrose/water or Ringer's lactated solution and infused over one to two hours. We do not recommend that antivenin be given in one ampoule increments over many hours. If the anticipated severity of the envenomation would require the administration of, for example, a total of 5 ampules, it is best to administer the entire amount over a period of one to two hours.

In cases where the patient demonstrates a positive skin or conjunctival test, the risk of possible death from snake envenomation should be weighed against the risk of anaphylaxis to horse serum. The brochure that accompanies the antivenin outlines the technique for desensitizing patients with positive skin or conjunctival tests who require antivenin for moderate to severe envenomations. Those patients undergoing desensitizing or treatment with antivenin should be monitored in an intensive care unit.

Patients with severe envenomations who have had anaphylaxis from horse serum pose serious problems. In this clinical situation, the physician should seek written consultation from other physicians, along with a discussion of the options with the patient and his/her relatives. Parrish elected not to treat four patients with severe envenomations and a prior history of anaphylaxis to antivenin because he believed the risk of dying from anaphylaxis was much higher than the risk of dying from severe pit viper envenomation.[12] Parrish indicated that this was a small percentage of cases and that untreated pit viper envenomation can result in death. We believe that in the setting of today's intensive care units with state-of-the-art monitoring equipment, moderate to severe rattlesnake envenomations should be treated with antivenin.

Amount of Antivenin

Antivenin neutralizes the venom at the site of the bite before the venom and its by-products are absorbed systemically. Until the 1960s, most antivenin was given either intramuscularly or subcutaneously. Some investigators injected it directly into the area of the bite. Subsequent experimental studies have shown clearly that intravenously administered antivenin yields a more rapid, effective, and predictable response.[13-15]

Ideally, the amount of antivenin administered to patients should be based on the amount of venom inoculated and the potency of the individual snake's venom. It has been observed that the potency of the venom of an individual snake may be as much as five times greater than another snake of the same species.[16] As a result, it is impossible to provide a rule to precisely calculate the amount of antivenin to deliver.

Based on his clinical experience with snakebites, Parrish has recommended the following amounts of antivenin for treating the various grades of envenomation: for Grade 0, no antivenin; for Grade I, 10 cc of antivenin; for Grade II, 30-40 cc of antivenin; and for Grade III, 50 cc or more of antivenin.[12] According to Gennaro,

> the dose of antivenin must vary with the severity of the bite and can probably be said to be adequate when the progressive swelling of the bitten part is permanently inhibited. Two to five units may be customary and occasionally more are necessary.[15]

Wengert recommends a different approach for the treatment of envenomations: no antivenin for Grade 0; 50 cc for Grade I; 100 cc for Grade II; and 150 cc for Grade III.[17] These dosages are considered high and reflect the severity and toxicity of bites from the Mojave rattlesnake (*Crotalus scutulatus*) endemic in the West.

In our opinion, dosage should be guided by the severity and progression of edema as well as clinical and laboratory findings. In children, many experts recommend that the dose of antivenin be increased by 50 percent because of the relatively larger volume of envenomation in relationship to their total body surface area.

Antivenin should not be routinely administered in every pit viper bite. It may be unnecessary in most cases of copperhead bites, unless the envenomation is considered moderate to severe, or possibly in the case of small children.

Pregnancy is not a contraindication to the administration of antivenin. Early treatment may halt venom induced uterine contractions and abortions in cases of severe envenomation.[18]

Incision and Suction

Incision, suction, and cautery was first described by the Indian physician Sushruta in 600 BC. This treatment has remained unchanged with the exception of cautery over the last 2,500 years. For many physicians, an intermittently applied, lightly constricting tourniquet, obstructing only lymphatic and superficial venous blood flow is still considered very effective in delaying spread of venom and makes incision and suction (I&S) more effective. Parrish observed that controversy over I&S generally could be explained by differences in experimental methods, including the choice of venoms, experimental animals, methods of performing I&S, and criteria for judging the success or failure of an experiment.[3] Ya and Perry found I&S effective when performed within 30 minutes following the injection of venom in dogs.[19] Reid advises that any excess venom should be wiped off from the skin surface and a firm but not tight tourniquet should be applied; the victim should be transported to a hospital as soon as possible.[20]

Incision and suction (I&S), if performed, should be done by a medical professional. If performed improperly, there is increased risk of wound infection and possible compromise and damage to neurovascular elements. Cruciate incisions should not be made, since this violates the principles of wound healing and can accelerate necrosis of skin margins. A linear incision is made through the skin, approximately one-quarter inch long and one-eighth inch deep over the fang puncture(s). In the event of multiple fang punctures, incisions should be made over the punctures. The sooner I&S is performed, the more venom can be extracted from the bite. To be effective, I&S should be performed only within the first 30 minutes of the envenomation. If a tourniquet is in place, and no other first aid therapy is performed, I&S may be performed and continued for about one hour. Once antivenin is administered, I&S should be discontinued. In the majority of instances, at least 30 minutes or more elapse before snakebite victims are evaluated by medical personnel. Therefore, I&S should rarely be performed.

Excision and Suction

Not all venomous snakebites should be treated by excision and suction: it should be reserved for severe envenomations, such as those involving the trunk. To be effective, the area of excision should be wide. Excision and suction, like I&S, should be performed within 30 minutes.[21]

Fasciotomy

An intense debate revolves around the use of surgical fasciotomy for decompression of severe envenomations associated with elevated compartment pressures. The compartment syndrome can be viewed as an acute toxin-associated myositis/cellulitis that may progress independently of the compartmental pressures. Garfin found that there was no surgical difference with fasciotomy and recommended medical management.[22] Many authorities are becoming more conservative with the use of a fasciotomy as initial treatment of envenomation. We believe that medical management with antivenin should be the initial therapy in all severe envenomations.

Cryotherapy

The proponents of cryotherapy believe cold (ice packs or ice water) applied to the site of the bite is useful in the reduction of pain, absorption of venom, and prevention of widespread scarring produced by other techniques. Most experts on snakebite treatment agree there is no experimental evidence to support this method of therapy. This has been stated by the American Red Cross, the National Academy of Sciences, National Research Council on Envenomation, as well as the American College of Surgeons Committee on Trauma. In fact, this treatment often causes more damage to the affected area than the venom itself. This is secondary to frostbite from vasoconstriction.

Moreover, the vasoconstriction in the cooled, damaged region does not allow the antivenin to penetrate and neutralize the effects of the venom. When the cooling is discontinued, a "rebound phenomenon" is observed, where the venom and its by-products are released into the body. This could actually lead to a recrudescence of the envenomation, including shock.[2] In an analysis of 36 cases of amputation after snakebite, McCollough and Gennaro noted that cryotherapy had been used in 27 cases (75 percent).[8] We are of the opinion that cryotherapy has no place in the treatment of snakebite envenomation.

Tetanus Immunization

Patients who have not received immunization from tetanus, should be given tetanus immune globulin and tetanus toxoid. For patients who have been immunized but who have not received a booster shot within the previous five years, a booster is recommended.

Antibiotics

Most authorities agree that antibiotics are indicated in the majority of cases. The exception is for superficial scratches that can be locally treated with antiseptics. Ledbetter and Kutscher do not use prophylaxis on all snakebite victims with broad-spectrum antibiotics because the bacteria on fangs and in venom is varied, and they believe no single antibiotic is effective against the majority of gram negative organisms.[23] On the other hand, Parrish studied the bacterial flora of snakes' mouths and venom glands. The most commonly found organisms were gram negative and gram positive rods. *Proteus vulgaris*, *Escherichia coli*, and *Corynebacterium diphtheroids*-sp were cultured.[24]

We recommend the use of a broad-spectrum antibiotic that provides appropriate gram negative coverage for the treatment of moderate to severe envenomations.

Complications of Treatment

The most frequently recognized complication of venomous snakebite treatment is serum sickness that occurs approximately 7 to 14 days following the administration of antivenin. In general, the probability of serum sickness increases with the administration of doses of antivenin exceeding five vials. It generally manifests in fever, rash, arthralgias, and lymphadenopathy. Rarely, a peripheral neuritis, pericarditis, or encephalitis may be observed. Patients respond very well to a tapering course of prednisone, generally starting at 60 mg/day and tapered over the next 7 to 10 days.

A rare complication is the development of anaphylaxis from sensitivity to the antivenin. This generally occurs within the first 30 minutes following its administration. As mentioned previously, it is treated with IV epinephrine, diphenhydramine, and hydrocortisone or its derivatives.

Injuries resulting from first-aid treatment using a tourniquet either applied too tightly or left in place too long have resulted in necrosis and amputation of a limb. A tightly applied tourniquet may augment the presence of edema, which could alter the interpretation of the severity of the envenomation. Cryotherapy treatment usually is attended by extensive tissue necrosis and frequently results in subsequent amputations.

Snakebite Prevention

While outdoors, one should avoid snake-infested areas (such as caves, rock crevices and dens) and take adequate precautions when stepping, sitting, or lying on unknown terrain. Boots, gloves, trousers, and long-sleeved shirts should be worn for protection. One should never attempt to awaken, alarm, or molest a snake if one or several are encountered. If one is horseback riding and dismounted, the horse should be kept close by. Venomous snakes never should be kept as pets.

Reporting of Poisonous Snakebites

Although there are laws governing the reporting of communicable diseases, physicians and hospitals are not required by law to report venomous snakebites in the majority of states. It is our belief that the incidence of venomous snakebites is highly underreported. Only a federal mandate to report snakebites will provide the impetus for states to treat snake envenomations as reportable diseases.

LifePlus Introduces Exotic Flavors

Move over chocolate, vanilla & strawberry. LifePlus has introduced **PINA COLADA** and **ORANGE SHERBET** flavored shakes to its physician-supervised weight control program – a program that combines a modified fast with behavior modification, nutritional counseling and exercise.

"We've eliminated the boredom of the typical modified fast. People crave variety. That's why we were first to introduce creamy chicken soup, and now we have exotic flavors. Just in time for the summer, these new flavors will help patients feel that they're not missing out on summer fun just because they're on a diet," says Cleo Bennett Kelly, president of LifePlus.

The shakes and soups, which are available in two high protein formulations, are low in fats, carbohydrates and cholesterol, yet high in protein and essential amino acids. LifePlus is only available through physicians. For information or samples, call LifePlus.

Commitment and Service Since 1975

The *Med Chi Agency* was established by the Medical and Chirurgical Faculty in 1975 and now has over 5,000 physicians and employees as clients.

As a comprehensive insurance agency, we are able to offer a wide range of insurance and financial products. You will benefit from the many coverages available for both your professional and personal needs. You will also benefit indirectly, because Med Chi owns the *Med Chi Agency* and the earnings from its operations.

For complete information about any insurance product or service, just give us a call. We can provide the answers you seek and the solutions you need.

The Johns Hopkins University School of Medicine
Department of Emergency Medicine

presents

Third Annual
Written Boards in Emergency Medicine:
A Comprehensive Review

October 27 - November 2, 1990

Baltimore, Maryland

This seven day program is designed to provide a **comprehensive review** of the fund of knowledge necessary to **enable successful completion of the certification examinations** offered by the American Board of Emergency Medicine (ABEM). The official complete schedule of examination dates is available from the ABEM. Candidates for whom this course may be most helpful are those scheduled for: written recertification examination on November 4, 1990, written initial certifying examination on November 5, 1990, or the oral initial certifying examination on January 27-30, 1991. This course is recommended for both the established physician-in-practice and the physician who has recently completed residency training. It is anticipated that course participants will be near completion of a self-directed plan of study. Some written board candidates have chosen to begin their plan of study a year in advance by taking this course, others appreciate a **structured** and **systematic review** just **days prior to the written certifying exam.**

Our **curriculum** is designed based primarily on the "core content" in Emergency Medicine which was developed jointly by the American Board of Emergency Medicine and the American College of Emergency Physicians. **Allocation of lecture time** for specific areas has been determined by the relative weight of content areas as delineated by the ABEM for examination purposes. The program **objectives** are to enable registrants to: review and reinforce the **organization and comprehension of the essentials** of the core curriculum in Emergency Medicine, **refine test taking skills,** gain the psychological edge to be at your 'peak performance' on the examination day, and enhance your clinical skills for improved patient care.

The response to our course offering in the past has been most gratifying. **We** have **listened to** the **feedback** provided by prior registrants and course faculty, and this led to several new features. This year we will include a formal didactic session on preparation for the oral exam. Additionally, **elective** opportunity for private **oral board preparatory tutorials** and **small group oral board simulation** will be available during the program. The underlying philosophy of our program is unchanged and our primary focus will remain the written board exam candidate. There are many resources from which to learn the information suggested by the core content curriculum. Among them are Rosen's Textbook of Emergency Medicine, the ATLS/ACLS manuals and numerous other texts, monographs and journals. This year we have chosen to present the core content information in a format that correlates organizationally with the text, Emergency Medicine: A Comprehensive Study Guide - American College of Emergency Physicians, edited by Tintinalli, Krome and Ruiz. Finally, we have added a three component special session which will provide practical suggestions and strategies on **how to achieve optimal performance on your examination day.**

A variety of **instructional formats** are utilized which will allow each registrant to gain the most from this program. **Formal lectures**, a comprehensive **'syllabook'** (which is mailed to you in advance), a total of over 1000 single answer multiple choice **"pretests questions"** for self assessment purposes administered prior to each half day lecture session, **self teaching laboratory** which is open 14 hours daily, **faculty panel** question/answer **discussions** following each half day session, **x-ray view box displays, PEER IV review sessions,** and **elective oral board practice/tutorial sessions** will be available for enhancement of your preparation.

The **teaching faculty** consists exclusively of emergency medicine physicians who have taken the written board and are noted for their interest and expertise in teaching. We are fortunate to have retained almost all of the best received 1989 faculty and several outstanding additional faculty members from community practices, academic institutions throughout the country and the Johns Hopkins Medical Institutions.

Registration will be limited. Plan now to join us in the fall.

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

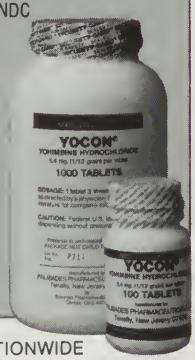
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatric. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

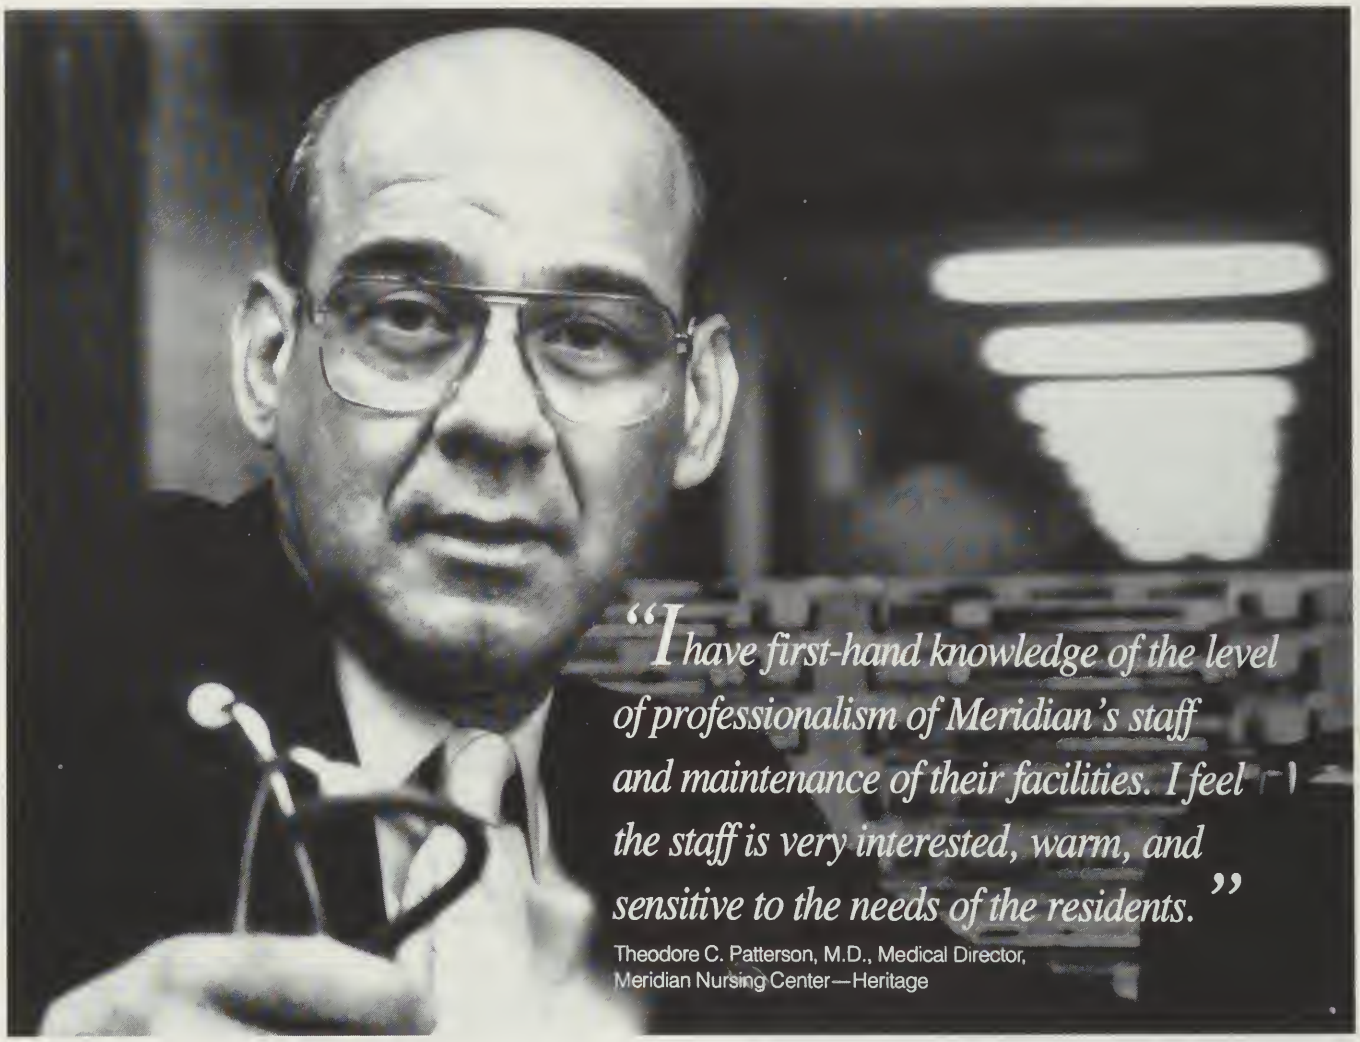
MERCY MEDICAL CENTER BALTIMORE, MARYLAND

Announces a Program in Phacoemulsification

Course Director: Leeds E. Katzen, M.D., F.A.C.S.
Chief, Department of Ophthalmology
Coordinator: Kathleen Molyneaux, R.N.

This intensive two-day program is designed for the surgeon who actively intends to begin performing these techniques and may or may not have had prior problems. The objective of this program is to provide the participant with the full range of knowledge and support necessary to be successful with the most current techniques of Phacoemulsification.

The Program Will Include:



- Indications and contraindications for Phacoemulsification.
- Intensive lectures with audio visual aids, by full-time and guest faculty.
- Preoperative preparation and postoperative care.
- Routine practical instruction in laboratory on surgical technique and use of the Phaco-Emulsifier.
- Capsularhexis and Hydrodisection.
- One-handed and two-handed techniques taught.
- Management of complications.
- Concentrated time for question and answers and discussion with the full time and guest faculty.

Course Dates:
October 12-13, 1990
November 16-17, 1990
1991 Dates to be Announced

Guest Faculty
To Be Announced
Tuition: $495.00
10 Hours Category 1 CME Credit

For Additional Information, contact:
Kathleen Molyneaux, R.N. • Mercy Medical Center
301 St. Paul Place • Baltimore, MD 21202 • (301) 783-5878

As an organization accredited for continuing medical education, the Mercy Hospital Center designates this continuing medical activity as meeting the criteria for 10 credit hours in Category 1 of the Physician's Recognition Award fof the American Medical Association.

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

Near-drowning Accidents Among Children

Mary H. Wagner MD

Dr. Wagner is an Assistant Professor of Eudowood Division of Pediatric Respiratory Sciences, The Johns Hopkins Hospital, Baltimore.

Water-related activities are a source of family fun and exercise, but everyone needs to be aware of the potential hazard of drowning and near-drowning.

During the long, hot, and humid months of June through September children enjoy water-based recreation in Maryland. At this time of year, the risk of drowning and near-drowning also increases.

Drowning is death by suffocation after immersion/submersion in liquid, while near-drowning is survival, if only temporarily, after suffocation by immersion in liquid.[1] Secondary drowning refers to death 24 hours after initial submersion due to complications of initial injury despite apparent successful resuscitation.

Epidemiology

Drowning is the second leading cause of accidental death among children less than 14 years old (Table 1). It ranks third as a cause of all deaths (after motor vehicle accidents and cancer) in this age group.[2]

The danger of drowning peaks in two particular age groups - teenage boys and toddlers. Teenage boys are at peril due to risk-taking behavior in water-related activities including swimming, diving, and boating. Their increased risk is related to sociocultural behavior patterns as well as drug and/or alcohol exposure.

Toddlers are at a particular risk for drowning and near-drowning accidents due to their curious nature and inability to physically extricate themselves from a pool or bucket and are especially vulnerable to household accidents involving bathtubs, toilets, and washing machines.[2,3]

Forty percent of drowning victims in the United States are less than 4 years old.[4] Most of these drownings take place in swimming pools or natural bodies of water, and most of these accidents are related to inadequate supervision of naturally curious children.

Boys are more often drowning victims in both toddler and teenage groups. There are many more teenage boys involved in drowning accidents than girls of similar age.

Another at-risk group includes children with a seizure disorder. The risk in this group is thought to be four to five times that of other children and is increased among those with poor seizure control, by changes in medications, or by mental impairment.[5]

Table 1. Accidental Deaths in Children Through Age 14, Maryland 1986 and 1987

	Motor Vehicle	Drowning/Submersion
Under 1 year		
1986	3	2
1987	2	4
1 - 4 years		
1986	12	10
1987	8	4
5 - 14 years		
1986	33	7
1987	37	6

Pathophysiology

Asphyxia with hypoxemia due to pulmonary impairment is the common denominator leading to morbidity and mortality with drowning/near-drowning accidents. Thus, the duration of hypoxemia is the most important determinant of outcome.[4]

There are theoretical differences in the pathophysiology of salt and fresh water drowning due to differences in fluid composition. Ninety-eight percent of drownings occur in fresh water.[4] Hypotonic fresh water would be expected to move through alveoli into intravascular space to cause dilutional effects (hyponatremia, hypervolemia). Hypertonic salt water would be expected to withdraw fluid into alveoli and this to result in hypernatremia. However, both salt and fresh water damage the normal surfactant lining of alveoli and damage basement membranes allowing intra-alveolar fluid collection or pulmonary edema. This causes atelectasis, poor pulmonary compliance, and impaired gas exchange leading to hypoxemia with right to left intrapulmonary shunting (Table 2).

The electrolyte and fluid shifts, seen in near-drowning or drowning victims, usually are not of clinical significance as the body compensates for such changes.

Stages of drowning With unexpected submersion, victims initially aspirate a small amount of liquid, causing laryngospasm lasting about two or three minutes. With hypoxia and panic, the victim begins swallowing water. In most victims persistent hypoxia causes relaxation of laryngospasm and pulmonary aspiration of fluid. However, in 10 to 15 percent of victims, laryngospasm recurs with repeated aspiration of fluid leading to a "dry drowning." After three to six minutes, circulation is impaired. Central nervous system damage is apparent by six to nine minutes.[4] The onset of hypoxic damage depends on a number of factors including oxygen consumption, water temperature, and age. With continued asphyxia, the hypoxic changes are irreversible and affect many organ systems, the brain in particular. The heart is less vulnerable to ischemia, taking much longer than the brain to sustain permanent damage.[4] Thus, a victim with irreversible brain damage may have cardiac function.

Table 2. Pulmonary Pathophysiology

Surfactant impairment
+
Intra-alveolar fluid
↓
Atelectasis

Ventilation/perfusion mismatch
↓
Hypoxemia

Ineffective ventilation
Increased work of breathing
↓
Respiratory failure

Pulmonary pathophysiology Pulmonary changes seen include pulmonary edema and alveolar inflammation. These changes also are present in so-called "dry drowning" due to hypoxemia and impaired circulation.[4] Additional damage can occur if gastric contents or contaminated fluid are aspirated.

Aspirated material can lead to bronchoconstriction, while hypoxia can worsen pulmonary capillary leak due to pulmonary hypertension. Pulmonary edema, decreased effective surfactant, and bronchoconstriction increase the work of breathing, impair effective ventilation, and eventually lead to respiratory failure.

Other organ involvement Damage to other organ systems may result from anoxia including anoxic encephalopathy, cardiac irritability with arrhythmias (especially in hypothermic situations), and acute tubular necrosis.

Treatment

By definition, "drowning" results in death, thus the focus of medical care is on the treatment of near-drowning victims. The most important aspect of treating a near-drowning victim is the institution of effective resuscitation at the earliest possible moment. This means starting mouth-to-mouth breathing as soon as the victim is brought to the surface. Take care to clear the mouth of any debris or vomitus that may be obstructing the airway. Begin mouth-to-mouth immediately after checking the airway and while applying slight cricoid pressure to decrease vomiting risk from gastric insufflation. Keep the neck stable in the event of a neck injury.

Do not waste time trying to remove fluid from the lungs. Such maneuvers are usually ineffective as the fluid will be absorbed through the alveoli quickly and vomiting may result in a further risk of aspiration. Cardiac compressions will not be effective while the patient is in the water and should be approached cautiously in the hypothermic individual due to cardiac instability.

When rescue help is available, resuscitation should be continued with a high FIO_2 to maximize oxygena-

tion. Patients who respond with spontaneous respirations with apparent recovery still should be transported to the local hospital for further evaluation and treatment. Minimal evaluation for those apparently recovered near-drowning victims should include chest x-ray, arterial blood gas or pulse oximetry.

Any patient with resuscitation requirements, loss of consciousness, cyanosis, apnea, or submersion longer than one minute should be observed in the hospital for at least 12 to 24 hours (Table 3).[2,4] Some victims without symptoms and with normal chest x-ray evaluation in the emergency department have developed respiratory symptoms as long as 12 hours after a near-drowning episode. The etiology of this delayed reaction may be due to hypoxia, aspiration, or impaired surfactant function. Late onset neurological deterioration related to cerebral edema also has been described. Thus, those victims who appear well on initial hospital evaluation warrant continued observation for 24 hours if they meet the previously described criteria.

Victims who have respiratory symptoms, abnormal chest x-ray, and an oxygen requirement will need more intensive monitoring and treatment. Patients who are apneic, require FIO_2 of greater than 0.5 to maintain a $PaO_2 \geq 90$, have pulmonary edema or hypercarbia should be considered for positive pressure ventilation. Spontaneously breathing cooperative victims may do well with mask continous positive airway pressure (CPAP), otherwise intubation with positive pressure ventilation should be instituted. Oxygen saturation should be maintained at > 90 percent while attempting to minimize FIO_2 and barotrauma. Hyperventilation aiming at a $PaCO_2$ of 25 to 30 may be helpful in cerebral resuscitation. These patients should be monitored carefully with an arterial line, continuous saturation monitoring, and consideration of pulmonary artery catheter. Prophylaxis of pulmonary aspiration or infection with corticosteroids or antibiotics has not been shown to be beneficial.[2] Bronchospasm may be encountered and should be treated with beta agonists.

Victims should be examined carefully for concomitant injuries and a history taken for chronic medical conditions. Other management should be directed at accompanying problems. If the patient is hypothermic (core temperature $< 30°$ C), he/she should be actively rewarmed using warmed blankets, warmed IV fluids and heated humidified oxygen. Intravenous access must be established, but fluids should be kept at 2/3 to 3/4 maintenance after circulatory stability is maintained to avoid fluid overload. A nasogastric tube should be placed to decompress the stomach and minimize the risk of gastric aspiration. Metabolic acidosis should be corrected with sodium bicarbonate after effective ventilation has been established. Fluid output should be monitored, and the victim examined carefully for evidence of trauma. Teenage victims should be examined closely for signs of trauma due to the frequency of near-drowning associated with boating or diving accidents in this age group .

Patients with signs of cerebral anoxia will require the most intensive monitoring and intervention. Their neurologic status should be monitored carefully with serial evaluations using an established tool such as the Glasgow Coma Score.[2] Cerebral resuscitation may require hyperventilation, fluid restriction, osmotic diuresis, elevation of the head of the bed, and seizure control.

A CT scan should be considered to rule out intracranial trauma. Although there is a known correlation between eventual outcome and intracranial pressure, there is no evidence that control of intracranial pressure influences outcome.[3,4] Previous management strategies of barbiturate coma and controlled hypothermia to control intracranial pressure have shown limited evidence of efficacy with significant associated risks and thus are controversial.

The management of near-drowning victims can be quite complex and require invasive monitoring. Patients with respiratory and/or central nervous system impairment from a submersion accident should be stabilized and transferred to an appropriate tertiary care center with *pediatric* intensive care expertise.

All near-drowning victims should be examined for associated problems such as neck injury, evidence of seizure activity, other trauma, intoxication, and child abuse. In cases involving young children, their supervision should be reviewed with consideration of investigation for possible child neglect or abuse. A careful account of the episode should be obtained from an eye-witness if possible. Important information includes a description of the incident leading to the episode, the length of submersion, the type of fluid involved, the time until resuscitation was initiated and response to resuscitation measures.

Table 3. Criteria for Observation of Near-Drowned Victims

Resuscitation measures
Loss of consciousness
Cyanosis
Apnea
Submersion for one minute or longer

Prevention

The most effective treatment of submersion incidents is prevention. This becomes more important with ever-increasing number of private pools and spas in this country.[6] Prevention includes improved education, observation, pool barriers, appropriate precautions, and teaching children how to swim.

Observation is often a key factor in drowning episodes.[7] Parents and caregivers must be reminded that toddlers need constant supervision around pools and other household water hazards. Even toddlers who have had swimming instruction may not be able to escape if they fall headfirst into a bucket.

Parents of infants who have received swimming les-

sons should not be overly reassured about their child's ability to avoid drowning.[3,7] Infants and toddlers cannot be made aware of the principles of water safety or how to respond in an emergency.

Teenagers need supervision and education about the dangers associated with boating, diving, and swimming as well as avoidance of mixing these activities with drug or alcohol use. Parents, caregivers, and lifeguards should be trained in cardiopulmonary resuscitation. Children with seizure disorders also warrant careful observation with both swimming and bathing activities. Swimmers should be cautioned not to hyperventilate to prolong underwater time as this may lead to loss of consciousness from hypoxia before increased CO_2 causes dyspnea.[8]

Precautions include outfitting all children and adults with life jackets during boating excursions. Pool and spa barriers should be at least 4.5 ft tall and locked; the pool should be inaccessible from the house. Several groups have estimated that appropriate pool barriers would reduce pediatric drowning incidents by 60 to 80 percent.[6] Communities should be encouraged to require appropriate barriers for private as well as public pools and spas.

Water-related activities are a source of family fun and exercise. However, everyone should be aware of the potential hazard of drowning and near-drowning in adults as well as children. Appropriate instruction needs to be provided to patients and families on how to avoid tragic episodes. Physicians play a key role in providing information to families about appropriate supervision practices, provision of precautionary measure such as life jackets, importance of the knowledge of CPR, and the necessity of adequate pool barriers. Pediatricians also should be aware of the correct initial management of near-drowning victims whether they appear to have recovered from the episode or to require further intensive monitoring.

Sunlight, Ultraviolet Radiation, and the Skin Excerpts: NIH Consensus Statement

Sunlight, the ultimate source of energy, is vitally important to life, but there is overwhelming evidence that exposure to natural or artificial ultraviolet radiation (UVR) has the potential for causing acute and chronic adverse effects on the skin.

Expanded knowledge about the hazards of UVR has been accompanied by improved approaches to photoprotection and preliminary evidence that suggests it may be possible to inhibit or reverse certain chronic effects of sun exposure.

Considerable controversy remains concerning the specific adverse effects caused by various wavelengths of UVR (primarily the UVA and UVB wavelengths), the magnitude of the adverse effects, and potential strategies for their prevention and/or treatment. In an effort to define the specific interactions of sunlight, UVR, and the skin and to identify methods to prevent and/or treat the adverse effects of UVR, the National Institutes of Health held a Consensus Development Conference on Sunlight, Ultraviolet Radiation, and the Skin in 1989. These are the panel's findings:

The average American's exposure to UVR has increased considerably due to changing lifestyles: more outdoor recreational activities, more emphasis on tanning, scantier clothing, and a population shift to the Sun Belt. In addition, the tanning parlor industry is growing rapidly in the United States; more than one million Americans use commercial tanning facilities every day. Adolescents and young adults, especially women, are the biggest users of tanning parlors. Increased UVR exposure in the future also may result from depletion of stratospheric ozone by manmade chlorofluorocarbons. Experts predict that for every 1 percent change in ozone, there will be a compounded 2 percent increase in UVB levels at the Earth's surface.

UVR exposure causes alterations in all layers of the skin, except perhaps the subcutaneous tissue. Any sunburn or suntan is visible evidence of injury to the skin. The long-term consequences of UVR exposure include the development of skin cancers and premature aging of the skin. In addition, the skin is a major site of immunologic activity, and UVR is capable of affecting the immune system. The only known beneficial effect of exposure to UVR is enhanced production of vitamin D in the skin.

Some exposure to UVR is virtually unavoidable over a person's lifetime. Factors contributing to the amount of exposure one receives depend on climate, geography, occupation, and recreational activities. Other factors that influence susceptibility to UVR include genetic abnormalities, skin type, acquired conditions, certain medications, and chemical exposures in consumer products and industry. The amount of protection afforded by

melanin is unclear, and individuals with dark complexions still are susceptible to UVR-induced photodamage.

UVR exposure is the most common cause of skin cancer. There are a number of preventive steps people can take to reduce the risks of UVR damage. Clothing made of tightly woven fabrics with long sleeves and long pants will provide some protection against UVR. Maximum protection can be obtained by using sunscreens with a sun protection factor of at least 15. Combination sunscreens effective against UVB and UVA are preferable. Daily use is recommended during appropriate times throughout the year.

Half of an individual's lifetime exposure to UVR occurs by the age of 18. To minimize exposure, modified schedules for outdoor activities at schools, camps, day care centers, and beaches should be considered whenever possible. The time of day and year have a major impact on the extent of UVR exposure. If exposure during peak times (between 10 a.m. and 3 p.m.) could be minimized, significant reduction in the number of nonmelanoma skin cancers would certainly follow.

There is a need to better educate persons who use tanning parlors about the hazards of artificial sources of UVR. To protect the public against injury from unintentional UVR exposure, better regulation of these tanning facilities is required.

Recent attention has focused on compounds such as all trans retinoic acid (Retin-A), which has been reported to diminish or remove wrinkles. At this time, there is insufficient evidence regarding any long-term positive or negative effects to recommend the use of Retin-A or similar compounds to treat or reverse the effects of sun-damaged skin.

A number of areas for additional research were identified. The panel urged development of more current data on the incidence of nonmelanoma skin cancers. They also cited a need for more research on the differences between chronological aging and sun-induced aging and to better define the immunologic effects of UVR on the skin. Other directions for future research include: studies to define the action spectra of sunlight and UVR in the pathogenesis of melanoma; development of better animal models to study melanoma; investigation of the biological effects of UVA radiation; additional studies on the importance of UVB radiation in vitamin D homeostasis; new approaches to diminish the risk of sun exposure during childhood and adolescence, such as behavior modification and education; development of more effective sunscreens; monitoring the risk/benefit ratio of widespread, long-term sunscreen use; and more research in the age-related optical properties of skin and acute and chronic responses to UVR. ■

Free, single copies of the complete NIH Consensus Statement on Sunlight, Ultraviolet Radiation, and the Skin *may be obtained from the Office of Medical Applications of Research, National Institutes of Health, Building 1, Room 260, 9000 Rockville Pike, Bethesda, MD 20892.*

Case Report: Thoracic Spine Schwannoma: The Role of Gd-DTPA Enhanced MRI

James S. Lim MD, Henry Wang MD, John Griffin MD, and Donlin M. Long MD, PhD

Drs. Lim and Wang are from the Neuroradiological Division of the Russell H. Morgan Department of Radiology and Radiological Sciences, Dr. Griffin is from the Department of Neurology, and Dr. Long is from the Department of Neurosurgery of the Johns Hopkins Medical Institutions, Baltimore. **Reprint:** *Henry Wang MD, Department of Radiology, Johns Hopkins Hospital, 600 N. Wolfe St., Baltimore, MD 21205.*

With the advent of MRI, spinal lesions can now be evaluated noninvasively. Knowing the location of the spinal lesion, its morphology and signal characteristics can narrow the differential diagnosis.

Magnetic resonance imaging (MRI) allows spinal lesions to be evaluated noninvasively. Knowing the location of the spinal lesion (intramedullary, intradural extramedullary, extradural), its morphology and signal characteristics can narrow the differential diagnosis. With the availability of intravenous contrast (gadolinium diethylene triamine pentaacetic acid, Gd-DTPA), MRIs sensitivity and specificity are further improved and lesions better defined. We report a case of thoracic schwannoma where Gd-DTPA was important in arriving at the proper diagnosis.

Case Report

The patient was a 37-year-old man with a two-year history of paresthesias of his hands and feet and right lower extremity weakness. He also had Castleman's disease with resection of a retroperitoneal mass and right sympathectomy about three and a half years ago. Neurologic workup (including brain stem evoked potential, visual evoked potential, nerve conduction studies, cervical spine MRI) and lumbar spine CT and MRI were normal. Laboratory tests were normal except for increased protein in the CSF.

One month prior to admission, the patient had experienced decreased lower extremity sensation, urinary hesitancy, and bowel urgency.

An MRI of the thoracic spine showed an intradural extramedullary mass at T-8, which was isointense with CSF on T-1W, inhomogeneously isointense with CSF on T-2W (Figures 1a and 1b), and intensely enhancing after Gd-DTPA intravenous injection (Figures 2a and 2b). During surgery, a large mass was seen attached to three posterior roots. Pathologic examination revealed a firm, fleshy, gray/white mass identified as schwannoma. The patient's urinary hesitancy resolved.

Figure 1a. Sagittal T-1WI (TR = 600ms; TE = 20ms) shows a hypointense (to spinal cord) extramedullary lesion dorsal to the spinal cord at T-8.

Figure 1b. Sagittal T-2WI (TR = 2000ms; TE = 100ms) shows a hyperintense extramedullary lesion partially obscured by the surrounding CSF.

Discussion

Neurinoma, schwannoma, neurilemmoma, neurofibroma, and perineural fibroblastoma are nerve sheath tumors that may be related to the Schwann cell.[1] Under light microscopy, two tumor types are distinguished: neurinoma or schwannoma, and neurofibroma associated with von Recklinghausen's disease. Schwannoma can occur in intracranial and spinal nerve roots, peripheral nerves, and nerve endings. This tumor accounts for 25 to 29 percent of spinal tumors with slight predilection for the lumbar spine.[2]

Prior to MRI, myelography, with or without CT scans, was required for imaging of spinal lesions. Its soft tissue sensitivity and multiplanar capability allows the MRI to identify and distinguish most spinal lesions.[3,4] Signal characteristics of intramedullary lesions are nonspecific, but intradural/extramedullary lesions often have signal characteristics that vary with specific histology.

Schwannomas generally are isointense with CSF on both T-1W and T-2W, making them sometimes difficult to define within the CSF. Meningiomas are isointense with spinal cord on both sequences and more easily defined.[4]

Because of schwannoma's instrinsic signal charac-

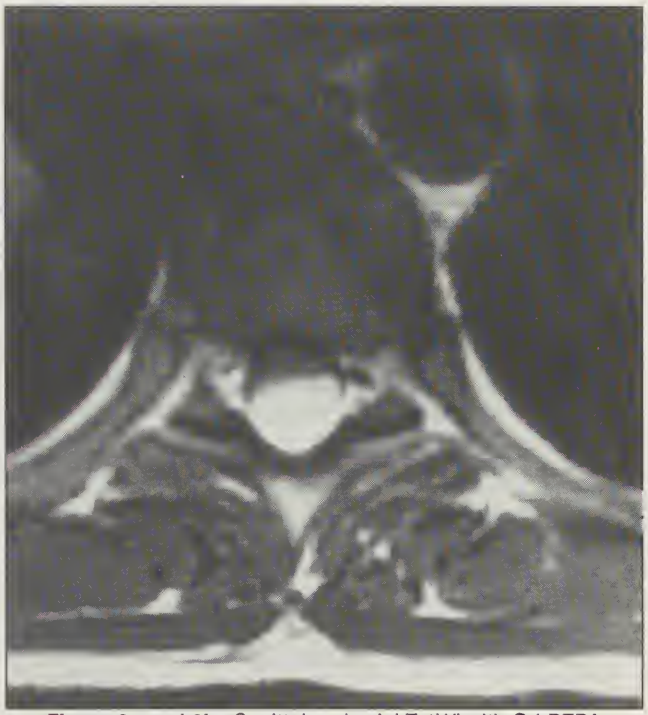

Figure 2a and 2b. Sagittal and axial T-1WI with Gd-DTPA enhancement (TR = 600ms; TE = 20ms) show a homogeneously, hyperintense extramedullary and intradural lesion.

teristics, we found Gd-DTPA-enhanced MRI to be quite helpful in defining this extramedullary lesion and suggesting its nature. In this case, the homogeneous enhancement indicates a solid tumor and not an arachnoid cyst.

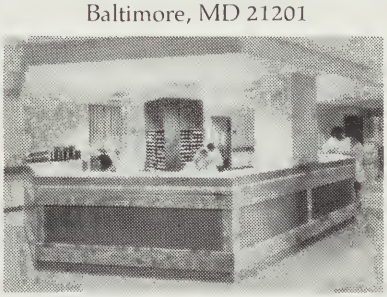
MARYLAND GENERAL PROFESSIONAL CENTER

UPSCALE ENVIRONMENT. DOWNTOWN ACCESSIBILITY.

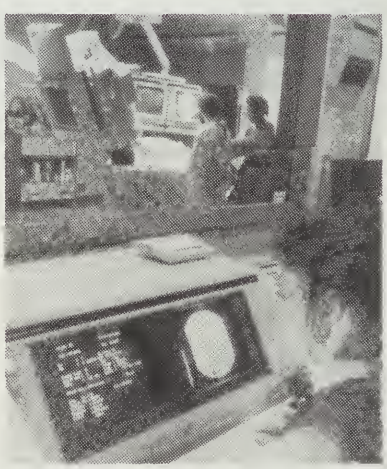
In response to the needs of medical professionals, we've built the Maryland General Professional Center. Reserved solely for the practice of medicine and related services, the center provides a professional atmosphere in a new, beautifully designed location for your practice.

- Central location is easily accessed by major traffic arteries from every direction, is served by the subway station at the State Office Complex, and is conveniently located adjacent to the planned light rail system.
- Conveniently located adjacent to Maryland General Hospital, within walking distance of hospitalized patients and specialized hospital services. Proximity improves coordination of care among patient, physicians and hospital.
- Reduced travel time between hospital and office for both physicians and patients.
- Features include a patient dropoff at the main entrance, 2 elevators (1 sized to accommodate stretchers), sound-conditioned walls, thermostatic controls for each suite, and handicap access.
- Condominium arrangement offers office ownership benefits with low equity requirement. Also available are lease/purchase or leasing options.
- Ample parking available in the enclosed 317-space garage adjacent to the building.
- Located near Meyerhoff Symphony Hall, Lyric Opera House and Center Stage.

For more information, a brochure and a personal tour, call
ROBERT HAUSSMANN,
Vice President for Corporate Development
(301) 225-8390.



The MRI Center offers physicians state-of-the-art diagnostic services with 24 hour report turn around and a voice retrieval system for instant access to dictated MRI reports from any telephone.



Maryland General Hospital is a 243-bed acute care facility serving the Baltimore metropolitan community for 108 years. Maryland General offers a comprehensive range of patient care services. We pride ourselves in the excellent quality in patient care and support services. Qualified professionals are dedicated to assisting the patient and family members during treatment and recovery. We provide this clinical support through the staff and services of many departments.

MGH

Maryland General Hospital
827 Linden Avenue
Baltimore, MD 21201

Newly renovated nursing station on a medical-surgical floor.

The Special Procedures Laboratory, dedicated exclusively to angiography, was designed in response to the needs of physicians to obtain superior diagnostic data in a timely manner.

Centralized Credentialing: State-of-the-Art Confidential Clearinghouse

Joseph E. Jensen

The author is Acting Director, Healthcare Credentials Verification, Inc., a joint project of the Medical and Chirurgical Faculty of Maryland and the Maryland Hospital Association.

In Maryland, a single organization serves as a clearinghouse for gathering and making available to hospitals those documents needed to verify a physician's credentials.

The average Maryland physician has privileges at four hospitals. That means most doctors have filled out four lengthy application forms and have provided four copies of their medical school diplomas, state licenses, board certification status, DEA certificates, state drug dispensing registrations, malpractice insurance policies, and so on to document and account for every moment of time since they graduated from medical school.

Each hospital in turn, devotes as much as seventeen hours of staff time per physician writing to the medical school, state licensing boards, specialty boards, federal and state agencies, residency programs, insurance companies, and other hospitals to obtain independent verification of each physician's credentials. Every two years the whole process is practically repeated at each hospital as each physician goes through the process of applying to be reappointed to the medical staff.

With centralized credentialing, a single organization serves as a clearinghouse for gathering and making available those documents needed to verify a physician's credentials.

A physician fills out only one application form, and that form is used by all participating hospitals. When the physician comes up for reappointment, the physician verifies and updates the information previously provided.

The clearinghouse staff write to each source to verify the physician's background and references, and maintain these documents in a single file, instead of each hospital gathering and building duplicate files. The credential clearinghouse provides a

Editor's Note:

This article is an example of what will appear in the Faculty's soon-to-be published *Physician's Practice Digest* (*PPD*), a publication created to inform Maryland physicians on issues surrounding the business side of today's medical practice. The first issue of *PPD* is scheduled to be off press by mid-Fall 1990.

If you have any comments or suggestions or desire to contribute articles to the *PPD*, please send correspondence to Editor, *Physician's Practice Digest*, 1211 Cathedral St., Baltimore, MD 21201.

certified copy of a physician's file for the use of each hospital's credentials committee.

Benefits of Centralized Credentialing

Centralized credentialing benefits everyone involved. Physicians save a great amount of their own and their office staff's time by filling out only one application for medical staff privileges, instead of three or four. They need make only one copy of their supporting documents. If there are any questions, they answer only one phone call.

Hospital medical staff offices benefit because they can devote their staff time to evaluating the physicians' credentials. Hospital chiefs of staff and department heads will get a single letter asking for an evaluation of a physician's performance rather than four for each physician.

The state licensing boards will benefit because they receive a single letter (rather than four) asking for verification that a physician is licensed and in good standing. The same can be said for medical schools, residency programs, specialty certification boards, and similar organizations.

It is also possible to speak of the benefits to the credentialing process as a whole. In planning the operations of the credentialing service, in designing the forms, and in establishing the procedures it has been possible to combine the best of each hospital's experience with credentialing. The agreed-on uniform application forms and standard streamlined procedures for gathering the supporting verification documents bring a consistency to the credentialing process. That is good for hospitals. It's good for physicians. And it's good for patients.

Questions and Answers

Is centralized credentialing available in Maryland? Yes! Healthcare Credentials Verification, Inc. (HCV) was incorporated February 2, 1990 as a joint project of the Medical and Chirurgical Faculty of Maryland and the Maryland Hospital Association. Thirty-five Maryland Hospitals have joined the credentialing service. HCV began building physician files in June and by September will be processing physician's applications for appointment and reappointment at all 35 hospitals.

HCV is in close contact with the Maryland Board of Physician Quality Assurance, the DHMH Division of Licensing and Certification, and the Joint Commission for the Accreditation of Health Care Organizations (JCAHO). HCV's files and operations meet all regulatory requirements of these agencies.

Does HCV actually do the credentialing? No, credentialing is the responsibility of each hospital's board of trustees with the advice of the medical staff.

HCV serves a single function. It is the comprehensive and confidential clearinghouse for all the documents and references that Maryland law and the JCAHO require a hospital to gather and review when considering appointing a physician to the medical staff and renewing each physician's appointment every two years.

HCV makes no judgment about the documents or the information they contain. Each hospital's medical staff must review the applications, documents, and references and then offer the appropriate recommendations to the hospital board of trustees regarding each physician's appointment or reappointment.

How does a physician use HCV? If a physician is seeking privileges for the first time at a hospital, the physician contacts the hospital medical staff office, as has been done in the past. After it has determined that the physician meets any criteria that the hospital might have for appointment (for example, having an office within a certain distance from the hospital) the hospital will ask HCV for the documents and references needed to support the physician's request for privileges.

HCV will send to the physician a uniform medical staff application form and a form authorizing other organizations and individuals to release information to HCV and for HCV to release the information to hospitals where the physician seeks privileges or currently practices.

The form already will contain some information about the physician. The physician is asked to complete, correct, and update all the information on the application and return it along with the authorization form to HCV.

HCV will gather from the original sources any needed documents not in its file or that, on the basis of the application, require updating. HCV will keep both the physician and the hospital informed of any documents it is having difficulty gathering (such as certificate of graduation from a no longer existing medical school, residency program not responding, etc.).

HCV will send periodic follow-up requests, telephone nonrespondents, and send requests by certified mail if necessary. Within 60 days, HCV will provide the hospital with a certified copy of the necessary documents and references and notify the physician that the process is completed.

One hundred eighty days prior to when a physician is due for reappointment, HCV will notify the hospital and request authorization to begin the reappointment process.

HCV will then send the physician a reappointment application form with the information from previous and other appointments. Again, the physician is asked to verify, correct, and update this information and return the form to HCV. HCV will gather the additional documents and materials necessary to update the information and within 60 days send a certified copy of the documents needed for reappointment to the hospital.

HCV also will track for each physician key expira-

tion dates on such things as state licensure, DEA and CDS licensure, and malpractice insurance. HCV automatically seeks verification that such licenses and policies have been renewed as part of the process of keeping each physician's file as current as possible.

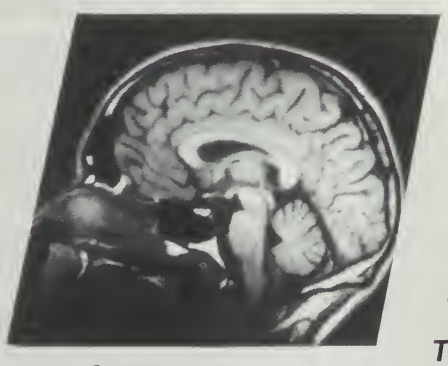
Can a physician apply to HCV directly? No. Physicians must follow the application process of those hospitals where they seek or hold privileges. Where a physician seeks or holds privileges at a hospital that does not subscribe to HCV's services, the physician is encouraged to discuss HCV with the chief of the medical staff and the hospital administration.

What about confidentiality? House Bill 1255 of 1990 specifically determined that Healthcare Credentials Verification's files are confidential and not subject to disclosure. HCV's files cannot be subpoenaed.

HCV will gather a physician's documents only if authorized by the hospital and the physician. HCV gathers and maintains only the information required by state regulations as part of the hospital credentialing process. It will release the documents only to the hospital's credentialing committee.

HCV's policies regarding the confidentiality of its files are developed with input from the Medical and Chirurgical Faculty's Hospital Medical Staff Committee.

Six physicians, appointed by the Medical and Chirurgical Faculty, sit on HCV's board of directors, which establishes HCV's policies governing the gathering and release of information.



HCV's files are kept in a separately secured and alarmed area that is accessible only to HCV's credentialing staff. Maintenance and housekeeping personnel never have access to the file area. No files or documents are left outside the file area when not in use.

Who pays for centralized credentialing? Healthcare Credentials Verification contracts with each of its participating hospitals for its services. Hospitals are charged a fee for each initial appointment and each reappointment processed. HCV does not charge or bill physicians.

Some hospitals absorb these fees. Others pass part or all of the fees on to their physicians as part of their application fees and medical staff dues. ■

ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

MARYLAND DIAGNOSTIC IMAGING CENTER

7120 Contee Road
Laurel, Maryland 20707

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

TO SCHEDULE APPOINTMENTS FOR YOUR PATIENTS, CALL US AT (301) 725-8995.

POS Physicians Office System

"With POS, you get the strength and stability of SMS, the leading provider of healthcare information systems, combined with the personalized service that you would expect only from a small company."

In today's demanding and ever changing healthcare environment, you need an information system that will help you meet business challenges and competition head-on.

SMS' Physicians Office System (POS) can give you that edge. POS is a comprehensive medical information system offering all the features required by large clinics, but designed specifically for solo and group medical practices.

- **Advanced Features.** POS capabilities go far beyond billing office functions - they also include extensive management and clinical tools, HMO support, automated appointment scheduling and physicians access to patient information residing in your hospital's system.

- **Backed By The Industry Leader.** POS system software is developed and offered by SMS, the leading provider of healthcare information systems in the U.S. and Europe. With over 20 years of experience and 10,000 physicians as clients nationwide, SMS will be around to support you not only today, but in many years to come.

- **State-Of-The-Art Hardware.** POS runs on state-of-the-art IBM hardware that is easily expandable and adaptable to future requirements. With IBM, you can be sure that your medical information system uses the best and most valued hardware in the marketplace.

But most importantly - POS is delivered with a personal touch. SMS representatives are involved with our clients from the moment they choose our system. We provide continuity by guiding them through both their training and system installation. And we are always available to answer questions and to help them accommodate new regulatory requirements.

Call us today - and learn more about the POS personal touch.

MMPAC

Mr. President and Members of the House of Delegates:

The Maryland Medical Political Action Committee (MMPAC) has enjoyed tremendous success over the past year. One of the most encouraging trends is the increasing participation of physicians in the political process. It is becoming increasingly apparent that decisions affecting our practices and the lives of our patients are being made in the political arena. Traditionally, medicine has found few allies in carrying out the task of providing the highest quality healthcare.

In a time when most business and labor organizations are advocating "cutting healthcare costs at all costs," we physicians find ourselves fighting to preserve the health and well-being of our patients against mounting pressure by insurance carriers to reduce care to patients. MMPAC has become the voice of the practicing physician. It has become the vehicle by which our views can be expressed to elected representatives who are deciding issues that affect public health policy. MMPAC is the only political action committee that presents the views and concerns of practicing physicians to elected representatives.

This year has been particularly important to the needs of physicians because all state representatives are up for reelection in 1990; this has provided MMPAC with a unique opportunity to have an impact on public policy. MMPAC has reviewed the records of legislators and has supported those incumbents who have supported the concerns of physicians. Similarly, MMPAC has interviewed those candidates seeking office and analyzed whether they represent the best chance of preserving the highest standards of healthcare.

In targeting measures for defeat, the political action committee works through a network of key physician contacts. MMPAC has physicians in each legislative district who can be called into action at a moment's notice to contact their local elected officials. This system can place literally hundreds of calls into an official's office in a very short period.

During the 1990 Maryland General Assembly, MMPAC helped defeat an ever-growing list of threats to physician autonomy. Some of the measures defeated included:

1. Mandated Medicare Assignment
2. Mandated Medicaid Assignment tied to medical licensure
3. Reversal of Tort Reform measures
4. Regulation of physician fees by Health Care Services Cost Review Commission
5. Prohibition of physician investment in ancillary healthcare services

In general, decisions about political action and contributions are made by the MMPAC Board of Directors, which comprises a democrat and republican physician from each congressional district. The MMPAC Board also has a number of at-large members. Committee officers are elected during the annual meeting of Med Chi in odd-numbered years. Bipartisan and administered in a democratic fashion, MMPAC draws its strength from grass-roots support of physicians who pay a $100 membership fee that entitles them to membership not only in the Maryland Medical Political Action Committee but also in the American Medical Political Action Committee (AMPAC), which ensures our voices are heard at the federal level.

Take a break from your routine. Learn to jump out of an airplane in airborne school. Survive Field Survival Training with a Special Forces unit. Or put your skills and endurance to the test in a Combat Casualty Care Course.

The Army Reserve can take you abroad. And to the forefront of medicine, where you'll experience the kinds of training and education environments that only the Reserve can offer.

Your commitment? Sixteen hours a month. Fourteen days a year. Less, in some cases, should your civilian practice demand it.

Find out more about how we operate. And in exchange for your skills, live the adventure of your life.

Call 1-800-USA-ARMY ext. 431 today.

ARMY RESERVE MEDICINE. BE ALL YOU CAN BE.

Because safety cannot be taken for granted in H_2-antagonist therapy

AXID®
nizatidine

Minimal potential for drug interactions

Unlike cimetidine and ranitidine,[1] Axid does not inhibit the cytochrome P-450 metabolizing enzyme system.[2]

Swift and effective H_2-antagonist therapy

- *Most patients experience pain relief with the first dose[3]*
- *Heals duodenal ulcer rapidly and effectively[4,5]*
- *Dosage for adults with active duodenal ulcer is 300 mg once nightly (150 mg b.i.d. is also available)*

AXID®
nizatidine capsules

Brief Summary. Consult the package literature for complete information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to eight weeks of treatment. Most patients heal within four weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than one year are not known.

Contraindication: Known hypersensitivity to the drug. Use with caution in patients with hypersensitivity to other H_2-receptor antagonists.

Precautions: *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix® may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a two-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,900 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events was due to the drug.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to three times the upper limit of normal, however, did not significantly differ from that in placebo patients. Hepatitis and jaundice have been reported. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H_2-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H_2-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Because cross-sensitivity among this class has been observed, H_2-receptor antagonists should not be administered to those with a history of hypersensitivity to these agents. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance by approximately 84%.

The Duty to Warn: The Present Law

Historically, communications between patient and physician have been considered confidential. In describing the rationale for this confidentiality Freedman and Redlich maintain that divulging information could be harmful to the patient and the treatment and, therefore, should not occur. Patients "would be deterred from seeking treatment." They "would not trust" their therapists if they felt confidential information might be divulged. This lack of trust would undermine treatment. Freedman and Redlich note that the "ultimate principle is not silence at any cost but what is in the patient's best interest."[1] What was in the patient's best interest was strongly skewed toward keeping confidentiality.

In 1967 a chapter on forensic psychiatry by Dr. Lawrence Freedman, in a major textbook of psychiatry, noted that psychiatrists have an "ethical imperative" to hold everything patients may say in "strict confidence." The discussion of divulging confidential information was conceptualized in terms of legal interactions as, for example, whether and when to divulge information in the courtroom. A discussion of the subject of unpredictable homicide by schizophrenic patients noted the harm to bystanders being injured or killed. However, no mention of warning potential victims was made. Likewise, there was no mention of homicidal ideation of nonpsychotic patients or of a duty to warn in these situations.[2]

Before 1974, the duty of confidentiality rarely was questioned by either the professional community or the lay public. Health professionals as a group generally were not seen as being legally responsible for the safety of others. In fact, physicians could risk legal consequences if they breached confidentiality in order to warn others who might be at risk.[3] A patient could argue that he/she had no actual intention to harm, that his/her homicidal thoughts were only fantasy, and that no injury had been done. Since no injury had been done, a physician was not seen as having the right or responsibility to divulge confidential information to others. The *Tarasoff* decision in 1974 changed this balance between confidentiality and a duty to warn.

The *Tarasoff* case involved a patient who was in psychiatric outpatient treatment at a mental health clinic at the University of California. In the course of treatment sessions, the patient revealed his wish to kill a young woman who "was readily identifiable" at Tatiana Tarasoff. The case was discussed with two psychiatrists at the clinic, and on their advice, the treating psychologist wrote a letter to the university campus police requesting that they apprehend the patient for hospitalization. The police questioned the man, found him "rational," and released him upon his promise not to harm Tarasoff. The patient subsequently murdered Tarasoff. In litigation, the parents of the victim brought legal suit against all involved for not warning their daughter of the threat against her life.[3]

The lower court and the Court of Appeals rejected the plaintiffs' allegation. But the California Supreme Court (1974) upheld it,[4] declaring that clinicians have a legal duty to warn victims of foreseeable violence. The judge writing the majority opinion stated, "protective privilege ends where public peril begins." Clinicians now had a duty not only to patients but also to potential victims of patients' violent actions.

Two years later (1976),[5] this duty was modified into a duty to protect. "When a therapist determines or should determine that his patient presents a serious danger of violence to another, he incurs an obligation to use reasonable care to protect the intended victim against such danger."[6] Confidentiality had changed into what Cohen[3] calls a "concealed knowledge of the therapist" when the danger of severe injury or murder existed for a third party. Clinicians now faced a double bind in which both breaching and not breaching of confidentiality were possible grounds for litigation against them.

Although the 1974 *Tarasoff* decision was legally binding only in California, the "spirit" of *Tarasoff* was felt in the other states, including Maryland. Clinicians began more often to warn potential victims, thereby risking a breach of confidentiality lawsuit under Maryland statute.[7] Each clinician had to rely on his or her own individual thinking in making difficult decisions about whether to divulge confidential data. Therefore, formal standards were needed to outline the relationship between patient needs and public safety.[3]

The following case example illustrates the "double bind" clinicians faced between 1974 and 1989: A man in his thirties is admitted to the hospital for a medical procedure and in a comment unrelated to his illness states his intention to kill his wife. In a subsequent interview with the psychiatrist, the patient explains that he and his wife have had a stormy relationship, filled with turmoil, fights, and separations. They are currently together, but she has threatened to leave him and to prohibit him from visiting with their young daughter. The patient is not psychotic or paranoid but believes his wife has been seeing another man. He first began to suspect it several years earlier while in jail for theft. There was a history of prior assault and battery of his wife, requiring stitches in an emergency room and time lost from work. She had not filed charges against him. He had also served a previous jail term for choking a former girlfriend to the point of unconsciousness.

At the end of the interview, the patient stated he felt much better now that he had "spilled my guts" and that he no longer felt like killing his wife. The psychiatrist, concerned and uneasy about the man's impulsiveness

and past history of violence, wondered whether the patient, perhaps after a minor slight of some sort, again might feel homicidal toward his wife and act on his feelings. The psychiatrist wondered if he should call the wife to warn her, in the spirit of *Tarasoff*.

As if knowing what the psychiatrist was thinking, the patient reiterated he no longer had any feelings or thoughts of killing his wife. He added that he did not want the psychiatrist to call or communicate with his wife or to say anything of this conversation, because the patient felt to do so would irreparably harm their relationship, even end it. He said, "she would leave me if she knew I had thoughts of killing her." The patient feared that he would also lose all contact with his little girl.

In this case, the double bind faced the clinician squarely: both breaching and not breaching confidentiality could be grounds for litigation against him.

In July 1989 a new Maryland law created standards for healthcare providers and administrators regarding the duty to warn and to protect.[8] Incorporating both a duty to warn and a duty to protect, the Maryland law applies not only to specialists in mental healthcare but also to all healthcare providers or administrators whose professional duties bring them into contact with patients evidencing these kinds of specific mental health needs and problems.

The law is divided into three parts: (1) setting forth the circumstances, (2) setting forth the duty, and (3) describing the exception to the law of confidentiality. In the first part, the law states,

> a cause of action or disciplinary action may not arise against any mental health care provider or administrator for failing to predict, warn of, or take precautions to provide protection from a patient's violent behavior unless the mental health care provider or administrator know of the patient's propensity for violence and the patient indicated to the mental health care provider or administrator, by speech, conduct, or writing, of the patient's intention to inflict imminent physical injury upon a specified victim or group of victims.

When a patient's intention to inflict imminent physical injury is so communicated, the professional has the duties as set forth in the second part of the law.

> The duty...is...discharged if mental health care provider or administrator makes reasonable and timely efforts to 1) seek civil commitment of the patient; 2) formulate a diagnostic impression and establish and undertake a documented treatment plan calculated to eliminate the possibility that the patient will carry out the threat; or 3) inform the appropriate law enforcement agency and, if feasible, the specified victim or victims of a) the nature of the threat; b) the identity of the patient making the threat; and c) the identity of the specified victim or victims.

Thus the requisite duty is spelled out very simply and clearly.

In the third part of the law, the exception to the duty of confidentiality is described.

> No cause of action or disciplinary action may arise under any patient confidentiality act against a mental health care provider or administrator for confidences disclosed or not disclosed in good faith to third parties in an effort to discharge a duty arising under this section.

The new law is a tangible effort to resolve the "double-bind" dilemma that clinicians have been facing in Maryland for the past 15 years. Clinicians now are protected in taking appropriate, decisive steps to warn and/or protect a third party from the dangerous threats of a patient.

But what of the cautions uttered by our colleagues in the 1960s who were concerned about the loss of treatability through divulging of confidentiality? An uncertain therapeutic price will no doubt be paid by preserving the legal directives embodied in the law. Some threats undoubtedly will be resolved by a therapeutic discussion of the wish and by following the legal requirements set forth in the law. Difficulties may arise in implementation of the law regarding the definition of specific words and circumstances. For example, there may be disagreements about what is a "foreseeable occurrence," what is a "propensity" for violence, and what is an "imminent" risk of danger. When is a danger considered to be present? How can one distinguish clearly the difference between fantasy of violence and an expression of an actual intent to inflict injury? What kind of violence does the law imply? What if the patient only says he's going to "rough a person up," but he has no intent to murder him? What would the clinician's duty be then?

The intent of the law appears to encourage each clinician to use professional judgment in deciding if a patient appears to represent a manifest risk of severe injury to a third party. Professional judgment is required by a clinician or an administrator to determine whether the duty of the law needs to be put into action in any individual case. We hope the new law will provide clarity for the ambiguity that has existed since the *Tarasoff* decision of 1974.

To Delay Can Prove Fatal!

Grave reasons why heart attack symptoms won't wait.

Don't make a fatal mistake. Take immediate action when heart attack symptoms begin.

As doctors, we say this over and over again, maybe to the point of overkill. But the fact is—there is an "overkill" going on: the needless loss of life that occurs when people fail to act in time. And heart attack is still the No. 1 adult killer in America today.

Help eliminate the fatal delay. Free VCR tapes are available on how to set up early cardiac care in your hospital's emergency room and network with the community using a heart attack educational outreach program. Call **(301) 368-3217,** or write to Dr. Raymond D. Bahr, St. Agnes Hospital, 900 Caton Avenue, Baltimore, MD 21229.

Peripheral Neuropathy

Doctor, For about six months, I have had a tingling sensation in my feet that is more annoying at night. My feet feel numb, and sometimes I have a sensation that I have socks on when I do not. What is my problem, and what can I do about it? Is it a complication of my diabetes?

The symptoms you describe are typical of those noted in peripheral neuropathy commonly seen in persons over 30 years old who have had diabetes for ten or more years. Any or all of the diabetic neuropathic syndromes may be the initial clinical manifestation of diabetes in the absence of covert evidence of a carbohydrate metabolic disorder. At times diabetic neuropathy may be very painful, almost driving one to the point of taking narcotic drugs for relief.

Peripheral neuropathy may be either sensory, motor, or combined in its manifestations. In the sensory type, most often the form first recognized by the patient, the nerves of sensation are involved with symptoms of tingling, numbness, pain, and loss of tactile and/or temperature sensation. In motor neuropathy the muscles of the extremities show myopathy, particularly those of the hands and feet. Often there is a feeling of heaviness of the extremities with some loss of coordination and dexterity.

Elaborate neurological testing procedures can be conducted to demonstrate diminished sensory and motor nerve conduction and to prove the diagnosis, but the symptoms and clinical appearance are so typical that such testing often is not done unless required for a disability or legal problem. Clues include bilateral absent ankle jerks, diminished tactile sensation, and bilateral interosseus muscle atrophy of the hands that are otherwise unexplained.

Treatment

There are no panaceas for success. Phenytoin and carbamazepine have been found helpful in about 50 percent of the patients. Both preparations have appreciable side effects and should be used under close supervision. Because a considerable amount of depression accompanies both diabetes and neuropathy, amitriptyline and fluphenazine seem to help many patients.

It is essential to achieve the best possible control of the diabetes to prevent a worsening of the problem. Prevent injury to numb and insensitive feet by never walking barefoot, by checking the bath water for proper temperature by placing a hand or elbow in it before use, and by manually checking the inside of shoes for foreign objects before putting them on.

The pain of neuropathy gradually lessens over many months, and pain medications should be used with caution to avoid narcotic addiction.

TENS (Transcutaneous Electrical Nerve Stimulators) justify a trial if the pain cannot be controlled by lesser means. Multivitamins in megadoses and other preparations have been used but found ineffective unless there is a deficiency of the particular substance administered.

The outlined therapy will be helpful, but total disappearance of the symptoms is not apt to occur. Some degree of acceptance of the problem is necessary.

Physician Placement Services

The Medical and Chirurgical Faculty of the State of Maryland maintains a Placement Service for the convenience of Maryland physicians, hospitals, and communities in search of candidates for positions available in our state. A detailed description of such opportunities should be forwarded to:

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland.

MMJ announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

First Lady Barbara Bush presents a FHE Organ Annie to the Children's Hospital Medical Center

Health Education in Montgomery County

Several years ago as our work in the Auxiliary evolved, a group of physician spouses realized that our dream of establishing a health education center here in the metropolitan area was within our reach but only if we narrowed our focus and dedicated ourselves to that single, long term goal. The result of this realization was the establishment of a 501 (c) 3 not-for-profit Foundation for Health Education (FHE).

Members of FHE engaged in health promotion activities throughout the community with various groups who share their belief that education and prevention are the answers to many of the health issues facing our community. We have been working with the Montgomery County Wellness Task Force for Youth, the Safe Kids Coalition, the Rockville Consortium of Science, Business Against Drugs, the American Heart Association, the Gaithersburg Chamber of Commerce, the Montgomery County Health Department, and of course, the Auxiliary to the Montgomery County Medical Society. In addition, we are becoming known for our sponsorship of health fairs for children from upper county Germantown to downtown Rockville.

While working with the Department of Education, the Foundation had the opportunity to present the ever popular Organ Annie to the First Lady, Barbara Bush. She was so taken with our young lady that she donated the "BB" doll to the Children's Hospital National Medical Center for use in its Child Life Department for their work with families. It was exciting to receive the letter of acknowledgment from the White House and the accompanying picture of the actual presentation to Children's Hospital.

Our Foundation is an active example of what can happen when a few people share their enthusiasm with others. We are pleased that the Montgomery County Medical Society has recognized our efforts and made a financial contribution to support this endeavor.

NORMA JEAN ROSBOROUGH
President, Foundation for Health Education

Auxiliary to the Medical and Chirurgical Faculty of Maryland
JOSEFINA D. FIGUEROA, President; *MELISSA LEFFLER*, Editor

THE WHITE HOUSE

November 8, 1989

Dear Ms. Rosborough,

It was so kind of you to allow Organ Annie to visit us at the White House. She certainly is a well put-together young lady and I especially admire her rich inner qualities -- after all, its what's inside that counts.

On a more serious note, I am sure that Organ Annie does a wonderful job of helping young people better understand the miracle of their bodies and the need to take good care of themselves.

Thank you so much for sharing the work of the Foundation for Health Education, Inc.

With all best wishes,

Warmly,

Barbara Bush

quite a doll!

confidential\, kän-fə-ˈden-chəl\ adj(1759) 1: marked by intimacy or willingness to confide. 2: PRIVATE, SECRET.

nondisciplinary\ nän-ˈdis-ə-plə-ner-ē\ adj(1598) 1a: not of or relating to discipline. b: not designed to correct or PUNISH breaches of discipline.

The Medical and Chirurgical Faculty of Maryland Physician Rehabilitation Committee addresses the health problems of Maryland Physicians with a confidential and nondisciplinary focus. Addiction, Marital/Family conflicts, Psychiatric Illness, Organic Impairment, Physical Handicap... If these are some of the problems, we can help you find the solutions.

In Maryland the Physician Rehabilitation Committee of MED-CHI is available to all physicians, and their families.
The Committee is NONDISCIPLINARY and information is kept CONFIDENTIAL.
If you, a colleague, or family member is in need of our services call:

Scholarships Awarded to Baltimore Students

The Baltimore City Medical Society Foundation, Inc. awarded $12,000 in scholarships to eight Baltimore City medical school students during its meeting in May. Each student received a $1,500 grant.

The scholarship program is funded by contributions from physician members of the Baltimore City Medical Society and their friends and families. Awards are made annually to medical school students from Baltimore City who have demonstrated academic achievement and financial need. Recipients must be permanent residents of Baltimore City, enrolled in or accepted by an accredited school of medicine or osteopathy in the United States, and must be recommended by a member of the Baltimore City Medical Society.

In announcing the 1990-91 awards, Beryl. J. Rosenstein MD, chairman of the Foundation's Board, said that the Board was very impressed this year with the number of highly qualified and motivated students from Baltimore City who had submitted applications: "Given the quality of students represented here we can look for a very fine group of young physicians to serve the citizens of Baltimore in the future."

The members of the Baltimore City Medical Society established the Foundation in 1972 to support city residents in medical school and to aid philanthropic causes in the community. This year, beyond the $12,000 awarded in scholarships, the Foundation contributed $1,000 to Health Care for the Homeless and $500 to the Baltimore City Foundation, Inc.

Paul David Brettschneider received the Elliott R. Fishel MD Memorial Scholarship. Brettschneider graduated from Johns Hopkins University in 1989 with general honors, receiving a BA in biology. The scholarship will support his second year as a medical student at Johns Hopkins University School of Medicine.

The family of Dr. Fishel funds the Elliott R. Fishel MD Memorial Scholarship each year in his honor. Dr. Fishel, a native of Baltimore, served the community as a general surgeon for 35 years. At the time of his death in 1985, Dr. Fishel was the president of the Baltimore City Medical Society.

Saverio Mirarchi will receive (for the second year in a row) the Nathan E. Needle MD Memorial Scholarship to support his fourth year of medical studies at the University of Maryland School of Medicine. Mirarchi graduated from Johns Hopkins University with general honors in 1987, earning a BA in natural science.

Dr. Needle, who retired from the practice of general medicine in 1978, served as president of the Maryland Heart Association, the Maryland Academy of Physicians and Surgeons, and the Maryland Academy of General Practice, and as the first treasurer of the Baltimore City Medical Society Foundation, Inc. Mrs. Nathan E. Needle funds this scholarship annually in her husband's honor.

Charling Rose Williams will receive the Liberty Medical Center Scholarship. Williams graduated from the University of Delaware in 1981 with a BA in biology. The scholarship will support her second year of medical studies at the Southern Illinois University School of Medicine. Williams is the first recipient of this new scholarship, funded by the medical staff of Liberty Medical Center.

Theodore Arthur Dorsay will receive a scholarship from the foundation in support of his fourth year of medical school at George Washington University Medical Center. Dorsay graduated from Johns Hopkins University in 1979 with a BA in biology.

Suzanne Kim Doud will receive scholarship aid toward her second year of medical studies at Boston University School of Medicine. Doud graduated from Smith College in 1987 with an AB degree. She majored in biochemistry and minored in German. Following her graduation, Doud worked in research at Harvard University's Southborough campus and the Rockefeller University.

Vinay Kamat will receive a scholarship in support of his first year of medical studies. Kamat, who will receive his BA in biological sciences in June 1990 from the University of Maryland Baltimore County, has not yet decided which medical school he will attend.

David Brian Lumsden will receive scholarship aid for his first year of medical studies at Pennsylvania State University College of Medicine. Lumsden graduated with high honors from Towson State University in 1985, earning a BS degree with a major in health and a minor in pre-med. In 1988, he received an MS in anatomy from the University of Maryland at Baltimore, and in 1990, an MA in exercise physiology.

Jeffrey Allen Weaver will receive a scholarship in support of his fourth year of medical studies at Howard University College of Medicine; he also received a Foundation scholarship in 1989. Weaver received a BA with honors in biology from the University of Maryland Baltimore County in 1986. ■

In the Matter of
Nathan L. Centers MD
Before the
Maryland Board of
Physician Quality Assurance

Order Terminating Probation and Reinstating License

By Order dated September 29, 1987 (the 1987 Order), the Commission on Medical Discipline (the Commission) predecessor agency to the Board of Physician Quality Assurance (the Board) found Nathan L. Centers MD (Respondent) guilty of committing prohibited acts as set forth in Health Occupations Article, *Annotated Code of Maryland* (HO) §14-504. Specifically, the Commission found Respondent professionally, physically, or mentally incompetent; guilty of abusing narcotics or controlled dangerous substances and guilty of providing professional services while under the influence of alcohol or narcotics, §14-504(a)(4)(8)(9). The Commission suspended the medical license of Respondent, immediately staying the suspension, conditioned upon the Respondent complying with the Conditions of Probation. The Order further provided that two (2) years from the effective date of the Order, that being September 29, 1989, if the Respondent demonstrated to the Board's satisfaction that Respondent had complied with the terms and conditions of his probation, the Board would entertain a petition for altering the terms of Respondent's probationary status.

By letter dated January 26, 1990, Respondent petitioned the Board for Termination of Probationary Status and Reinstatement of His License (Petition) to practice medicine in Maryland. At its meeting on March 28, 1990, the Board reviewed Respondent's petition. Based on the Board's review of the Petition, the Board determined that Respondent had fulfilled the Conditions of Probation contained in the 1987 Order.

Findings of Fact

Based on the information known and available to it, the Board finds that:

1. Respondent received group therapy following his discharge in March 1987 from Sheppard Pratt Hospital (the hospital) until September 1988 when the hospital's aftercare program was discontinued. A report dated November 28, 1988 indicated Respondent was involved in individual psychotherapy twice a week with Dr. Jeffrey Klein covering the last two (2) six (6) month periods. Respondent's therapist certified that Respondent attended Narcotics Anonymous and Alcohol Anonymous meetings.

2. While living at Keswick House, a half-way house, from March 26, 1987 until August 1988, supervised, random weekly urinalyses were performed by Friends Medical Laboratories. All test results were negative. After discharge from Keswick House, Respondent signed a five-year contract with the Committee on Physician Rehabilitation of the Medical and Chirurgical Faculty of Maryland, which has obtained urinalyses on a weekly basis and has provided monthly reports to the Board. Respondent has remained in the Physician Rehabilitation program.

3. Michael G. Hayes MD, Medical Director of Man Alive, confirmed in writing on December 5, 1988 that Respondent has been working at Man Alive and listed his job responsibilities. Permission was granted by the Commission on February 16, 1988 to allow Respondent to work on a part-time basis, ten (10) hours a week for Dr. Richard Schlottman. This employment terminated on April 14, 1988 due to the cost of malpractice insurance coverage. On December 14, 1988, the Board approved employment for Respondent in the Chemical Dependency Unit at the Greater Baltimore Medical Center. In that capacity Respondent worked under the direct supervision of Dr. John Steinberg, Director.

4. Respondent limited his prescribing to writing prescriptions for noncontrolled substances and documented orders for controlled substances in the patient's charts.

5. No complaints were filed that indicate Respondent has violated any provisions of the Act.

6. There is no evidence that Respondent has not practiced fully in accordance with the standards expected of a competent practitioner of medicine in the State of Maryland.

Conclusions of Law

The Board concludes, as a matter of law, that Respondent has satisfactorily complied with all conditions of probation as set forth in the Order of September 29, 1987.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 21st day of May 1990 by a majority vote of the full authorized membership of the Board.

ORDERED that effective as of the date of this Order, the Conditions of Probation imposed on Respondent's practice of medicine by the Board's 1987 Order are hereby TERMINATED and of no further force and effect; and be it further

ORDERED that Respondent's license to practice medicine in the State of Maryland be REINSTATED without any condition or restriction whatsoever; and be it further

ORDERED that this is a Final Order.

ISRAEL H. WEINER MD, Chairman
Board of Physician Quality Assurance

In the Matter of
James M. Hitzrot MD
Before the
Maryland Board of
Physician Quality Assurance

Consent Order

On September 27, 1989 the State Board of Physician Quality Assurance (the Board) voted to charge James M. Hitzrot MD (the Respondent) under MD Health Occ. Code Ann. §14-504(a)(6) and (24) (1989 Cum. Supp.). Accordingly, on April 23, 1990, the Board issued charges under the Maryland Medical Practice Act.

The pertinent provision of §14-504 provide:

> (a) Subject to the hearing provisions of §14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full membership, may reprimand any license, place any licensee on probation, or suspend or revoke a license if the licensee:
> (6) abandons a patient;
> (24) Willfully submits false statements to collect fees for which services are not provided.

On June 6, 1990 a settlement conference was held.

As a result of negotiations entered into during the settlement conference, Respondent agreed to the following Consent Order.

Findings of Fact

1. At all times relevant to these charges, Respondent was and is licensed to practice medicine in the State of Maryland.

2. On March 11, 1986, Patient A, an 83-year-old female, sought medical care at the O'Donnell Square Medical Center where she was diagnosed as having a fractured femur and referred to Respondent, an orthopedic surgeon.

3. At the O'Donnell Square Medical Center, Patient A's daughter, B, spoke with Respondent via the telephone. Respondent said that he would care for Patient A at Church Hospital. B said that Patient A would prefer to be admitted to St. Joseph's Hospital. Since Respondent had admitting privileges at St. Joseph's, Respondent said that he would call St. Joseph's and arrange for her admission.

4. B drove Patient A to St. Joseph's where Patient A was admitted on March 11, 1986, at 1:38 p.m. to Respondent's service.

5. Respondent did not see and did not examine Patient A at St. Joseph's.

6. On March 14, 1986, at 12:30 p.m., Patient A was transferred to Dr. X's service after Patient A's family complained that Respondent had not seen Patient A. Dr. X examined the patient and diagnosed an intra and supracondylar fracture of the left femur.

7. On March 16, 1986, after a medical evaluation, Dr. X performed an open reduction and internal fixation of the patient's left femur.

8. Although Respondent made arrangements by telephone for Patient A to be admitted to St. Joseph's Hospital, Respondent failed to see the patient within 24 hours of admission. Respondent failed to request a consult by an internist for the patient. Respondent failed to provide a definitive treatment plan.

9. The standard of care requires that the admitting physician see a patient within 24 hours of admission. The standard of care requires that a physician *personally* render care.

Conclusions of Law

Based on the Findings of Fact, the Board concludes, as a matter of law, that Respondent violated MD Health Occ. Code Ann. §14-504(a)(6) (1989 Cum. Supp.) and finds Respondent guilty of abandoning a patient.

The Board finds that there are no grounds to support a violation of MD Health Occ. Code Ann. §14-504(a)(24) and hereby dismisses the charge.

Order

Based on the foregoing Findings of Fact, it is this 29th day of June 1990, by an affirmative vote of the majority of the full authorized membership of those members of the Board of Physician Quality Assurance of Maryland who considered this case,

ORDERED that Respondent is REPRIMANDED; and be it further

ORDERED that this is a final order.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Consent

By this Consent, I hereby submit to the entry of the above Findings of Fact and Conclusions of Law and agree to accept the foregoing Consent Order.

1. I acknowledge the Board's jurisdiction and the validity of this Order as if made after a hearing in which I would have had the benefit of counsel, the right to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my right to appeal any adverse ruling of the Board that might have followed any such hearing. By this Consent, I waive all such rights.

2. I am represented by Eugene L. Miles, Esquire, and Donald M. Barrick, Esquire, and I have consulted with them before signing this Order. I sign this Order voluntarily, fully understanding its meaning.

JAMES M. HITZROT MD

In the Matter of
Leonard L. Kogan MD
Before the
Maryland Board of
Physician Quality Assurance

Consent Order

On February 5, 1988 the Commission on Medical Discipline[1] (the Commission), charged Leonard L. Kogan MD (the Respondent) with a violation of Md. Health Occ. Code Ann. § §14-504(4) and (23) (1986). *See* Charge Letter, attached as Exhibit A and incorporated herein.

Specifically, pursuant to Md. Health Occ. Code Ann. §14-504 (1986) the Commission charges that Respondent:

> (4) Is professionally, physically, or mentally incompetent; and
> (23) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State.

On January 25, 1989 a settlement conference was held. As a result of negotiations entered into during the settlement conference, Respondent agreed to enter into a Disposition Agreement and simultaneously executed a Consent Order.

On June 28, 1989 a second settlement conference was held. As a result of further negotiations entered into during the settlement conference, Respondent agreed to enter into a Disposition Agreement, which is attached as Exhibit B hereto and incorporated herein, and simultaneously execute this Consent Order.

Findings of Fact

1. At all times relevant to this Order, Respondent was and is currently licensed to practice medicine in Maryland.
2. Respondent is an ophthalmologist practicing at Holy Cross Hospital and Suburban Hospital.
3. Ten randomly selected records from Holy Cross Hospital and ten randomly selected patient charts from Suburban Hospital were reviewed by members of the Peer Review Committee of the Medical and Chirurgical Faculty and reviewers selected by the Commission.
4. The peer reviewers found that Respondent's hospital records were incomplete and deficient in the following respects:
   (a) All ten of the Holy Cross Hospital charts examined contain an operative note with *identical words*, phrases, and descriptions about the cataract surgery performed. The operative notes do not indicate which eye received surgery.
   (b) In one Holy Cross Hospital chart, the operative note indicates that only local anesthesia was given. The anesthesia note indicates that general anesthesia was given. In fact, both local and general anesthesia were given.
   (c) Five Suburban Hospital charts do not contain an operative note although Respondent performed surgery in all five instances in which a chart exists.
   (d) In two Suburban Hospital charts, the "standard" operative note, as described in paragraph (a) above, indicates an intraocular solution was used that is contraindicated for the surgery performed. Respondent used an appropriate intraocular solution but dictated the operative note incorrectly.
   (e) Respondent performed surgery for a patient with glaucoma at Suburban Hospital. Respondent performed an iridectomy as part of the glaucoma surgery but failed to indicate this in the operative note.
   (f) In three hospital charts, Respondent did not record the preoperative visual acuity.
   (g) In one hospital chart, there was no evaluation of the laboratory findings of preoperative glycosuria, elevated blood sugar, and ischemic EKG changes. There was no designation of which eye had the cataract, and on the surgery notes there is no evaluation of the funduscopic examination performed preoperatively.
   (h) In one hospital chart, Respondent did not cosign the history and physical examination.
   (i) In one hospital chart, Respondent did not sign the progress notes.
   (j) In one hospital chart, there was no preoperative evaluation of the finding that the patient was insulin dependent, with a blood sugar of 263, and had not seen a physician for this condition in two (2) years. On discharge, there was no referral to another physician for the patient's medical conditions excluding his eye surgery. Respondent made a referral upon discharge but did not document the referral.
   (k) In one hospital chart, there was no preoperative evaluation of the patient's glaucoma (that is, visual fields and appearance of the optic nerve), no indication of the method of surgical management of the glaucoma, and no mention of the diagnosis of glaucoma on the face sheet.
   (l) In one hospital chart, although the patient had glaucoma, there was no mention of the medical or surgical management of the glaucoma.
   (m) In one hospital chart, there was no explanation why cataract surgery previously performed in one eye had a poor visual result.
   (n) Respondent performed surgery for a complication from a prior cataract surgery. The

1. The 1988 General Assembly, by Senate Bill No. 508 and House Bill No. 855, merged the functions of the former Commission on Medical Discipline and the former Board of Medical Examiners into the State Board of Physician Quality Assurance.

patient was blind in the eye that was not operated on but there is no indication in the hospital chart of what caused the blindness.

5. Respondent and the Board entered into a Disposition Agreement, Exhibit B. The Disposition Agreement provided that if Respondent violated one of conditions of the Disposition Agreement, the Board would immediately execute this Consent Order, which incorporates the Disposition Agreement.

6. Respondent admits that he kept inadequate medical records as specified in paragraph four (4) above.

Conclusions of Law

Based on the forgoing Findings of Fact, the State Board of Physician Quality Assurance[2] (the Board) concludes that Respondent violated Md. Health Occ. Code Ann. §14-504(23) (1986). Respondent failed to meet the appropriate standards as determined by appropriate peer review for the delivery of quality surgical care performed in a hospital in this State because Respondent failed to maintain complete and accurate medical records.

The Board finds that there are no grounds to support a violation of Md. Health Occ. Code Ann. §14-504(4) (1986) and hereby DISMISSES the charges pursuant to Md. Health Occ. Code Ann. §14-506(b) (1988 Cum. Supp.).

Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is hereby ORDERED this 20th day of June 1990, by the Board, that Respondent is REPRIMANDED, and it is further

ORDERED that the Board may place Respondent on Probation with any conditions the Board deems appropriate.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

Consent

By this Consent, I hereby admit to the Findings of Fact contained in this Order. I hereby agree to be bound by the foregoing Consent Order and its conditions and restrictions.

I am entering into this Consent Order for the purpose of resolving the charges initiated by the Commission on Medical Discipline and the Board of Physician Quality Assurance against my license to practice medicine as defined in the Charge Letter dated February 5, 1988 attached as Exhibit A.

I acknowledge the validity of this Order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this Order.

I understand that if I fail to abide by the conditions of the Order, I may suffer disciplinary action against my license to practice medicine in the State of Maryland.

LEONARD L. KOGAN MD

EXHIBIT A

February 5, 1988

HAND DELIVERED

Leonard L. Kogan MD
8630 Fenton Street
Silver Spring, MD 20910

Re: Commission of Prohibited Act
under the Maryland Medical Practice Act

Dear Dr. Kogan:

By the enclosed "Charges Under the Maryland Medical Practice Act" (the Charge), the Commission on Medical Discipline (the Commission) charges under the Maryland Medical Practice Act (the Act), Title 14 of the Health Occupations Article, *Annotated Code of Maryland*. If the Commission finds you guilty of the charges, the Commission may reprimand you, place you on probation, suspend or revoke your license.

Under §14-505 of the Act, you are entitled to an evidentiary hearing on the charges. The Commission has scheduled the hearing for Tuesday, March 29, 1988 at 1 p.m. in L-3 of the O'Conor Building, 201 West Preston St., Baltimore, MD 21201. The administrative prosecutor who will present the case against you is Barbara Hull Foster, Assistant Attorney General. Please be advised that if you do not appear at the hearing, the Commission has the authority to hear and determine the matter despite your absence.

In addition to the hearing, the Commission has scheduled a prehearing conference for Tuesday, February 23, 1988 at 11:30 a.m. at the office of Dr. Reynaldo Lee-Llacer, 8909 Old Branch Ave., Clinton, MD 20735, a representative from the Commission. The purpose of the prehearing conference is to prepare for the hearing. Accordingly, please be prepared to discuss hearing dates, witness lists, and general hearing procedure at the prehearing conference.

The administrative prosecutor may be contacted regarding the settlement of this matter. If a settlement is reached with the administrative prosecutor, that settlement should be presented to the representative from the Commission at the prehearing conference. If the Commission member thinks that the agreement reached between you and the prosecutor will be approved by the Commission, the representative may choose to present the agreement to the Commission. The Commission may accept or reject the settlement. If the Commission rejects the settlement, the parties will then proceed to a hearing.

In the event of a hearing, the proceedings before the Commission will be conducted in accordance with the Administrative Procedure Act, §10-201 *et seq.* of the State Government Article, *Annotated Code of Maryland* and regulations adopted by the Commission, COMAR 10.31.01. The Administrative Procedure Act gives you the right to be represented by counsel, call witnesses, present evidence, cross-examine any witness, and present argument and summation.

Because any decision made by the Commission could affect your license to practice medicine in the State of Maryland, you are strongly urged to retain and be represented by an attorney at the prehearing conference and at all other stages before the Commission. To appear on your behalf at the prehearing conference or hearing before the Commission, your attorney should be admitted to the Bar in Maryland or specially admitted under Maryland Rule 20.

If you or your attorney have any questions about the charges, please contact Ms. Foster at the Office of the Attorney General, 300

2. The Board is the successor agency of the Commission on Medical Discipline.

West Preston St., Suite 302, Baltimore, MD 21201 (301-225-1846/1859).

Very truly yours,

RONALD J. TAYLOR MD, Vice Chairman
Commission on Medical Discipline

In the Matter of Leonard L. Kogan MD Before the Commission on Medical Discipline

Charges Under the Medical Practice Act

Based on information received by the Commission on Medical Discipline (the Commission) and a subsequent investigation by the Medical and Chirurgical Faculty of Maryland (Med Chi), the Commission hereby charges LEONARD L. KOGAN MD (Respondent) under §14-504(4) and (23) of the Medical Practice Act (the Act), Title 14, Health Occupations Article, *Annotated Code of Maryland*. Section 14-504 of the Act permits the Commission to impose sanctions on a licensee who:

> Is professionally, physically, or mentally incompetent; [§14-504(4) of the Act]
>
> Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality ... surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State; [§14-504(23) of the Act]

Allegations of Fact

The bases of the charges are as follows:

1. At all times relevant to these charges, the Respondent was and is licensed to practice medicine in Maryland.
2. Respondent is a practicing ophthalmologist who practices at Suburban Hospital and Holy Cross Hospital.
3. Random hospital and office records of patients treated by Respondent were reviewed by the Medical and Chirurgical Faculty Peer Review and reviewers selected by the Commission.
4. The reviewers found that:
   a. Respondent's medical records and hospital records were deficient in several aspects including but not limited to:
      1) For patients A, B, C, D, E, and F there were no operative notes;
      2) There were errors in the patients' hospital records for G, H, I, and F:

         With patients G and H the operative notes contained an error as to the intraocular solution used insofar as the intraocular solution used was contraindicated for the surgery performed.

         With patient I, the standard note indicates a local anesthetic was used while the anesthesia note indicates a general anesthetic was used.

         With F, her health was noted as "good" and she was stated to be on no prescriptions although she had an upper respiratory infection and was on tetracycline.

      3) The following patient hospital records were not individually prepared but were made on standardized forms which did not vary from patient to patient: G, H, I, J, K, L, M, N, O, P, Q, and R.

         In general, the records from Holy Cross Hospital were on standardized forms and there were no operative notes indicating which eye received surgery.

      4) The patient records were incomplete:

         On the hospital records of C, B, Q, there was no preoperative visual acuity recorded.

         With patient A, there was no evaluation of the laboratory findings of preoperative glycosuria, elevated blood sugar, and ischemic EKG changes. There was no designation of which eye has the cataract, and on the surgery notes there is no evaluation of the funduscopic examination performed preoperatively.

         With patient B, Respondent did not cosign the history and physical examinations, and with F, Respondent did not sign the progress notes.

         With patient E there was no preoperative evaluation of the findings that he was insulin dependent, with a blood sugar of 263, and had not seen a physician for this condition in two (2) years. On discharge, there was no referral to another physician for the patient's medical conditions excluding his eye surgery.

         With patient H, there is no preoperative evaluation of his glaucoma, no indication of the method of surgical management of the glaucoma, and no diagnosis on the face sheet of the glaucoma.

         There is no mention of patient R's glaucoma in the hospital notes.

         With patient S there was no mention of the performance of an iridectomy at surgery, which is a usual part of surgery performed.

         With patient L, there is no explanation as to why cataract surgery in one eye previously performed had a poor visual result.

         With patient O, there is no indication why the patient is blind in the opposite eye from the one on which the operation was scheduled.

         Although patient R was admitted postoperatively for nausea, vomiting, and increased blood pressure, the nurses' notes after admission do not indicate that there were these symptoms.

         With patients T, J, K, Q, and G there was no indication of which eye is involved for cataract surgery.

      5) Respondent fails to record on the hospital records the proper evaluations prior to surgery, such as funduscopic examinations and visual acuity.

   b. Respondent's medical practice is deficient insofar as:
      1) Respondent failed to evaluate or request consultation of medical findings when the

following patients' medical condition required such evaluation or consultation.

With patient A there was neither a medical evaluation of the laboratory findings of preoperative glycosuria, elevated blood sugar, occult blood in the urine, elevated sedimentation rate, and ischemic EKG changes or a request for a consultant to examine the patient. This patient's hypertension, diabetes, and cardiovascular disease was not reviewed and surgical risks were not medically evaluated prior to surgery.

With patient E there was neither a medical evaluation performed nor consultation requested in spite of the findings that the patient was insulin dependent, had a blood sugar of 263, and had not seen a physician for an examination in two (2) years. Respondent did not refer the patient to an attending physician upon discharge.

With patient F there was neither a medical evaluation performed nor consultation requested in spite of an abnormal chest film, an abnormal EKG and upper respiratory infection. Although Respondent was notified of the results of an abnormal EKG and chest x-ray there is no indication why he proceeded with an elective surgery.

There was neither a medical evaluation nor a consultation regarding patient O's hypertension prior to surgery.

There was neither a medical consultation nor an evaluation of patient S's surgical risk prior to surgery, considering the patient's heart disease and diabetes. There is no note of the increased fasting blood sugar present on the evaluation preoperatively for the attending's consideration. Although a standard x-ray was taken and a standard EKG done there was no evaluation of same.

2) Respondent performed unnecessary surgery:

There was no justification for the glaucoma surgery performed on S. There was no justification for performing two (2) separation operations on S when the procedures could have been performed simultaneously.

Respondent operated on patient L's left eye when he should have known there would be no improved vision. Respondent advised against cataract surgery for patient L. Upon patient L's request for the surgery, Respondent performed same when there were no facts indicating that he should change his opinion to operate on the right eye. A subsequent YAG laser treatment was unnecessary.

Laser surgery for patient R's right eye was not indicated.

3) Respondent failed to request a smear and culture on exudate when performing surgery as a result of complications from preceding cataract surgery, patient O.
4) Respondent failed to give instructions to patient R concerning the use of existing medications.

c. Respondent's medical knowledge is deficient:
1) Respondent did not properly surgically manage the following patients who had glaucoma.

With patient H there was no indication that the glaucoma was managed after surgery with Timoptic or its equivalent.

R had glaucoma. There is no indication of surgical or medical management of the glaucoma after Respondent performed cataract surgery on her left eye either by using Timoptic or its equivalent.

Patient M had glaucoma. There is no indication that Respondent surgically treated the glaucoma with Pilocarpine after surgery or discharged her with any prescription.

Respondent performed laser surgery on patient R when the single visual field test did not indicate progressive visual field loss or lack of medical control of the glaucoma.

Respondent operated too prematurely on the second half of the left eye with laser surgery for glaucoma, patient R.

The glaucoma surgery on patient S was not justified.

2) The use of 10 percent phenylephrine eyedrops preoperative is inappropriate in a hypertension patient, patient R.
3) Although patient M was asthmatic and thus Timoptin (a beta blocker) was contra-indicated, Respondent continued to prescribe same.
4) Respondent stated that the use of myotics after cataract surgery would cause uveitis with Patient S, which is erroneous.

Notice of Possible Sanctions

If, after a hearing, the Commission finds the above allegations of facts to be true, the Commission may impose disciplinary sanctions against Respondent's license, including revocation, suspension, or reprimand, and may place the Respondent on probation.

Notice of Hearing and Prehearing Conference

A hearing in this matter has been scheduled for Tuesday, March 29, 1988, at 1 p.m., in L-3 of the O'Conor Building, 201 West Preston St., Baltimore, MD 21201.

In addition, a prehearing conference in this matter has been scheduled for Tuesday, February 23, 1988 at 11:30 a.m. at the office of Dr. Reynaldo Lee-Llacer, 8909 Old Branch Ave., Clinton, MD 20735. The nature and purpose of the prehearing conference is described in the attached letter to Respondent.

RONALD J. TAYLOR MD, Vice Chair
Commission on Medical Discipline

In the Matter of
Leonard L. Kogan MD
Before the
Commission on Medical Discipline

Summons and Notice of Charges and Hearing

You are hereby summoned to appear at a hearing before the Maryland Commission on Medical Discipline (the Commission) to determine whether you

have committed the prohibited acts described in the attached document entitled "Charges under the Maryland Medical Practice Act" and what sanctions, if any, are appropriate. The hearing is scheduled for Tuesday, March 29, 1988 at 1 p.m., in Room L-3 of the O'Conor Building, 201 West Preston St., Baltimore, MD 21201.

This hearing is held under the authority of §14-504 of the Health Occupations Article, §10-205 *et seq.* of the State Government Article, and COMAR 10.31.01.

If you do not appear as required by this summons, the Commission may hear and determine this matter in your absence, as provided under §14-505 of the Health Occupations Article.

RONALD J. TAYLOR MD, Vice Chair
Commission on Medical Discipline

EXHIBIT B

In the Matter of
Leonard L. Kogan MD
Before the
Maryland Board of
Physician Quality Assurance

Disposition Agreement

THIS DISPOSITION AGREEMENT (the Agreement) is made this 11th day of September 1989 by and between the State Board of Physician Quality Assurance[1] (the Board) and Leonard L. Kogan MD (the Respondent).

Whereas, a complaint was filed with the Commission on Medical Discipline (the Commission) against the Respondent; and

Whereas on February 5, 1988, the Commission charged Respondent with a violation of Md. Health Occ. Code Ann. § §14-504(4) and (23) (1986). (*See* Charge Letter, attached as Exhibit A and incorporated herein.)

Specifically, pursuant to Md. Health Occ. Code Ann. §14-504 (1986) the Commission charged that Respondent:

(4) Is professionally, physically, or mentally incompetent; and
(23) Fails to meet appropriate standards as determined by appropriate peer review for the delivery of quality surgical care performed in an outpatient surgical facility, office, hospital, or any other location in this State.

Whereas, on January 25, 1989 a settlement conference was held with Respondent, Counsel for Respondent, Assistant Attorney General and Administrative Prosecutor, a member of the Board, and Assistant Attorney General and Counsel to the Board. As a result of negotiations entered into during the settlement conference, Respondent agreed to a Disposition Agreement; and

Whereas, on June 28, 1989, another settlement conference was held with Respondent, Counsel for Respondent, Assistant Attorney General and Administrative Prosecutor, members of the Board, and Settlement Officer. As a result of negotiations entered into during the settlement conference, Respondent agreed to the following Disposition Agreement; and

Whereas, the Board and Respondent mutually desire to resolve this disciplinary action without holding a formal hearing or imposing a sanction on Respondent that would become part of his permanent licensure record with the Board; and

Whereas, Respondent expressed his willingness to undertake certain obligations in exchange for the Board's agreement to dismiss the charges enumerated in the Charge Letter (Exhibit A).;

Now, therefore, in consideration of the mutual agreements of the parties hereto, as hereinafter set forth, the Board and Respondent agree as follows:

1. Respondent shall execute the attached Consent Order simultaneously with the execution of this Agreement; and be it further agreed

2. The Board shall defer executing the attached Consent Order; provided, however, that the Board may execute the Consent Order, WITHOUT PRIOR NOTICE BUT PRESERVING RESPONDENT'S RIGHT TO A HEARING, upon the occurrence of Respondent's failure to comply with any of the following conditions during a period of one (1) year beginning on August 16, 1989:

a. Within 90 days from August 16, 1989, Respondent shall attend a course designed by the University of Maryland School of Medicine, Department of Ophthalmology in the use of appropriate medical records in the practice of ophthalmology. Two specific areas to be covered in the course are:
   (i) A general overview of medical record requirements using a system like the problem-oriented medical record system; and
   (ii) A follow-up course of how to use such a system in Respondent's specific discipline of ophthalmology.

Respondent shall pay the cost of the course.

b. Respondent shall improve his office and hospital records by using traditional abbreviations and limiting his own personal abbreviations.
c. Respondent shall record which eye is being examined and which eye has been operated on in both office and hospital records.
d. Respondent shall submit to a review of thirty (30) medical records every three (3) months for a period of one (1) year. The record reviews shall occur on or about October 1, 1989, January 1, 1990, April 1, 1990, and July 1, 1990. To avoid any issue of bias, the Board will suggest that the peer review be conducted by a medical society other than the one in the county in which Respondent practices. The Board has complete discretion to select a peer review committee to review the records and prepare a report to the Board. The Board or the peer review committee has complete discretion to select which office and hospital records it chooses to review, and Respondent shall bear any administrative costs associated with the peer review.
e. The purpose of the record review described in section (d) above is to determine whether Respondent's records are reflective of the standard of care within the community in which he practices.
f. Respondent shall practice medicine and surgery in accordance with the Maryland Medical Practice Act, Md. Health Occ. Code Ann. §14-101 *et seq.* (1988 Cum. Supp.); and be it further agreed

3. One year from the effective date of this Agreement the Board shall entertain a petition from Respondent demonstrating that he has fulfilled the terms of this Agreement; and be it further agreed

4. That, if Respondent has complied with all of the terms of this Agreement, and the Board has no probable cause to believe the Respondent cannot practice safely, without danger to the health, safety, and welfare, Board shall dismiss all of the charges set forth in the attached charge letter, Exhibit A and all records relating to those charges shall be expunged, including the attached Consent Order; however, nothing in this Agreement shall be construed to require the expungement of this Agreement that shall remain in Respondent's permanent licensure record as a professional licensing record not subject to public disclosure under the Maryland Public Information Act, Md. State Gov't. Code Ann. § §10-611 - 629 (1988 Cum. Supp.) because it is not an Order of Finding that resulted from

1. The 1988 General Assembly, by Senate Bill No. 508 and House Bill No. 855, merged the functions of the former Commission on Medical Discipline and the former Board of Medical Examiners into the State Board of Physician Quality Assurance.

a formal disciplinary action. If in the future, the Board charges Respondent with a violation of the Maryland Medical Practice Act, this Agreement CANNOT BE used or considered as evidence against Respondent. However, if the charge results in a finding of a violation of the Maryland Medical Practice Act, then this Agreement CAN BE used in considering what penalty, that is, probation, reprimand, suspension, revocation, may be appropriate; and be it further agreed

5. That, if the Board finds probable cause to believe that Respondent violated the Maryland Medical Practice Act or has violated a condition of this order, the Board may execute the attached Consent Order, WITHOUT PRIOR NOTICE BUT PRESERVING RESPONDENT'S RIGHT FOR AN OPPORTUNITY TO BE HEARD, provided that Respondent is notified, and within thirty (30) days of requesting a hearing, Respondent receives a hearing on the charges of Violation of this Order.

WITNESS THE HANDS AND SEALS of the parties hereto, the State Board of Physician Quality Assurance by its Chairman, Israel H. Weiner MD and Respondent, Leonard L. Kogan MD.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

I, Leonard L. Kogan MD, have read this Disposition Agreement and have carefully reviewed each and every part with my attorney. I understand it and voluntarily agree to it.

LEONARD L. KOGAN MD

■ ■ ■

In the Matter of
Ernesto Rivera MD
Before the
Maryland Board of
Physician Quality Assurance

Order Terminating Probation and Reinstating License

By Order (attached hereto) dated June 21, 1988 (the 1988 Order), the Commission on Medical Discipline, predecessor agency to the Board of Physician Quality Assurance (the Board) found Ernesto Rivera MD (the Respondent) guilty of committing a prohibitive act as set forth in Health Occupations Article, *Annotated Code of Maryland* (HO) §14-504. Specifically, the Board found Respondent guilty of immoral conduct in the practice of medicine. The Board reprimanded the Respondent and placed Respondent on probation for two years subject to conditions. The Order further provided that two (2) years from the effective date of the Order, if the Respondent demonstrated to the Board's satisfaction that Respondent had complied with the terms and conditions of his probation, the Board would entertain a petition for termination of Respondent's probationary status and reinstatement of his medical license. By letter dated April 1990, and received by the Board on April 19, 1990, the Board reviewed Respondent's petition for reinstatement of his license to practice medicine in Maryland. At its meeting on June 27, 1990, the Board determined that Respondent had fulfilled the Conditions of Probation contained in the 1988 Order.

Findings of Fact

Based on the information known and available to it, the Board finds that:

1. Respondent identified the facility, Mercy Hospital, in which he practiced medicine.
2. Respondent notified all supervisors, employers, and contractors for whom he provides medical services of the probationary status of his license.
3. Respondent submitted proof, a letter dated November 1, 1988 from James P. Durkan MD, Chairman, Department of OB-GYN, Mercy Hospital, that the Respondent had informed the director of any facility in which he provides medical services of the probationary status of his license, and that Respondent has given the director of any facility in which he provides medical services a copy of this Order.
4. Respondent submitted proof, verification by his employee dated July 1, 1988, that Respondent has informed any employee in his private office of the probationary status of his license, and that the employee was given a copy of this Order.
5. Respondent arranged for the director of any facility in which he provided medical services to submit quarterly reports, attesting to the fact that Respondent had an attendant in the examining room whenever Respondent performed a physical examination. Reports have been received from Beverly J. Stump MD at the Harford County Health Department and James P. Durkan MD at Mercy Hospital.
6. Respondent arranged for his attendant to submit monthly reports in which the attendant stated for each day Respondent had office hours, how many patients were seen, how many required a physical examination, and who was with Respondent when he conducted a physical examination. Reports have been received since July 1988.
7. Respondent acknowledged in a letter dated November 16, 1988 that Henry T. Harbin MD, therapist, was informed of all terms and conditions of the Order.
8. Respondent arranged for therapist to submit written quarterly reports to the Board commencing a month from the date of the Order, indicating that Respondent is making satisfactory progress in dealing with the problems that led to the incident of April 12, 1987. The quarterly reports have been received.
9. By letter dated October 14, 1988, Respondent hired a new employee (Office Assistant). The letter indicated that the new employee read the Order and has a copy of same. She agreed to chaperon for all required examinations with monthly reports submitted, and has so complied.
10. Respondent requested approval, request dated May 1, 1989, of community service through the general gynecology clinic of the Harford County Health Department. The request was approved by the Board

on June 14, 1989 with notification to Respondent on June 20, 1989.

11. There is no reason to believe that Respondent is not practicing medicine in accordance with the laws governing the practice of Medicine in Maryland.

Conclusions of Law

The Board concludes, as a matter of law, that Respondent has satisfactorily complied with all conditions as set forth in the Order of June 21, 1988.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 27th day of June 1990 by a majority vote of the full authorized membership of the Board

ORDERED that effective as of the date of this Order, the Conditions of Probation imposed upon Respondent's practice of medicine by the Board's 1988 Order are hereby TERMINATED and of no further force and effect; and be it further

ORDERED that Respondent's license to practice medicine in the state of Maryland be REINSTATED without any condition or restriction whatsoever; and be it further

ORDERED that this is a Final Order.

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

In The Matter of Ernesto Rivera MD Before the Commission on Medical Discipline

Findings of Fact, Conclusions of Law, and Order

Certain information having come to the attention of the Commission on Medical Discipline of Maryland (the Commission), the Commission, pursuant to Health Occupations Article, §14-501 requested that the Peer Review Committee of the Medical and Chirurgical Faculty of Maryland (Med Chi) review the complaint received against Ernesto Rivera MD (the Respondent). Following a review and report by Med Chi, the Commission determined to charge Respondent with a violation of §14-504(3) of the Act.

Notice of the charge and the allegations supporting the charge was given to Respondent on March 29, 1988 and a prehearing conference was held May 19, 1988. The prehearing conference was attended by Respondent, Respondent's counsel, Respondent's psychiatrist, the administrative prosecutor, Assistant Attorney General, and a representative for the Commission. As a result of the prehearing conference, Respondent agreed to enter into the following consent order.

Findings of Fact

1. At all times relevant hereto, Respondent was and is a physician licensed to practice medicine in the State of Maryland.

2. At all times relevant to the charges, Respondent was practicing as a specialist in obstetrics and gynecology.

3. On or about April 12, 1987, during the course of an ultrasound treatment of a patient, Respondent touched the genital area of the patient without medical justification.

4. Respondent voluntarily entered therapy immediately after the incident.

5. At the time of the incident, Respondent's judgment was affected by substantial emotional stress, which subsequently has been alleviated and controlled through counseling with a Board certified and qualified psychiatrist.

6. Respondent has continued in counseling since the incident and is working out the problems that led to the emotional stress.

7. The Commission only knows of one incident in which Respondent touched a patient sexually without medical justification.

8. Prior to the incident, no complaints had ever been filed against Respondent.

9. The incident in question was unpremeditated, transitory, and impulsive.

10. Respondent graduated from the University of Maryland School of Medicine in 1966, interned in Puerto Rico on a rotating internship, and served in the United States Army during the Vietnam war. Respondent has been an instructor and assistant professor at the medical school in Puerto Rico. Respondent was held the rank of associated professor of OB/GYN at the University of Maryland School of Medicine. Respondent served as Assistant Chief of Obstetrics and Gynecology at Mercy Hospital. Respondent was Board certified in obstetrics and gynecology in 1972 and recertified in these specialties in 1980. He has been involved in the hospital practice of obstetrics and gynecology and in private practice.

11. Respondent admits the inappropriateness of his touching the patient's genital area on April 12, 1987.

12. There is no evidence that Respondent lacks the appropriate skills and competence to safely practice gynecology and obstetrics.

Conclusion of Law

Based on the foregoing Findings of Fact, the Commission concludes a matter of law:

That Respondent committed a prohibited act under the Medical Practice Act, specifically:

"Is guilty of immoral conduct in the practice of medicine." §14-504(3) of the Health Occupations Article, Annotated Code of Maryland

Order

Upon the foregoing Findings of Fact and Conclusion of Law, it is this 21st day of June 1988, by a unanimous vote of those members of the Commission on Medical Discipline of Maryland who considered this case,

ORDERED that Respondent is REPRIMANDED and placed on probation for TWO YEARS subject to the following conditions:

1. Within ten (10) days from the effective date of this Order, that being the date the Commission executes the Order, Respondent shall identify all the facilities in which he practices medicine.

2. Within ten (10) days from the effective date of this Order, Respondent shall notify all supervisors, employers, contractors for whom he provides medical services of the probationary status of Respondent's license.

3. Within two (2) weeks from the effective date of this Order, Respondent shall submit proof acceptable to the Commission that he has informed the director of any facility in which he provides medical service of the probationary status of his license, and that Respondent has given the director of any facility in which he provides medical service a copy of this Order.

4. Within ten (10) days from the effective date of this Order, Respondent shall submit proof acceptable to the Commission that he has informed any employee in his private office of the probationary status of his license, and given that employee a copy of this Order.

5. Respondent must have an attendant in the examining room whenever he performs a physical examination.

6. Respondent shall arrange for the Director of any facility in which he provides medical services to submit quarterly reports, attesting to the fact that Respondent has an attendant in the examining room whenever he performs a physical examination.

7. Respondent shall arrange for his attendant to submit monthly reports in which the attendant states for each day Respondent had office hours, how many patients were seen, how many required a physical examination, and who was with Respondent when he conducted a physical examination.

8. Respondent shall continue in treatment with Respondent's present therapist and inform Respondent's therapist of all terms and conditions of this Consent Order. Respondent shall submit proof acceptable to the Commission that he has so informed his therapist.

9. Respondent shall arrange for Respondent's therapist to submit written quarterly reports to the Commission or a successor agency, commencing a month from the effective date of this Order, indicating that Respondent is making satisfactory progress in dealing with the problems that led to the incident of April 12, 1987.

10. Respondent shall continue in treatment until the therapist certifies in writing that Respondent is ready to stop therapy, and submits a final report to the Commission. The Commission shall approve Respondent's ceasing treatment prior to Respondent's discontinuing therapy.

11. In the event that Respondent terminates therapy prior to discharge by the therapist, the therapist shall immediately notify the Commission that Respondent has left treatment.

12. In the event that Respondent moves permanently or temporarily, Respondent shall notify the Board of Medical Examiners or a successor agency, within ten (10) days of the move.

13. In the event that Respondent changes where he provides medical services, either by adding to his medical duties and responsibilities as an employee, independent contractor, or a private physician, or hires different or additional employees, Respondent shall notify the Commission within ten (10) days of the change. The conditions listed in paragraphs 3-7 will apply, and there must be compliance within two (2) weeks of the change.

14. Respondent shall complete one hundred (100) hours of community service which has been approved by the Commission within two (2) years.

15. Respondent shall not engage in the conduct that led to the charge by the Commission, and shall practice in accordance with the Medical Practice Act; and be it further

ORDERED that in the event the Commission receives information that Respondent does not have an attendant in the examining room when he performs a physical examination, or if the Commission receives a report from Respondent's supervisor or therapist indicating that Respondent has engaged in inappropriate, intimate, or sexual relations with a patient, or that Respondent is a danger to himself, or the public safety, health, or welfare, the Commission, without prior notice and an opportunity to be heard may suspend respondent's license, provided that Respondent is given immediate notice of the charges and an opportunity for a hearing thirty (30) days after requesting same; and be it further

ORDERED that if Respondent violates any other term of Respondent's probation, after notice and a hearing, and determination of failure to meet the condition, the Commission may suspend or revoke Respondent's license; and be it further

ORDERED that after two (2) years after the effective date of this order, the Commission will entertain a petition for termination of Respondent's probationary status and reinstatement of Respondent's license to practice medicine in Maryland without any conditions or restrictions whatsoever. At that time, if Respondent has complied with all conditions of probation and there are no outstanding complaints pending against Respondent, the Commission will reinstate Respondent's license without any conditions or restrictions whatsoever; and be it further

ORDERED that a copy of this Order shall be filed with the Board of Medical Examiners in accordance with Health Occupations Article, §14-507; and be it further

ORDERED that this is a final order.

HILARY T. O'HERLIHY MD, Chairman
Commission on Medical Discipline

Consent

By this Consent, I hereby admit the truth of the Findings of Fact, and accept and submit to the foregoing Order and its conditions. I acknowledge the validity of the Order as if made after a hearing in which I would have had the right to counsel, to confront witnesses, to give testimony, to call witnesses on my own behalf, and to all other substantive and procedural protections provided by law. I also recognize that I am waiving my right to appeal any adverse ruling of the Commission that might have followed any such hearing. By this consent, I waive all such rights and acknowledge that by my failure to abide by the conditions of the Order, I may suffer disciplinary action against my license to practice medicine in the State of Maryland.

I further acknowledge that the Order provides that my license can be suspended without prior notice and an opportunity to be heard in the event that the Commission receives notice from my supervisor or my therapist that I have engaged in intimate or sexual relations with a patient; or that I am a danger to the public safety, health, and welfare, or myself; or that I do not have an attendant in the examining room when I am performing physical examinations. I acknowledge that I will be given immediate notice and an opportunity to a hearing within thirty (30) days of my requesting same.

I sign this Order after having an opportunity to consult with an attorney, without reservation, and I fully understand its meaning.

ERNESTO RIVERA MD

In the Matter of
Wilfredo Fernandez-Vila MD
Before the
Maryland Board of
Physician Quality Assurance

April 1990

Israel H. Weiner MD, Chairman
Board of Physician Quality Assurance
Department of Health and Mental Hygiene
P.O. Box 2571
4201 Patterson Avenue
Baltimore, MD 21215-0002

RE: Surrender of License

Dear Dr. Weiner and Members of the Board:

Please be advised that I have decided to surrender my license to practice in the State of Maryland. I hereby affirm that I am presently licensed to practice medicine in the State of Texas. The decision to surrender my license in the State of Maryland is REVOCABLE.

It is my understanding that this letter of surrender will be considered a public document upon my execution of the document, dated April 22, 1990.

I understand that, upon the surrender of my license to practice medicine in the State of Maryland, I may not give medical advice in Maryland to any individual, for compensation or otherwise, and may not prescribe medications. In other words, I understand that surrender of my Maryland license means that I am in the same position as an unlicensed individual in the State of Maryland.

My decision to discontinue the practice of medicine in the State of Maryland has been prompted by an investigation of my practice by the Maryland Board of Physician Quality Assurance (the Board). This investigation revealed the following:

1. That on September 4, 1987 I entered into a Memorandum of Agreement with the United States Department of Justice Drug Enforcement Administration, Docket 86-90, in which I agreed not to administer, dispense, prescribe, order, or otherwise handle any Schedule II, II N, III, III N, or IV controlled substances, or any Schedule V narcotic controlled substances for a period of five (5) years after the execution of the agreement;
2. That on October 29, 1988, I entered into an Agreed Board Order with the Texas State Board of Medical Examiners, and consented to abide by certain restrictions on my license to practice medicine in the State of Texas, among which were the following:

   a. Consenting that my license to practice medicine in the State of Texas be placed on probationary status until September 3, 1992;
   b. Remaining in compliance with the DEA

Agreement, docket 86-90, dated September 4, 1987; and

c. Enrolling in and completing a two (2) week preceptorship on the Prevention and Treatment of Drug Abuse.

On March 16, 1990 I received notice, through a telephone conversation with Robert J. Gilbert, Assistant Attorney General for the State of Maryland, of the Board's vote of January 25, 1989, to charge me under the Maryland Medical Practice Act (the Act), Md. Health Occ. Code Ann. §14-504(a)(10) and §14-504(a)(21).

Section 14-504(a) provides, in pertinent part:

> Subject to the hearing provisions of 14-505 of this subtitle, the Board, on the affirmative vote of a majority of its fully authorized membership, may reprimand any licenses, place any licensee on probation, or suspend or revoke a license if the licensee:
> (10) Promotes the sale of drugs, devices, appliances, or goods so as to exploit the patient for financial gain.
> (21) Is disciplined by a licensing or disciplinary authority or convicted or disciplined by a court of any state or country ... for an act that would be grounds for disciplinary action under this section.

I affirm that I have been advised by Mr. Gilbert that I have a right to legal counsel in the matters herein, and have, in fact, consulted with an attorney in this matter.

PHYSICIANS

29th Division Street , Baltimore, Md. 21201

Catch The Spirit
Maryland Army National Guard

My decision to surrender my Maryland license and to discontinue the practice of medicine in the State of Maryland has been prompted by my desire to avoid being charged under the Act, Title 14, Health Occupations Article of the *Annotated Code of Maryland*. The basis for charges against me would include the results of the investigation as described above.

I have not practiced medicine in Maryland since (never). I affirm that I do not have any hospital or office privileges in Maryland.

I affirm that I do not have a United States Drug Enforcement Administration Controlled Substances Registration Certificate for the State of Maryland. I affirm that I do not have a Maryland Controlled Dangerous Substances Registration Certificate issued by the Maryland Division of Drug Control. I affirm that I do not have any Drug Enforcement Administration order forms, or any Maryland prescription pads or order forms.

I am licensed to practice medicine in the State of Texas, license number D3864. I acknowledge that upon the execution of this document, the Board will send a copy of this Letter of Surrender to G.V. Brindley, Jr., MD, Executive Director, Texas State Board of Medical Examiners, P.O. Box 13562, Capitol Station, Austin, TX 78711.

I acknowledge that the Board will send a copy of this Letter of Surrender to the following:

1. Mr. Robert Bickel, Group Supervisor, Drug Enforcement Administration, 31 Hopkins Plaza, Room 955, Baltimore, MD 21201.
2. Mr. Charles Tregoe, Chief, Division of Drug Control, 4201 Patterson Ave. Baltimore, MD 21215.

I understand that the Board will acknowledge to the Federation of State Boards and to any individuals who have made a Public Information Act request to the Board that I have surrendered my license as resolution of the matters pending against me.

Before the Board accepts this Letter of Surrender as a resolution of this matter, I must present to the Board Maryland License D03201, including any renewal certificates and wallet-sized renewal cards.

Finally, I wish to make clear that I have consulted with an attorney before signing this letter SURRENDERING my license to practice medicine in Maryland. I understand both the nature of the charges against me and also this letter of surrender. I make this decision voluntarily and knowingly.

WILFREDO FERNANDEZ-VILA MD

Physicians' Quality Assurance Board Actions appear regularly in MMJ.

A tribute to *Edward J. Kowalewski MD* on the occasion of his retirement as Professor and Chairman of the Department of Family Medicine at the University of Maryland School of Medicine was held in late April in Baltimore.

Since his arrival on the Baltimore campus 18 years ago, Kowalewski has directed the growth of the department from its diminutive size of six residents to its present mature complement of thirty six. Graduates of the program have had significant impact on the availability of well-trained family physicians in the primary care arena of the American healthcare system.

Prior to his University experience, Kowalewski received good preparation via his many years of private practice and from his involvement at various levels of the Pennsylvania Academy of Family Physicians and the American Academy of Family Physicians, rising to serve as President of the latter just prior to his move to Baltimore and his redirection into full-time academic life.

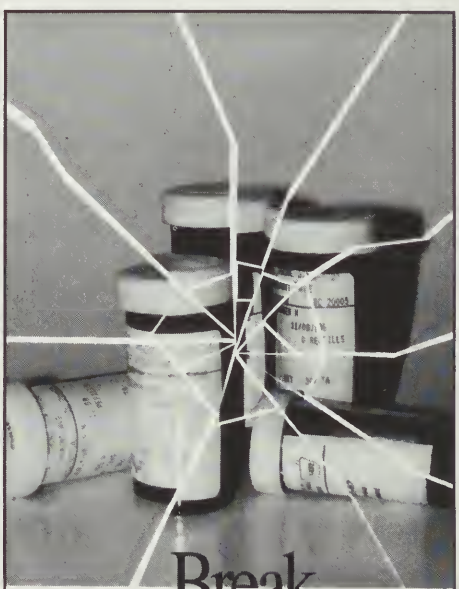
Physicians wanted for leading practice



Prestigious national group specializing in the treatment of venous disorders has exceptional opportunities in major metropolitan areas throughout the United States. We are in need of physicians trained in internal medicine, surgery or who have a broad based medical background to establish and direct a clinic as well as practice our state-of-the-art treatment techniques. We will provide complete training in the latest proprietary techniques of treating venous disorders. We offer an outstanding compensation package in the six figure area along with malpractice insurance and health benefits. Additionally, we offer a 40 hour work week, no weekend hours and freedom from beepers. You also won't have to worry about soliciting for patients or fighting insurance companies.

This is an outstanding opportunity for professional and financial advancement. If you are motivated to build a rewarding practice with the leader in the treatment of venous disorders, send your curriculum vitae to:

MISCELLANEOUS MEETINGS

September 14-16	**Medical and Chirurgical Faculty Semiannual Meeting**, Carousel Hotel and Resort, Oceanfront at 118th St., Ocean City, MD. Fee: Free for Med Chi members, students and residents; $150 nonmember physicians; $35 allied health professionals. 12 AMA Cat I credits. Info: Ralph Tyksinski, Director, Education and Meetings Management, Med Chi, 1211 Cathedral St., Baltimore, MD 21201 or call 301-539-0872 or 1-800-492-1056.
September 15	**Focus: Breast Cancer 1990 - Treatment and Reconstruction**, Maryland Chapter, American College of Surgeons and co-sponsor, The American Cancer Society, Maryland Division, Inc. 8 a.m. - noon, Sheraton Inner Harbor Hotel, Baltimore. No registration fee; 3 CME credits. Info: Program Chairman E.S. Epstein MD 301-542-4700.
September 20-21	**Second Annual Trauma Conference**, Carousel Hotel and Resort, Ocean City, MD. Sponsored by Peninsula General Hospital Medical Center. Fee: $100. Info: D. Kwiatkowski 301-543-7328.
October 6	**Modern Approach to Ventricular Arrythmias**, symposium sponsored by the Department of Medicine, Division of Cardiology, Harbor Hospital Center, Baltimore. AMA Cat I credits. Info: 301-347-3501.
October 12-13	**Fourteenth Annual Conference on Dyslexia**, Bryn Mawr College, Bryn Mawr, PA. Co-sponsored by the Greater Philadelphia Branch of the Orton Dyslexia Society and the Child Study Institute of Bryn Mawr College. Fee: $85 members of Orton Dyslexia Society; $115 nonmembers. Write for brochure: GPBODS, Box 251, Bryn Mawr, PA 19010; or call 215-527-1548.
October 20-21	**Practical Clinical Management: Drug Abuse Education for the Primary Care Physician,** Convention Center, Baltimore, MD. Fee: $75 Med Chi members; $100 nonmembers; $30 residents and students. 12 PRA/AMA Cat I credits. Info: Med Chi Drug Conference, 1211 Cathedral St., Baltimore, MD 21201-5585 or call 301-539-0872 or 1-800-492-1056.
October 25-27	**New Techniques and Concepts in Cardiology** Hyatt Regency Hotel, Washington DC. Sponsored by the American College of Cardiology. Info: Registration Secretary, Extramural Programs Department, American College of Cardiology, 9111 Old Georgetown Rd., Bethesda, MD 20814 (1-800-253-4636 or 301-897-5400, ext. 228).
October 29-31	**NIH Consensus Development Conference: Diagnosis and Management of Asymptomatic Primary Hyperparathyroidism,** Masur Auditorium, Warren Grant Magnuson Clinical Center, NIH, Bethesda. Info: Conference Registrar 301-468-MEET or FAX 301-770-5164.

Shady Grove Adventist Hospital, 9901 Medical Center Drive, Rockville, MD. Info: 301-279-6000.

September 6	**Update in Treatment of Liver Disease and Biliary Tract Disease**
September 13	**Nonsurgical Vascular Surgery: Laser Arteriectomy and Other Things**
September 27	**Management of the Overdose Patient**
October 4	**MRI and CT Update**
October 11	**Hyperbaric Oxygen Therapy**
October 18	**Seasonal Affective Disorders: A New Light on the Eye**
October 25	**Medical Malpractice: Legislative Update**

THE JOHNS HOPKINS MEDICAL INSTITUTIONS

All courses at the Turner Auditorium unless otherwise indicated. Sponsored Continued Education Activities for 1990. Info: Office of Continuing Education, 720 Rutland Ave., Turner Auditorium, Baltimore, MD 21205 (301-955-5880).

September 13-14

Pediatrics for the Practitioner - Update 1990. Fee: physicians $235; residents, retired physicians, & allied health professionals $160; 14.5 AMA Cat I credits. Info: J. Ryan 301-955-2959.

October 3-6

Sixteenth Annual Topics in Gastroenterology and Liver Disease, sponsored by The Harvey M. and Lyn P. Meyerhoff Digestive Disease and Inflammatory Bowel Disease Center and Department of Medicine. Fee: physicians $425, residents and fellows $210 (with letter from department chairperson verifying status); 23.5 AMA Cat I credits. Info: 301-955-2959.

October 22-27

Thirty-second Annual Emil Novak Memorial Course: Gynecology, Gynecological Pathology, Endocrinology, and High-Risk Obstetrics. Fee: physicians $650, residents $450 (with letter from department chairperson verifying status); 44.5 AMA Cat I credits. Info: C. Kearney 301-955-2959.

October 30-31

3D Neuroimaging: Theory and Clinical Applications, sponsored by the Department of Radiology and Radiological Sciences, The Johns Hopkins Medical Institutions. Fee: physicians $300, Johns Hopkins staff $200; 16.5 AMA Cat I credits. Info: F. Boling 301-955-2959.

November 1-4

Principles and Practice of MRI, at the Hyatt Regency Baltimore, sponsored by the Department of Radiology, Division of Magnetic Resonance Imaging, The Johns Hopkins Medical Institutions. Fee: physicians $495, residents and fellows $250; 24 AMA Cat I credits. Info: D. Heydinger 301-955-2959.

November 2-3

Progress in Pediatrics, sponsored by the Children's Medical and Surgical Center, The Johns Hopkins Medical Institutions. Fee: physicians $125, residents, fellows and nurse practitioners $75; 11 AMA Cat I credits, 11 PREP credits, other appropriate credit is pending. Info: P. Campbell 301-955-2959.

February-April 1991

Thirty-second Postgraduate Institute for Pathologists in Clinical Cytopathology for Board Certified (or qualified) pathologists as a subspecialty residency. 152 AMA Cat I credits in two courses, both of which must be taken.

February-April Home Study Course A, personal reading and microscopic study at own lab in preparation for Course B.

April 14-April 25 In-Residence Course B, lecture series, laboratory, and clinical experience at the Johns Hopkins Medical Institutions, Baltimore.

Course A materials will be sent to each participant within the US and Canada for home study. Participants *outside* the US and Canada must make arrangements to study Course A before Course B. *The entire course is given in English.*

Application and preregistration is advised ASAP; preregistration must be completed before March 15, 1991 unless by special arrangement. Info: J. Frost MD or B. Remley, 111 Pathology Building, The Johns Hopkins Hospital, Baltimore, MD 21205 USA (301-955-8594).

Continuously Throughout the Year

Ophthalmic Electrophysiology Technician Training Course (on-going 1-week course by appointment). The Wilmer Eye Institute, Baltimore. Info: C. Kearney.

The Department of Radiology and Radiological Sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams 301-955-3169.

Visiting Physicians - offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. Fee: $500; 40 AMA Cat I credits.

Johns Hopkins Medical Grand Rounds - Accredited audiovisual continuing education series of case discussion for clinicians; 30 topics/year in 5 bimonthly programs. Individual and group subscriptions; 40 AMA Cat I credits. Info: 301-955-3988.

Microsurgery Training at The Johns Hopkins Hospital, one week, offered continuously throughout the year. 40 AMA Cat I credits. Info: P. Williams 301-955-3169.

UNIVERSITY OF MARYLAND SCHOOL OF MEDICINE

CME Courses: For each course additional information may be obtained by contacting the Program of Continuing Education, University of Maryland School of Medicine, Room 14-011, BRB, 655 W. Baltimore St., Baltimore, MD 21201 (301-328-3956) or by calling the phone number listed under a specific program. FAX 301-328-3103.

August 23

Menopause: New Insights into Management, Stouffer Harborplace Hotel, Baltimore. Fee: $45; 4.5 AMA Cat I credits. Info: S. Stenhouse 301-328-1956.

September 14

Current Concepts in Ophthalmology: Tenth Annual Clinical Conference, Columbia Inn, Columbia. Includes the Fourth Annual Lois A. Young-Thomas Memorial Lecture. Fee: $60; 6 AMA Cat I credits.

October 1

Ocular Plastic Surgery: Current Concepts and Techniques, sponsored by Maryland Society of Eye Physicians and Surgeons; Columbia, MD. Info: T.S. Young 301-328-2399; FAX 301-328-8514.

October 6-7

Sixth Annual Contact Lens Symposium, Stouffer Harborplace Hotel, Baltimore. Fee: $165 before September 21; 12 AMA Cat I credits.

December 7-8

Cancer in Minorities, Stouffer Harborplace Hotel, Baltimore. Fee and credits to be determined. Info: S. Stenhouse 301-328-3956.

Continuously Throughout the Year

University of Maryland Dean's Conferences - Held monthly, October through April. Designed for the Family/General practitioner and Internist. Each conference highlights different clinical Departments placing emphasis on the practical methods being used and researched at the University of Maryland. Extension programs are planned to complement the programs held on the University's Baltimore campus.

Visiting Professor Program - Directory of speakers and topics available for area hospitals and other healthcare organizations. No administrative fee. Info: 301-328-3956.

Visiting Practitioner Preceptorships - Opportunity for physicians to participate in clinical situations in the University of Maryland Medical Systems. Requires approval from clinical department/division heads. Hour-for-hour Cat I credits available. Direct all inquiries to CME 301-328-3956.

Departmental Rounds and Conferences - Weekly, hands-on and lecture presentations hosted by the University's clinical departments. Hour-for-hour AMA Cat I credits available. Brochure available.

Advanced Trauma Life Support Provider/Instructor Programs sponsored by University of Maryland/MIEMSS. Info: M. Nelson 301-328-2919.

November 15-16 Provider
December 6-7 Provider

Morality and Sex: BPQA Decisions

Society expects its responsible members to adhere to certain minimal moral standards. The State of Maryland, therefore, has linked medical licensure to morality in two places in the Medical Practice Act.

To qualify for a medical license, Section 14-305 requires that the applicant be at least 18 years old, appropriately educated, competent in the English language, and "of good moral character." In addition, Section 14-504, which sets out the 30 grounds under which the Board of Physician Quality Assurance (BPQA) may reprimand, place on probation, suspend, or revoke a licensee, includes "(3) Is guilty of immoral or unprofessional conduct in the practice of medicine." Sexual misbehavior has long been considered an indication of immorality, and, regrettably, the Board sometimes must deal with such cases.

Societal standards of sexual conduct have become much more liberal in this century, and especially over the past two or three decades. Much sexual activity that even in recent years would have been considered as immoral is no longer generally considered to be so. Examples include premarital/extramarital sex and homosexual activities, which might well have been considered evidence of a deficiency in moral character in past years. These activities, in themselves, probably would not be considered immoral by the 1990 Board.

There are some sexual activities, however, that do remain beyond the limits of even today's liberalized morality. Rape (either forcible or statutory) or sexual child abuse almost would certainly be considered a valid basis for Board action. A recent child abuse case resulted in prompt Board action (the summary suspension of a physician's assistant certificate) even though the offensive acts did not take place in a professional setting.

Although the Board's attitude toward sex in general reflects the contemporary liberal view, when sex enters the practice of medicine by involving patients, the Board becomes much more conservative and intolerant. The basic premise of the Board's outlook is that, because of the special nature of the physician-patient relationship, patients cannot be considered to be freely consenting to a sexual relationship or act. The professional relationship always involves some degree of psychological dependency, and sex between physician and patient is always considered to be exploitative and manipulative on the part of the doctor. This viewpoint is, of course, neither new nor original; it is clearly enunciated in the Hippocratic Oath of ancient Greece. How severely the Board reacts to this kind of sexual activity depends, at least in part, to the specific facts of the professional relationship. The more psychologic dependency in a specific relationship and the more vulnerable the patient, the more egregious the physician's conduct will be considered. Thus, sex between psychiatrist and patient is the most flagrant violation of morality and, unfortunately, one of the most frequent.

One of the most outrageous cases in recent years came before the Commission on Medical Discipline, the predecessor to the present Board. It was that of a psychiatrist who prescribed sexual intercourse as therapy for his patient, administered the treatments, and then billed Blue Shield for the therapeutic sessions. His license was revoked.

Another Commission case, only slightly less flagrant, involved a psychiatrist who introduced his patient to hallucinogenic drugs and, under their influence, had intercourse with her on multiple occasions. He was suspended and allowed to resume practice only in a strictly supervised and controlled hospital setting.

The BPQA also has heard cases of "meaningful relationships" developing in the course of psychotherapy. The Board considers these to be most unprofessional; "true love" is not a valid defense. In such a recent case, the physician's license was suspended and eventually restored subject to restrictive probationary requirements. After the breakup of the affair, the patient initiated a malpractice action, which, as in most of these cases, was considered virtually indefensible and resulted in a substantial settlement payment. Should such a situation arise in the course of a therapeutic relationship, the proper conduct on the part of the physician is to terminate the treatment and arrange for transfer of the patient to the care of another doctor.

Not all sex cases involve psychiatrists. For example, a recent case involved a family practitioner, who had sexual affairs with multiple female patients over the course of several years. Despite evidence that he was a highly competent and dedicated physician, the Board revoked his license, allowing him the opportunity to reapply for restoration of the license no sooner than a year, at which time he had to bear the burden of proving he was worthy to resume the practice of medicine.

Sexual misconduct does not have to involve intercourse to be objectionable. Another Commission case was that of a gynecologist who was excessively affectionate with his patients. There were multiple complaints by women of erotic kissing and unencouraged sexual caresses and of embarrassing "dirty" comments. There was no possibility of misinterpretation because of the number of complaints. This doctor's license was suspended. Gynecologists surely should appreciate the necessity for sensitivity in dealing with the deeply personal nature of their specialty. Aberrant behavior can be most damaging to patients; one of the complainants has never been able to bring herself to have another gynecologic examination.

Sexual misconduct need not directly involve a patient to be considered "in the practice of medicine." Recent-

ly the BPQA was confronted with a case of a resident who allegedly went too far in consoling the wife of his critically ill patient. After discussing her husband's medical problem and trying to reassure her, he invited her to dinner; after dinner he escorted her to her motel room. There, sympathy led to intimate physical consolation. The wife, overcome by guilt, promptly confessed the incident to her husband, still a patient in the ICU. The Board considered these regrettable events to be "in the practice of medicine," and the physician escaped sanction only because he was not licensed and no longer in Maryland by the time the husband's complaint was received. The licensing board of the state in which he was then working was informed of the allegation.

In contrast, another case involving a patient and his wife resulted in no Board action. A surgeon had a long-standing sexual relationship with his secretary. During the course of this affair, her husband became a patient for a fairly routine surgical procedure, which was carried out uneventfully. Well after his recovery, the husband discovered the infidelity, and filed a complaint with the Board. The Board concluded that the affair did not affect him as a patient, and therefore did not occur "in the practice of medicine." It should be understood this decision does not constitute approval of or condone adultery but merely means the Board did not believe the conduct violated the statutory language of the law.

As students of human biology, physicians understand the strength and urgency of the sexual instinct, as do poets and novelists, and other observers of human behavior. Physicians, however must recognize their special place in society, the special franchise that being a doctor entails, and the special responsibilities that follow. Patients expect to be disrobed for examinations, to be touched in private places, and to discuss intimate details of their life and thoughts. They have a right to respect and consideration, and they have the right not to be viewed or treated as sexual objects by their physicians. When a patient enters into a physician-patient relationship, that very act is indicative of an implicit trust that must not be violated. Physicians must respect the clear and sharp boundary in their practice of medicine and should expect censure when that boundary is disregarded.

ISRAEL H. WEINER MD

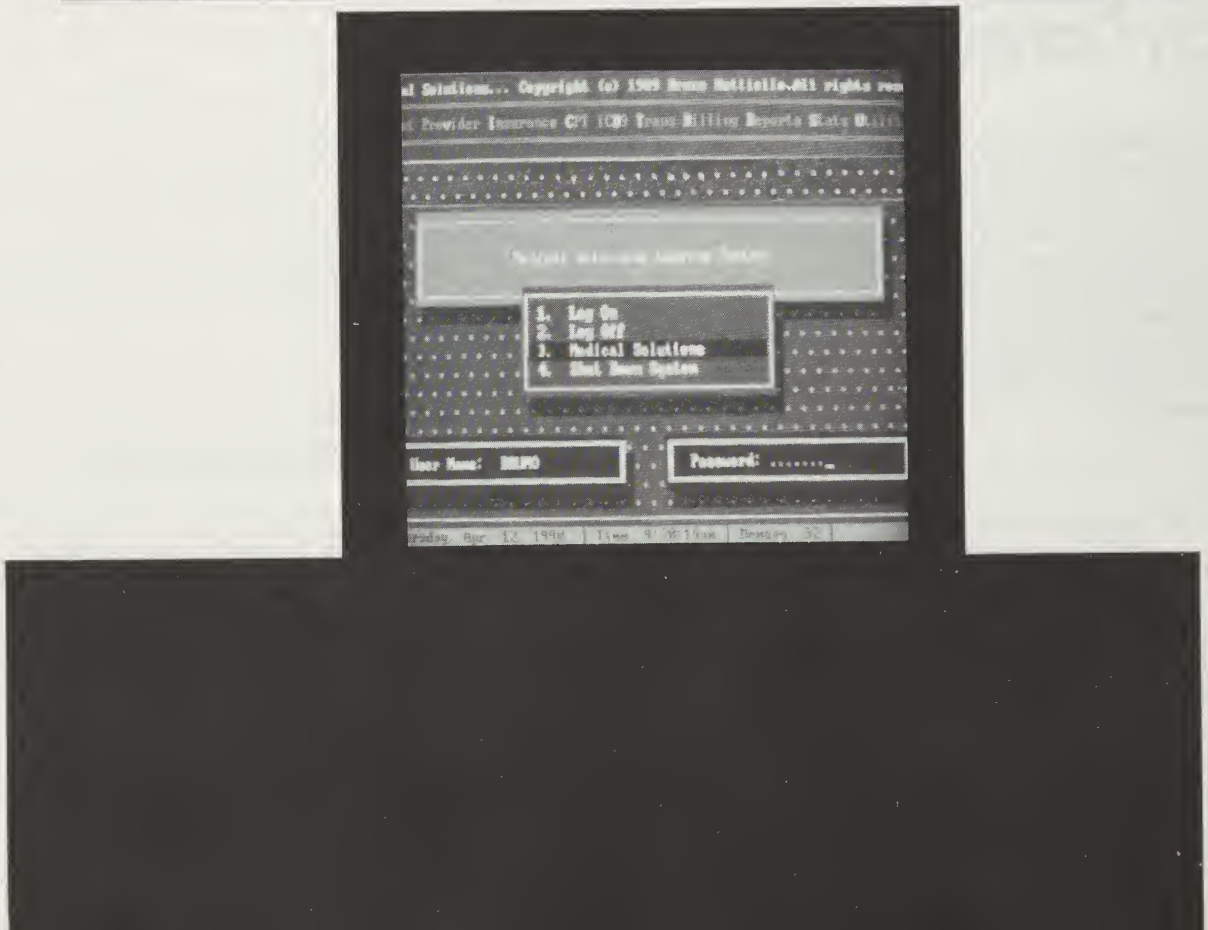
The opinions expressed herein are those of the author and have not been endorsed by the Board of Physician Quality Assurance, although the cases described reflect prior board actions. ■

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-in format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak



Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.
Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

Name _____ Address _____

Phone _____ Specialty _____

Return this form to: Betsy Newman, Med Chi, 1211 Cathedral Street, Baltimore, MD 21201.

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. Choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package designed and developed by the Computer Services Department at the Medical and Chirurgical Faculty of Maryland. Physicians were consulted at every stage of the applications development to insure an easy-to-use and well-designed system. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500-form billing, appointment scheduling, and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management offers:

- ☐ Appointment scheduler
- ☐ Aging
- ☐ Day sheets
- ☐ Menu driven system
- ☐ On-line help manual
- ☐ Maintainance of patient demographics
- ☐ Insurance billing (1500 form)
- ☐ Walk-out superbill
- ☐ End-of-month bill
- ☐ Statistical reports
- ☐ Accounting reports
- ☐ Unlimited technical support
- ☐ Unlimited software upgrades
- ☐ Unlimited office staff training
- ☐ Automatic back-up and restoration
- ☐ Separate ICD-9 and CPT code databases
- ☐ Multiple diagnosis and procedure transactions
- ☐ Password protection to sensitive areas
- ☐ No annual fee for Med Chi members
- ☐ Clinical demographics

MEDICAL MALPRACTICE DAZE

Quotes From Medical Mutual Liability*

"I think it's fair to say that the claims-made basis of underwriting was designed by its inventors to advantage themselves rather than their insureds. Why else do most insurers want to offer claims-made exclusively?"

February 17, 1982

"While initially the claims-made approach is less costly, as time progresses it becomes as expensive, or slightly more so, than occurrence basis coverage."

February 17, 1982

"There is no way to predetermine the full cost for claims-made coverage."

July 17, 1981

"First years premium afforded under claims-made...constitutes premium deferral, not a premium reduction."

October 7, 1981

"Your society has right along staunchly supported the underwriting of coverage on an occurrence basis. We continue to do so."

October 7, 1981

*All quotes taken from letters signed by Manning W. Alden, MD, as President of the Medical Mutual Liability Insurance Company of Maryland. Copies available for inspection upon request.

Patients must be enrolled before October 15, 1990.

The Patient Plus program for Calan SR 180 mg is available for all patients for a limited time only. As with other Searle cardiovascular products, Calan SR 180 mg will be available on an ongoing basis through the Patients In Need program. Please see your Searle Representative for full program details.

NEW 180 mg Calan® SR (verapamil HCl) 180mg

SUSTAINED-RELEASE CAPLETS

BRIEF SUMMARY

Contraindications: Severe LV dysfunction (see *Warnings*), hypotension (systolic pressure < 90 mm Hg) or cardiogenic shock, sick sinus syndrome (if no pacemaker is present), 2nd- or 3rd-degree AV block (if no pacemaker is present), atrial flutter/fibrillation with an accessory bypass tract (eg, WPW or LGL syndromes), hypersensitivity to verapamil.

Warnings: Verapamil should be avoided in patients with severe LV dysfunction (eg, ejection fraction < 30%) or moderate to severe symptoms of cardiac failure and in patients with any degree of ventricular dysfunction if they are receiving a beta-blocker. Control milder heart failure with optimum digitalization and/or diuretics before Calan SR is used. Verapamil may occasionally produce hypotension. Elevations of liver enzymes have been reported. Several cases have been demonstrated to be produced by verapamil. Periodic monitoring of liver function in patients on verapamil is prudent. Some patients with paroxysmal and/or chronic atrial flutter/fibrillation and an accessory AV pathway (eg, WPW or LGL syndromes) have developed an increased antegrade conduction across the accessory pathway bypassing the AV node, producing a very rapid ventricular response or ventricular fibrillation after receiving I.V. verapamil (or digitalis). Because of this risk, oral verapamil is contraindicated in such patients. AV block may occur (2nd- and 3rd-degree, 0.8%). Development of marked 1st-degree block or progression to 2nd- or 3rd-degree block requires reduction in dosage or, rarely, discontinuation and institution of appropriate therapy. Sinus bradycardia, 2nd-degree AV block, sinus arrest, pulmonary edema and/or severe hypotension were seen in some critically ill patients with hypertrophic cardiomyopathy who were treated with verapamil.

Precautions: Verapamil should be given cautiously to patients with impaired hepatic function (in severe dysfunction use about 30% of the normal dose) or impaired renal function, and patients should be monitored for abnormal prolongation of the PR interval or other signs of overdosage. Verapamil may decrease neuromuscular transmission in patients with Duchenne's muscular dystrophy and may prolong recovery from the neuromuscular blocking agent vecuronium. It may be necessary to decrease verapamil dosage in patients with attenuated neuromuscular transmission. Combined therapy with beta-adrenergic blockers and verapamil may result in additive negative effects on heart rate, atrioventricular conduction and/or cardiac contractility; there have been reports of excessive bradycardia and AV block, including complete heart block. The risks of such combined therapy may outweigh the benefits. The combination should be used only with caution and close monitoring. Decreased metoprolol clearance may occur with combined use. Chronic verapamil treatment can increase serum digoxin levels by 50% to 75% during the first week of therapy, which can result in digitalis toxicity. In patients with hepatic cirrhosis, verapamil may reduce total body clearance and extrarenal clearance of digitoxin. The digoxin dose should be reduced when verapamil is given, and the patient carefully monitored. Verapamil will usually have an additive effect in patients receiving blood-pressure-lowering agents. Disopyramide should not be given within 48 hours before or 24 hours after verapamil administration. Concomitant use of flecainide and verapamil may have additive effects on myocardial contractility, AV conduction, and repolarization. Combined verapamil and quinidine therapy in patients with hypertrophic cardiomyopathy should be avoided, since significant hypotension may result. Concomitant use of lithium and verapamil may result in a lowering of serum lithium levels or increased sensitivity to lithium. Patients receiving both drugs must be monitored carefully. Verapamil may increase carbamazepine concentrations during combined use. Rifampin may reduce verapamil bioavailability. Phenobarbital may increase verapamil clearance. Verapamil may increase serum levels of cyclosporin. Concomitant use of inhalation anesthetics and calcium antagonists needs careful titration to avoid excessive cardiovascular depression. Verapamil may potentiate the activity of neuromuscular blocking agents (curare-like and depolarizing); dosage reduction may be required. Adequate animal carcinogenicity studies have not been performed. One study in rats did not suggest a tumorigenic potential, and verapamil was not mutagenic in the Ames test. Pregnancy Category C. There are no adequate and well-controlled studies in pregnant women. This drug should be used during pregnancy, labor, and delivery only if clearly needed. Verapamil is excreted in breast milk; therefore, nursing should be discontinued during verapamil use.

Adverse Reactions: Constipation (7.3%), dizziness (3.3%), nausea (2.7%), hypotension (2.5%), headache (2.2%), edema (1.9%), CHF, pulmonary edema (1.8%), fatigue (1.7%), dyspnea (1.4%), bradycardia: HR < 50/min (1.4%), AV block: total 1°,2°,3° (1.2%), 2° and 3° (0.8%), rash (1.2%), flushing (0.6%), elevated liver enzymes. The following reactions, reported in 1.0% or less of patients, occurred under conditions where a causal relationship is uncertain: angina pectoris, atrioventricular dissociation, chest pain, claudication, myocardial infarction, palpitations, purpura (vasculitis), syncope, diarrhea, dry mouth, gastrointestinal distress, gingival hyperplasia, ecchymosis or bruising, cerebrovascular accident, confusion, equilibrium disorders, insomnia, muscle cramps, paresthesia, psychotic symptoms, shakiness, somnolence, arthralgia and rash, exanthema, hair loss, hyperkeratosis, macules, sweating, urticaria, Stevens-Johnson syndrome, erythema multiforme, blurred vision, gynecomastia, increased urination, spotty menstruation, impotence.

PHYSICIANS, THERE ARE TWO KINDS OF FLEXIBILITY IN THE ARMY RESERVE WE THINK YOU'LL LIKE.

One, time. We know how tough it is for a busy physician to make weekend time commitments. So we can offer the kind of flexible time scheduling that allows a physician to share sixteen hours a month with his or her country. We can arrange a schedule to suit your requirements.

Two, the opportunity to explore other phases of medicine, to add a different kind of knowledge—the challenge of military health care. It's a flexibility that could prove to be both stimulating and rewarding, with the opportunity to participate in a variety of programs that can put you in contact with medical leaders from all over the country.

See how flexible we can be; call our Army Medical Personnel Counselor:

Major Michael W. Salmons

The choices you make now may make all the difference later.

The decisions you make in a crisis will have a lasting impact on your patient's health. In the same way, the medical malpractice insurer you choose now may make all the difference to your professional and financial well-being in the years ahead.

When you choose Princeton, you're choosing a company with a solid track record. A company with years of experience providing professional liability insurance for physicians, and a history of successfully defending policyholders against meritless claims.

You're also choosing a company that's flexible enough to design policies that meet your individual coverage needs. Our innovative *Occurrence Plus* policy, for example, combines the best features of standard occurrence and claims-made and offers you the broadest insurance protection available.

And coverage is only half the story. Princeton has seasoned specialists working on your behalf -- so service is prompt and professional. Plus, our team of risk management consultants is ready to answer your questions, or arrange on-site educational programs.

Whether it's your patient's future, or your own, that's on the line, making the right choices is critical. Choose the insurer that offers experience, flexibility and service. Choose Princeton. Call your independent insurance agent today.

Endorsed by Med-Chi for Maryland Physicians

It's A Closed Box.

Simply put, your Medical Mutual premiums go into a closed box . . . and you own the box. We pay claims, we pay to defend physicians, we pay operating expenses. Any money left over belongs to you. That's it. No money goes to out-of-state owners, no money goes to subsidize operating expenses of a parent company located in another state. Dividends are paid to you, not to outside stockholders.

The physicians of Maryland planned it this way when you asked the Maryland General Asembly to create Medical Mutual to meet your special insurance needs. It's a concept that has worked well for over 15 years, and it's a concept that has made Medical Mutual the choice of the vast majority of physicians across the state.

The closed box. We're the only ones who operate this way. Why accept anything less?

Making the right choices means asking the right questions.

You know the questions to ask your patients. Questions that will provide the information you need to make an informed decision about medical treatment.

When it comes to choosing a medical malpractice insurer, knowing which questions to ask--and how to interpret the answers--is no less important. Because just as your treatment decisions may have a lasting impact on your patient's long-term health, your choice of insurer may make all the difference to your professional and financial well-being in the years ahead.

In an uncertain medical situation, you might consult a specialist. When you're making decisions about insurance, why not consult with an insurance specialist? An expert who can suggest which questions to ask, guide you through the technical jargon, and help you select the coverage that's right for you.

That's where Princeton's network of independent insurance agents comes in. Our agents understand the insurance needs of health care professionals. They'll show you how to compare costs and benefits, and help you avoid gaps or duplications in coverage.

Do ask an agent why Princeton should be your choice. Ask about our financial strength, about our claims management philosophy that vigorously defends physicians against meritless claims...and about our new office package policy that offers protection for your practice and premises. We think you'll like the answers.

Greater Baltimore Medical Center: 25 Years of Medical Leadership 919
L. Myrton Gaines, Jr. MD

Current Concepts in Olfaction 921
Mark C. Loury MD
Because of the location of the olfactory epithelium and bulb, the processes involved in olfaction have been difficult to evaluate. However, the recent application of comprehensive nasal endoscopy, reproducible olfactory testing, and molecular biologic techniques to the study of the transduction of olfactory information has elucidated some of the events in odorant perception.

The In Vitro Fertilization Program at the Greater Baltimore Medical Center 927
Jairo E. Garcia MD
During its six years of existence, GBMC's IVF program has achieved a 23 percent "take home baby" rate per cycle with embryo transfer.

Pathogenic Factors in the Development of Type I and Type II Diabetes Mellitus: 1990 933
Thaddeus E. Prout MD, FACP
The pathogenesis of IDDM and NIDDM indicates a distinct difference between these diseases. Viral illness is implicated in IDDM, linked with evidence for an immune deficiency. NIDDM is not linked to viral illness or autoimmunity but is highly influenced by the inheritance of a defect in insulin production.

Parvovirus and Epidemic Arthritis 939
Charles A. Haile MD
Five cases of acute polyarthritis in individuals with serologic evidence of recent human parvovirus B_{19} infection were seen in one medical practice. Several individuals had had direct exposure to children with rash, and fifth disease was endemic in the community. All cases were associated with the presence of both IgG and IgM antibody to human parvovirus.

Cervical Spondylosis: A Therapeutic Update 947
Kenneth J. Murray MD, PhD; Albert H. Dudley, III MD and Howard Moses MD
Cervical spondylosis, also known as cervical osteoarthritis, is a common spine condition whereupon bone spur formation occurs.

Role of the Community Hospital in Cancer Research 953
Gary I. Cohen MD and Margaret Tillett RN, OCN
We review here the historical development, rationale, and advantages of community hospital participation in controlled clinical trials, the primary source of reliable advances in the management of patients with cancer.

Definitive Irradiation Following Breast-Conserving Surgery for Early Stage Breast Cancer 959
Robert K. Brookland MD and Albert L. Blumberg MD
Definitive irradiation following breast-conserving surgery for early stage breast cancer can be offered in a community cancer center and achieve excellent local control, survival, and cosmesis. The results confirm the validity of patient choice in selecting this breast-conserving modality as an alternative to mastectomy for selected patients with stage I and II breast cancer.

Ann Wintriss retired at the end of July after completing eight and a half years as the Managing Editor of the *Maryland Medical Journal*. She was instrumental in many of the layout and design changes that enhance the journal's readability. During her tenure, the journal's name reverted to the title used from 1877-1918; a new logo provided the cover with a dramatic facelift. To recognize the improving quality of scientific articles being submitted to the *MMJ,* annual awards were established in 1987 for best article by a practitioner and best article by a resident-in-training. To meet the needs of *MMJ*'s readers, a number of new Departments (for example, Today's Psychiatry, Computer Bytes, Quality Practice Digest) were created, as well as the concept of "dedicated" issues. Ms. Wintriss served Med Chi well, and her dedication and expertise will be missed.

Cover: The Greater Baltimore Medical Center's diverse services and advancements in technology and patient care are outlined in this issue's articles. Mary Kerney RN and Terry MacLeod RN use heart monitors in 1974 (inset) and 1990, illustrating the technological changes which have taken place.

Cover color photo by John Dean; design by Virginia Carter.

MALPRACTICE INSURANCE

It pays to review the alternatives

Do you know the answers to these questions?	Yes	No
*Do all carriers have the same success rate defending claims?	☐	☑
*Do all carriers have the same philosophy towards settling unjustified claims for their nuisance value?	☐	☑
*Are any carriers required to renew policies regardless of claims history?	☐	☑
*Do all carriers offer only claims made coverage?	☐	☑
*At retirement, do all carriers provide the same level of protection for the physician's lifetime?	☐	☑
*Do all carriers provide their physicians with the same quality of service?	☐	☑
*Are the premiums of all carriers pretty much the same?	☐	☑

No two carriers are alike. There are excellent alternatives available to all Maryland physicians. It is not too soon to begin a review of your malpractice policy. Contemporary Insurance Services is an independent agency that can advise you concerning all malpractice carriers. We serve hundreds of Maryland physicians and are committed to providing the best coverage at the best price. Don't buy blind. It pays to review the alternatives.

Return the form below for policy comparisons or call to arrange for an appointment at your convenience. **You need a broker you can rely on!**

Intraductal Carcinoma of the Breast (IDC)

With the availability of new and more sophisticated mammographic equipment, early breast lesions are being detected more often. Intraductal cancer (IDC) is usually being diagnosed as a cluster of microcalcifications and occasionally as abnormal shadows. The recent demonstration that segmental (partial) mastectomy and axillary nodal dissection have produced comparable results to modified radical mastectomy in the management of patients with infiltrating ductal carcinomas makes the evaluation of conservative treatment for IDC a compelling issue. The continued use of mastectomy for such noninvasive cancer is coming under greater challenge as the standard treatment for invasive cancers has shifted toward the use of breast preservation operations. Those who advocate mastectomy for IDC are finding themselves in the difficult position of selecting a prophylactic therapy that is more severe than the treatment of the disease they are attempting to prevent.

A review of the data describing the natural history of IDC demonstrates serious deficiencies because the standard treatment of this disease had been mastectomy. Therefore, there was no opportunity for an evaluation of the behavioral characteristics of IDC. The few available studies in which IDC patients are being treated by local incisions are derived from retrospective anecdotal case reviews. The property of IDC having the most important therapeutic relevance is the incidence of subsequent development of invasive ductal carcinoma following local excisions. Three retrospective studies (which suffer from small sample sizes ranging from 15-25 patients) with the mean follow-up time varying from 15-22 years, revealed that one-quarter to one-half of the patients who were diagnosed with IDC and had been treated by biopsy only, will presumably go on to develop infiltrating cancer.[1-3] The mean interval time between the diagnosis of IDC and the development of infiltrating ductal carcinoma is about 10 years. Although this disease has a greater than 50 percent reported incidence of ipsilateral multicentricity, virtually all the invasive cancers occur not only in the same breast, but in the same quadrant as that of the initial biopsy.[2,3] On the other hand, the review of 27 patients with IDC, who were studied by the National Surgical Adjuvant Breast and Bowel Project (NSABP), revealed that there was almost no incidence of multicentric disease. It seems that the older studies[1-3] have failed to differentiate multicentricity from multifocality and residual noninvasive tumors in the same breast.

It has also been reported that 5-20 percent of the patients with IDC have residual foci of invasive carcinoma on closer histological examination. However, when IDC criteria were rigidly applied, this figure was found to be closer to 5 percent.[4] It has also been reported that 1-5 percent of IDC patients have metastases to their axillary lymph nodes. The retrospective nature and methodologic weaknesses of these studies make it difficult to draw firm conclusions relative to the behavior of this disease. However, none of the first 300 patients who were entered on NSABP Protocol B-17 and who were treated by partial mastectomy and axillary dissection were found to have involved axillary lymph nodes. Therefore, Protocol B-17 was amended to surgically manage IDC patients by partial mastectomy without axillary lymph node dissection.

Furthermore, the early results from several recent studies had suggested that radiation therapy administered after partial mastectomy may reduce the incidence of recurrence. However, none of these studies were randomized to prove the value of irradiation, and each had a small number of patients. On the other hand, the NSABP had over 450 patients admitted to Protocol B-17 who were managed by partial mastectomy with or without breast irradiation. When the results of this study become available, it will prove or disprove the value of radiation therapy, and will reveal the incidence of recurrences which may reflect on the incidence of multicentricity in this disease. This study is still open for patient accrual and every effort should be made to admit IDC patients on it.

October 1990
Influenza: Review, and Questions and Answers
and
Updates on Pneumococcal Vaccine and Salmonella enteritidis

1989-1990 Influenza Season

In Maryland during the 1989-1990 influenza season, only Influenza A/Shanghai/H3N2 was isolated from specimens submitted from individual cases and from nursing home outbreaks.

The figure below shows the epidemic curve of the 57 nursing home outbreaks of respiratory illness reported between November, 1989 and April, 1990. Influenza A was isolated in six of the outbreaks, and parainfluenza I and III in two each. The etioiogic agent causing the outbreaks in the other nursing homes was unknown, but the majority were presumed to be influenza outbreaks.

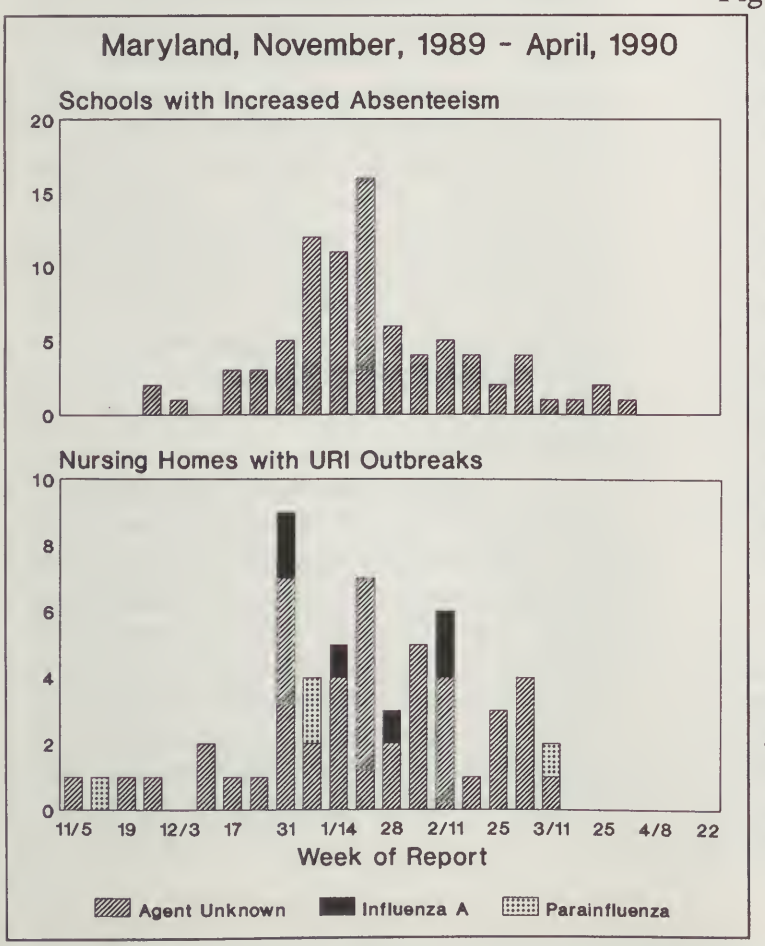

Figure 1 also shows the number of schools reporting increased school absenteeism over the same period. Both nursing home outbreaks and school absenteeism peaked in January.

For control of nursing home outbreaks, both influenza vaccine and amantadine (for influenza A) are recommended; however, we have found that both are underutilized. Vaccine is often given in the fall of the year. Admissions after that time may not be given their shot. Also employees may not be offered vaccine. Fear of side effects and inability to contact all physicians to order amantadine often limit its use.

Questions and Answers on Influenza

The following information is offered in response to common questions about influenza. It is adapted fromThe Texas Preventable Disease News, and includes updated information from "Prevention and Control of Influenza," MMWR 1990:39(no.RR-7).

Q. What is influenza?

A. Influenza, or "flu", is a respiratory disease caused by a virus. There are two main types of influenza virus -- A and B. Each type includes many related viruses or strains, each slightly different from the others. Type A epidemics are generally more frequent and more severe than those of type B.

Q. How serious a disease is influenza?

A. Influenza illnesses range from very mild to severe, depending upon such factors as the individual's susceptibility and general physical condition. Influenza seldom lasts more than a few days. Most people recover within a week without complications, although they may continue to feel weak for several days after the fever subsides. Influenza can, however, last longer and cause life threatening complications in high risk individuals or, rarely, in normally healthy individuals.

Q. Why are some people referred to as "high risk"?

A. The risk of developing severe complications with influenza increases with age (particularly among those cases 65 years of age or older) or in individuals (of any age) with chronic medical conditions. A healthy young person who contracts pneumonia following influenza has a far better chance for survival than an elderly or debilitated person. The chronic conditions which present the greatest risk for serious complications or death from influenza are problems such as diabetes, diseases of the heart, lungs, or kidneys, severe anemia, or chronic illnesses (or medications) which lower the body's resistance to infection.

Q. How is influenza spread?

A. Influenza spreads from person to person through droplets of moisture expelled into the air when a person with influenza sneezes, coughs, or talks. These droplets contain viruses which, when inhaled by other people, can cause infection in those who are susceptible. The incubation period for influenza (the length of time between a person's exposure to disease and actual development of symptoms) typically ranges from 1-3 days.

It has also been shown that influenza spreads very rapidly over great geographic distances. An epidemic of influenza commonly lasts one to two months in any one locality (city/county).

Q. How is influenza diagnosed and treated?

A. Usually, the diagnosis is based on the appearance of "classic" flu symptoms which include fever, chills, headache, cough, and sore and aching muscles in the back, arms, and legs. Confirmation of the diagnosis by laboratory tests is seldom warranted. Such tests are costly and time-consuming, and the patient will usually recover before the results are available. For public health reasons, they are useful to determine the type(s) of influenza virus circulating.

There is no specific treatment, but bed rest, drinking more than usual amount of liquids, and taking pain relievers help reduce the discomfort of the illness.

Aspirin, however, should **not** be given to children or adolescents because of the risk of Reye syndrome. Because influenza is a viral illness, antibiotics are of no use except treating bacterial complications such as pneumonia. One drug, amantadine hydrochloride (see below), has been licensed for use and may prevent illness, if given prophylactically, or reduce the severity or duration of illness when given early after infection with type A influenza viruses. Amantadine is not effective against type B influenza.

Q. Are there other diseases whose symptoms can be confused with those of influenza?

A. Yes, severe colds and many other nasal or bronchial infections have symptoms similar to influenza -- fever, headache, cough, etc. Such infections with non-influenza viruses are particularly common in young children and occur sporadically in adults, who normally have a "true" influenza infection only once every several years.

A diagnosis of influenza is more likely to be correct when an epidemic is in progress.

What some people call "intestinal flu" (nausea, cramps, vomiting, diarrhea) is not flu at all, but an intestinal infection caused by viruses other than influenza. Influenza does not generally cause intestinal problems.

Q. Every year there seems to be a new influenza virus going around. Why?

A. The influenza viruses frequently change; thus from time to time, new strains of influenza virus appear. Epidemics then occur because people have not had previous exposure which would allow them to build up specific immunity (protection) against the new strain.

Q. How are influenza strains named?

A. Strains of influenza viruses are usually named for the locality in which they are first isolated and reported. The virus strain called "Taiwan" influenza (A/Taiwan/86) is a type A influenza virus first reported from Taiwan in 1986, hence its name.

Q. What kind of vaccine is available for the 1990-91 season?

A. Influenza vaccinations should be given annually. A trivalent (three strains), "killed virus" vaccine containing A/Taiwan (H1N1), A/Shanghai (H3N2), and B/Yamagata has been produced for use in 1990-91. Persons 9 years of age and older will require only one dose. For maximum effectiveness, children under 9 will require two doses of "split virus" vaccine about 1 month apart, unless they received influenza vaccine previously (in which case only one current dose is needed).

Q. Who should receive influenza vaccine?

A. To maximize protection of those at high risk of developing complications from influenza, both the persons at risk and their close contacts should be vaccinated. This includes (but is not limited to):

* Persons aged 65 years and older;
* Residents of nursing homes and other chronic-care facilities housing persons of any age with chronic medical conditions;
* Adults and children with chronic disorders, especially pulmonary and cardiovascular disorders, including children with asthma;
* Adults and children who have required regular medical follow-up or hospitalization during the preceding year because of metabolic or renal disease, hemoglobinopathies or immunosuppression (including HIV infection);
* Children and teenagers receiving long-term aspirin therapy;
* Those providing care to high-risk individuals, including health care givers; and
* Household members of high-risk persons.

Q. How safe is the influenza vaccine?

A. Vaccines used in recent years have been associated with only a few reactions. Inactivated influenza vaccine should not be given to persons known to have anaphylactic hypersensitivity to eggs. Some people may have a sore arm for 1 or 2 days. Others may have fever, chills, headache, or muscle aches within the first 48 hours after vaccination. However, it is important to remember that you cannot get infectious influenza from this vaccine.

The vaccine is safe for pregnant women, and such women should be vaccinated if they belong to any of the high-risk groups. Delaying administration of the vaccine until after the first trimester is a reasonable precaution to minimize any concern over the theoretical risk of effects on the fetus unless the woman at risk will be in the first trimester when the influenza season begins.

Q. Is there any other way to prevent influenza other than vaccination?

A. Yes, amantadine hydrochloride may help to prevent type A influenza in certain high-risk persons or their caregivers who need protection during an influenza outbreak. Contingency plans are needed to ensure rapid administration of amantadine to residents and employees of institutions during an outbreak. The patient's age, weight, renal function, presence of other medical conditions, and indications for use of amantadine must be considered, and the dosage and duration of treatment adjusted accordingly (see package insert).

PNEUMOCOCCAL VACCINE: STILL UNDERUTILIZED

Pneumococcal vaccine* remains underutilized, leading to increased hospitalizations, morbidity and mortality from pneumococcal disease. In 1985, < 10% of persons considered to be at increased risk of serious infection were estimated to have ever received pneumococcal vaccine. The vaccine is safe, effective (60-77% vaccine efficacy), and inexpensive. Medicare now covers the cost of the vaccine and its administration. Since 1983, each 0.5 mL dose has contained purified capsular polysaccharide antigens of 23 types of *Streptococcus pneumoniae* (25ug each). In healthy adults, antibody titers remain elevated for at least 5 years after immunization.

Vaccine is indicated for:

* Adults who are at increased risk of pneumococcal disease or its complications because of cardiovascular disease, pulmonary disease, diabetes, alcoholism, cirrhosis, or CSF leaks.
* Adults who are $\geq$ 65 years old.
* Immunocompromised adults at increased risk of pneumococcal disease or its complications (e.g., persons with splenic dysfunction, Hodgkin's disease, lymphoma, multiple myeloma, chronic renal failure, nephrotic syndrome, or organ transplant).
* Adults with asymptomatic or symptomatic HIV infection.
* Children $\geq$ 2 years old with chronic illnesses associated with increased risk.
* Children $\geq$ 2 years old with asymptomatic or symptomatic HIV infection.

Revaccination:

Revaccination with 23-valent vaccine should be strongly considered for persons who received the 14-valent vaccine if they are at highest risk of fatal pneumococcal infection. Revaccination should also be considered for adults at highest risk who received the 23-valent vaccine $\geq$ 6 years before, and for those shown to have rapid decline in pneumococcal antibody levels (nephrotic syndrome, renal failure, or transplant recipients). Revaccination after 3-5 years should be considered for children with nephrotic syndrome, asplenia, or sickle cell anemia who would be $\leq$ 10 years old at revaccination.

UPDATE: SALMONELLA ENTERITIDIS AND EGGS

During 1990, 8 outbreaks of salmonellosis have been reported to the Maryland Department of Health and Mental Hygiene, Division of Outbreak Investigation. Of the 8 outbreaks, 7 have been caused by *Salmonella enteritidis* (group D) and one by *S. heidelberg*. The incidence of *S. enteritidis* outbreaks remains high in Maryland, although the number of cases in each outbreak has declined since 1989, when several large restaurant-associated outbreaks were reported. We continue to find eggs or egg-containing vehicles in many of the outbreaks.

Federal Regulations were adopted by the US Department of Agriculture in February, 1990. The regulations deal with the expanding problem of *S. enteritidis* associated with eggs. The regulations cover the identification of layer flocks associated with outbreaks, the testing of the environment of these flocks, and testing of birds if the environment if found positive. If the hens are positive for *S. enteritidis*, the regulations allow restriction of interstate movement of the chickens, eggs, and associated articles from the egg production flock. Eggs from the flock must go to pasteurization, if they are to be sold.

We would like to remind physicians to report cases of salmonellosis and suspected or confirmed outbreaks. Procedures are in place for case and outbreak investigation. Prompt reporting facilitates the process of egg traceback and testing of farms and hens in those egg-associated outbreaks.

MED-CHI'S EXCLUSIVE MOBILE PHONE DEALER!

One Call Does It All.

Every A.T.C. Cellular phone comes loaded with service. From selection to activation, A.T.C. does it ALL!

ATC Cellular Phones:

- Purchase or lease • Number assignment
- All Cellular accessories • Hands-free

ATC Service:

- Complete installation service at A.T.C. or at your home/office
- Full de-install/re-install service at discount prices
- Full service for every Cellular need

A.T.C. is your center for Cellular Telephones and Accessories, Car Alarms, Car Radios, Pagers, Radar Detectors, Voice Mail.

THERAPY THAT MAY BE AS SILENT AS HYPERTENSION ITSELF

VASOTEC is generally well tolerated and not characterized by certain undesirable effects associated with selected agents in other antihypertensive classes.

VASOTEC is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

A diminished antihypertensive effect toward the end of the dosing interval can occur in some patients.

For a Brief Summary of Prescribing Information, please see the last page of this advertisement.

FOR MANY HYPERTENSIVE PATIENTS

ONCE-A-DAY

VASOTEC®

(ENALAPRIL MALEATE | MSD)

Copyright © 1990 by Merck & Co., Inc.

VASOTEC®
(ENALAPRIL MALEATE | MSD)

VASOTEC is available in 2.5-mg, 5-mg, 10-mg, and 20-mg tablet strengths.

Contraindications: VASOTEC® (Enalapril Maleate, MSD) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the face, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASOTEC. In such cases, VASOTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See ADVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Patients with heart failure given VASOTEC commonly have some reduction in blood pressure, especially with the first dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are followed; caution should be observed when initiating therapy. (See DOSAGE AND ADMINISTRATION.) Patients at risk for excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion of any etiology. It may be advisable to eliminate the diuretic (except in patients with heart failure), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASOTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIONS, *Drug Interactions* and ADVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive tall in blood pressure could result in a myocardial infarction or cerebrovascular accident. If excessive hypotension occurs, the patient should be placed in the supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses ot VASOTEC, which usually can be given without difficulty once the blood pressure has stabilized. If symptomatic hypotension develops, a dose reduction or discontinuation of VASOTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more trequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the first tew weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASOTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of the diuretic and/or VASOTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See DOSAGE AND ADMINISTRATION.)

Hyperkalemia: Elevated serum potassium (>5.7 mEq/L) was observed in approximately 1% ot hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause ot discontinuation of therapy in 0.28% of hypertensive patients. In clinical trials in heart failure, hyperkalemia was observed in 3.8% ot patients, but was not a cause tor discontinuation.

Risk tactors for the development ot hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with VASOTEC. (See *Drug Interactions.*)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially tollowing the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling ot face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness, especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a tall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication ot infection (e.g., sore throat, fever) which may be a sign of neutropenia.

NOTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation ot treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision after the initial dose for at least two hours and until blood pressure has stabilized tor at least an additional hour. (See WARNINGS and DOSAGE AND ADMINISTRATION.)

Agents Causing Renin Release: The antihypertensive effect ot VASOTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because ot demonstrated hypokalemia, they should be used with caution and with frequent monitoring ot serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: Lithium toxicity has been reported in patients receiving lithium concomitantly with drugs which cause elimination of sodium, including ACE inhibitors. A few cases of lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation of both drugs. It is recommended that serum lithium levels be monitored frequently if enalapril is administered concomitantly with lithium.

Pregnancy – Category C: There was no fetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average fetal weight, occurred in rats given 1200 mg/kg/day of enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and fetal toxicity occurred in some rabbits at doses of 1 mg/kg/day or more. Saline supplementation prevented the maternal and fetal toxicity seen at doses ot 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies of enalapril in pregnant women. However, data are available that show enalapril crosses the human placenta. Because the risk of fetal toxicity with the use of ACE inhibitors has not been clearly detined, VASOTEC® (Enalapril Maleate, MSD) should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Postmarketing experience with all ACE inhibitors thus far suggests the following with regard to pregnancy outcome. Inadvertent exposure limited to the first trimester of pregnancy has not been reported to affect fetal outcome adversely. Fetal exposure during the second and third trimesters of pregnancy has been associated with fetal and neonatal morbidity and mortality.

When ACE inhibitors are used during the later stages of pregnancy, there have been reports of hypotension and decreased renal perfusion in the newborn. Oligohydramnios in the mother has also been reported, presumably representing decreased renal function in the fetus. Infants exposed *in utero* to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion with the administration of fluids and pressors as appropriate. Problems associated with prematurity such as patent ductus arteriosus have occurred in association with maternal use of ACE inhibitors, but it is not clear whether they are related to ACE inhibition, maternal hypertension, or the underlying prematurity.

Nursing Mothers: Milk in lactating rats contains radioactivity following administration ot ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Safety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for safety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASOTEC has been found to be generally well tolerated in controlled clinical trials involving 2987 patients.

HYPERTENSION: The most frequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

HEART FAILURE: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (7.9%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% of patients treated with VASOTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial infarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% of patients with hypertension or heart failure in clinical trials in order of decreasing severity within each category:

Cardiovascular: Cardiac arrest; myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); pulmonary embolism and infarction; pulmonary edema; rhythm disturbances; atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis (hepatocellular or cholestatic jaundice), melena, anorexia, dyspepsia, constipation, glossitis, stomatitis, dry mouth.

Musculoskeletal: Muscle cramps.

Nervous/Psychiatric: Depression, confusion, ataxia, somnolence, insomnia, nervousness, paresthesia.

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIONS and DOSAGE AND ADMINISTRATION).

Respiratory: Bronchospasm, rhinorrhea, sore throat and hoarseness, asthma, upper respiratory infection.

Skin: Exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, herpes zoster, erythema multiforme, urticaria, pruritus, alopecia, flushing, hyperhidrosis.

Special Senses: Blurred vision, taste alteration, anosmia, tinnitus, conjunctivitis, dry eyes, tearing.

A symptom complex has been reported which may include a positive ANA, an elevated erythrocyte sedimentation rate, arthralgias/arthritis, myalgias, fever, serositis, vasculitis, leukocytosis, eosinophilia, photosensitivity, rash, and other dermatologic manifestations.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASOTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause for discontinuation ot therapy in 0.1% ot hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause for discontinuation ot therapy in 1.9% ot patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASOTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIONS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation of VASOTEC and/or other concomitant diuretic therapy, were observed in about 11% of patients. Increases in blood urea nitrogen or creatinine were a cause for discontinuation in 1.2% of patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g% and 1.0 vol %, respectively) occur frequently in either hypertension or heart failure patients treated with VASOTEC but are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1% of patients discontinued therapy due to anemia.

Other (Causal Relationship Unknown): In marketing experience, rare cases of neutropenia, thrombocytopenia, and bone marrow depression have been reported. A tew cases ot hemolysis have been reported in patients with G6PD deficiency.

Liver Function Tests: Elevations of liver enzymes and/or serum bilirubin have occurred.

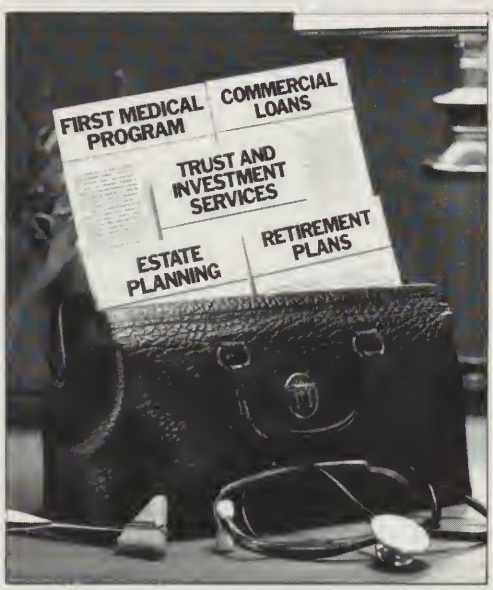
Dosage and Administration: *Hypertension:* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, it possible, be discontinued for two to three days before beginning therapy with VASOTEC to reduce the likelihood of hypotension. (See WARNINGS.) It the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

It the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Dosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. If blood pressure is not controlled with VASOTEC alone, a diuretic may be added.

Concomitant administration of VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases of serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose of enalapril is recommended tor patients with a creatinine clearance > 30 mL/min (serum creatinine of up to approximately 3 mg/dL). For patients with creatinine clearance ≤ 30 mL/min (serum creatinine ≥ 3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum of 40 mg daily.



Heart Failure: VASOTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starting dose is 2.5 mg once or twice daily. After the initial dose of VASOTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*) If possible, the dose of the diuretic should be reduced, which may diminish the likelihood of hypotension. The appearance ot hypotension after the initial dose of VASOTEC does not preclude subsequent careful dose titration with the drug, following effective management of the hypotension. The usual therapeutic dosing range for the treatment of heart failure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced mortality in patients with severe heart failure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day of VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACOLOGY, *Pharmacodynamics and Clinical Effects.*) Dosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)

Dosage Adjustment in Patients with Heart Failure and Renal Impairment or Hyponatremia: In patients with heart failure who have hyponatremia (serum sodium < 130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See DOSAGE AND ADMINISTRATION, *Heart Failure,* WARNINGS, and PRECAUTIONS, *Drug Interactions.*) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of four days or more, it at the time of dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.

For more detailed information, consult your MSD Representative or see Prescribing Information, Merck Sharp & Dohme, Division of Merck & Co., Inc., West Point, PA 19486. J9VS61R2(820)

MSD
MERCK SHARP & DOHME

We provide "proper treatment" for every physician.

At First National Bank of Maryland, we know that time is extremely valuable to a physician. That's why we have made a major commitment to take care of **all** your financial needs with speed... accuracy... and a high level of personal service.

As part of our First Medical Program, we offer you a comprehensive package of customized services designed to satisfy your professional... and personal... financial requirements. Plus an experienced business banker who will work closely with you at your home or office.

To arrange for a confidential consultation, contact the First National Bank of Maryland office nearest you today. You'll find out we give you the treatment you deserve.

Exceeding the Expected.

Listen to your peers. They tell us

THE MEDICAL MANAGER® Is Peerless!

For years we've been telling you that The Medical Manager® from PRISM Medical Systems is the best software for your medical practice. Now it's time for some of our users, physicians and office managers, to tell you.

"We have found that PRISM understands medical office function better than other vendors we spoke to. PRISM best met our needs with hardware and software and training. I really appreciate being able to call and talk about our problems, no matter how simple or complex."

–Northern Virginia Pulmonary Associates

PRISM Medical Systems is the largest dealer of The Medical Manager® in the Mid-Atlantic states. Users agree that this medical practice management software package streamlines office organization and improves collections. With more than 8,000 systems installed nationwide, The Medical Manager® surpasses its competition. Satisfied users agree.

"We felt that the increased flexibility and versatility of The Medical Manager® would provide us with a system that would grow along with us and adapt to the demands of our practice. No other system we looked at was able to monitor the multiple and changing components of our practice as effectively and detailed as The Medical Manager.® The enhanced scheduling program will be a life saver for us, with our complex assortment of patients and practitioners."

–Scandia Centrum

For more information about The Medical Manager® contact your nearest PRISM office or call us toll free.

Executive Director's Newsletter

October 1990

Complimentary October Drug Conference

Med Chi is offering complimentary registration to physicians for the conference "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician" which will occur on October 20-21 at the Baltimore Convention Center. Planned by Med Chi's Committee on Drugs in concert with the Physician's Rehabilitation Program, this conference is approved for 12 hours in Category I of the AMA Physician's Recognition Award and accepted for 12 prescribed hours by the American Academy of Family Physicians. To receive a complimentary pre-registration form or to register by phone or for more information, call Vivian Smith in the Public Relations Department at 301-539-0872 or toll free 1-800-492-1056.

Med Chi Membership Directory

Recently, Med Chi sent its members a green address verification form for the 1991 Med Chi Membership Directory. Along with this form, a key to the medical specialty codes, specialty boards, and specialty society codes was mailed. Unfortunately, the American Board of Internal Medicine (020) was inadvertently omitted from the specialty boards key and other typographical errors appeared on the page. A corrected key to these codes follows this newsletter. Please refer to this key when completing your green address verification form or when responding to questions about various specialty codes. Med Chi regrets any inconvenience caused by this error. If you have any questions or comments about the key or about the address verification forms, please contact Betsy Newman in the Public Relations Department at 301-539-0872 or 1-800-492-1056.

Physician Office Laboratory Regulations

Pursuant to the adoption of new physician office laboratory regulations in Maryland on August 6, 1990, the Department of Health and Mental Hygiene (DHMH) Laboratories Administration is requesting certain information from physicians. A "survey" will eventually be sent to all physicians who indicated on their last medical license renewal application that they performed any laboratory test. The survey requests physicians to indicate the director of the laboratory and to list all the physician members associated with the practice. The data obtained from the survey will form the basis for future questionnaires that the Laboratories Administration will be mailing to physicians. Physicians should respond as quickly and accurately as possible to all surveys.

In the survey, the Laboratories Administration is expected to request physicians to indicate which laboratory tests they perform. Although some physician laboratories will be exempted from certification because they perform certain tests, all laboratories will be required to complete an application form and submit an application fee.

Please contact Greg Hall in the Legal Department at 301-539-0872 or 1-800-492-1056 with any questions regarding the regulations or their implementation process.

Med Chi Compendium

Med Chi's *Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland* (1990 edition) is now available for all Med Chi members. An outstanding reference, the *Compendium* summarizes Maryland health laws and regulations, outlines a collection of Med Chi and AMA ethical standards, lists current Med Chi policies, and provides guidelines for physicians and codes of cooperation for medical professionals. For a free copy of the *Compendium*, contact Bernadette LaRue in Med Chi's Legal Dept. at 301-539-0872 or 1-800-492-1056.

DHMH Revises Voluntary and Involuntary Admission Forms

The Maryland Department of Health and Mental Hygiene (DHMH), in an August 1, 1990 memorandum, provided new forms to Med Chi and other interested parties related to the topics below. These forms were revised in March to reflect the requirements of applicable statutes. Please note that, by law, only these forms provided by DHMH may be used for the purposes indicated. The revised DHMH forms are:

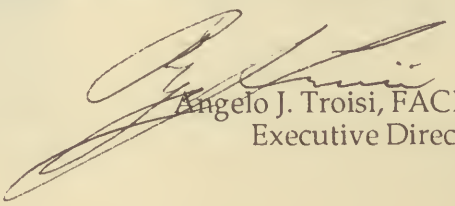
1. Physician's Certificate to Accompany Application for Involuntary Admission;
2. Application for Voluntary Admission;
3. Application by Parent or Guardian for Admission of a Minor;
4. Notification to Individual of Admission Status and Rights; and
5. Application for Involuntary Admission.

If you would like to receive a copy of any of these forms, please contact Greg Hall in the Legal Department at 301-539-0872 or 1-800-492-1056.

Med Chi Handbook and Bylaws

Copies of the Med Chi *Handbook* for 1990-1991 and the May 1990 edition of Med Chi's *Bylaws* are now available for all members. The *Handbook* provides a listing of all Faculty officers, committee members, component medical societies and specialty societies. Committee member listings in this year's *Handbook* include a complete address and medical specialty codes. The *Bylaws* are a guide to the Faculty administration. For a free copy of either of these publications, contact Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056.

Doctor/Lawyer Partnership Against Drugs



On September 25, 1990 Med Chi and the Maryland Bar Association held a press conference to announce its Doctor/Lawyer Partnership Against Drugs, a program that will bring doctor/lawyer education teams into schools to discourage 7th graders from using drugs. The program is essentially a "rap-session" where the physician will talk with students about the physical dangers of drug abuse while the lawyer will emphasize the legal consequences of using drugs. Physician volunteers are urgently needed to participate in this effort. For more information about how to become involved, contact your local component society or call Betsy Newman in the Public Relations Dept. at 301-539-0872 or 1-800-492-1056.

Homeless Shelter Project

The Extra Care Homeless Shelter Project is proposing to establish a 38-bed 24-hour convalescent shelter for physically ill homeless people. The facility will be located in a vacant former nursing home on Arunah Avenue in Baltimore. Skilled nursing will be provided by visiting nurses, and staff will provide counseling and advocacy as part of discharge planning. If you would like to contribute to the start-up funding or would like more information about the project, contact Susan P. Tippett, Committee Chairperson at 301-547-1121.

Maryland Access to Care Application

All physicians are encouraged to complete the application for the Maryland Access to Care (MAC) program that follows this newsletter. Under MAC, physicians will provide primary medical care to Medicaid recipients. Medicaid recipients will be required to choose a physician, provider group, or clinic to serve as their primary care provider. Recipients who fail to select a provider will be assigned one. If the recipient needs medical care, except in an emergency, he or she must call the primary care provider for an appointment or a referral to another source if appropriate. This change in the Medicaid program represents a commitment to shift care to community providers and, at the same time, increase fees for cognitive visits (by an average of 50%).

Comments: _____

_____

_____

_____

(Continued on Reverse)

By signing this Addendum to the Provider Agreement, I agree to serve as a Primary Medical Provider (PMP) for the Maryland Medical Assistance Program. As a PMP, I agree to:

1. Provide comprehensive primary health care services to all eligible Medical Assistance recipients who choose or are assigned to my practice. I have the option of not taking assigned patients.
2. Maintain 24- hour/7 day-a-week availability through call arrangements or back-up coverage.
3. Refer recipients for specialty care, hospital care and other services when medically necessary and appropriate (at no financial risk to me or my practice). I understand that the duration of such a referral will be at my discretion, but will conform with standard medical practice and will be fully documented in the patient's medical record.
4. Authorize services provided by other providers if I determine those services to be medically necessary and appropriate. (Authorization can occur only if a PMP permits use of provider number on billing form of another provider.) Emergency services and certain other services identified by the Program will not require prior authorization.
5. Furnish services during a regular schedule of office hours, including a minimum of 20 hours per week on no fewer than three days of the week, unless otherwise agreed to by Medical Assistance.
6. Maintain a single patient record on each recipient and, for group practices or clinics, designate a single provider within the group as the principal provider for the recipient.
7. Notify the recipient of my intention to request his/her removal from my caseload prior to submitting the request to the Program. I will continue to provide treatment to the recipient until he/she is assigned to another PMP.
8. Provider or assure EPSDT/Health Kids services for patients under 21.
9. Furthermore, I will not request the removal of a recipient solely on the basis of the recipient's age, sex, creed, color, physical or mental handicap, marital status, national origin, sexual preference or type of illness or condition (except when the illness can be treated more effectively by another provider).

The Maryland Medical Assistance Program will:

1. Provide information regarding all PMP practices (as provided on the reverse side of this Addendum) to at least all eligible recipients in the PMP's zip code.
2. Pay increased fees to physicians reimbursed through the Physician Fee Schedule of the Program when this program is implemented.
3. Send periodic reports to PMP's that profile the utilization and cost of services provided to those linked with the practice.

The Program may terminate this Addendum if it is determined that the PMP has violated any provision of this Addendum, including providing or authorizing medically unnecessary or inappropriate care to a Program recipient.

HERE'S ONE DOCTOR WHO WON'T PAY HIS MALPRACTICE PREMIUMS THIS YEAR.

The Army covers his premiums. Since he's an Army Physician, there are a lot of worries associated with private practice that he won't have to contend with. Like excessive paperwork, and the overhead costs incurred in running a private practice.

What he will get is a highly challenging, highly rewarding experience. The Army offers varied assignments, chances to specialize, or further your education, and to work with a team of dedicated health care professionals. Plus a generous benefits package.

If you're interested in practicing high quality health care with a minimum of administrative burdens, examine Army medicine. Talk to your local Army Medical Department Counselor for more information.

Greater Baltimore Medical Center: 25 Years of Medical Leadership

L. Myrton Gaines, Jr., MD

Dr. Gaines is the Chief of Staff at Greater Baltimore Medical Center.

The collection of articles in this issue of the *Maryland Medical Journal* are offered in recognition of the 25th Anniversary of the Greater Baltimore Medical Center (GBMC). Formed by the merger of two established downtown medical facilities, GBMC traces its roots to the Hospital for Women of Maryland, founded in 1885, and Presbyterian Eye, Ear, and Throat Charity Hospital founded in 1883.

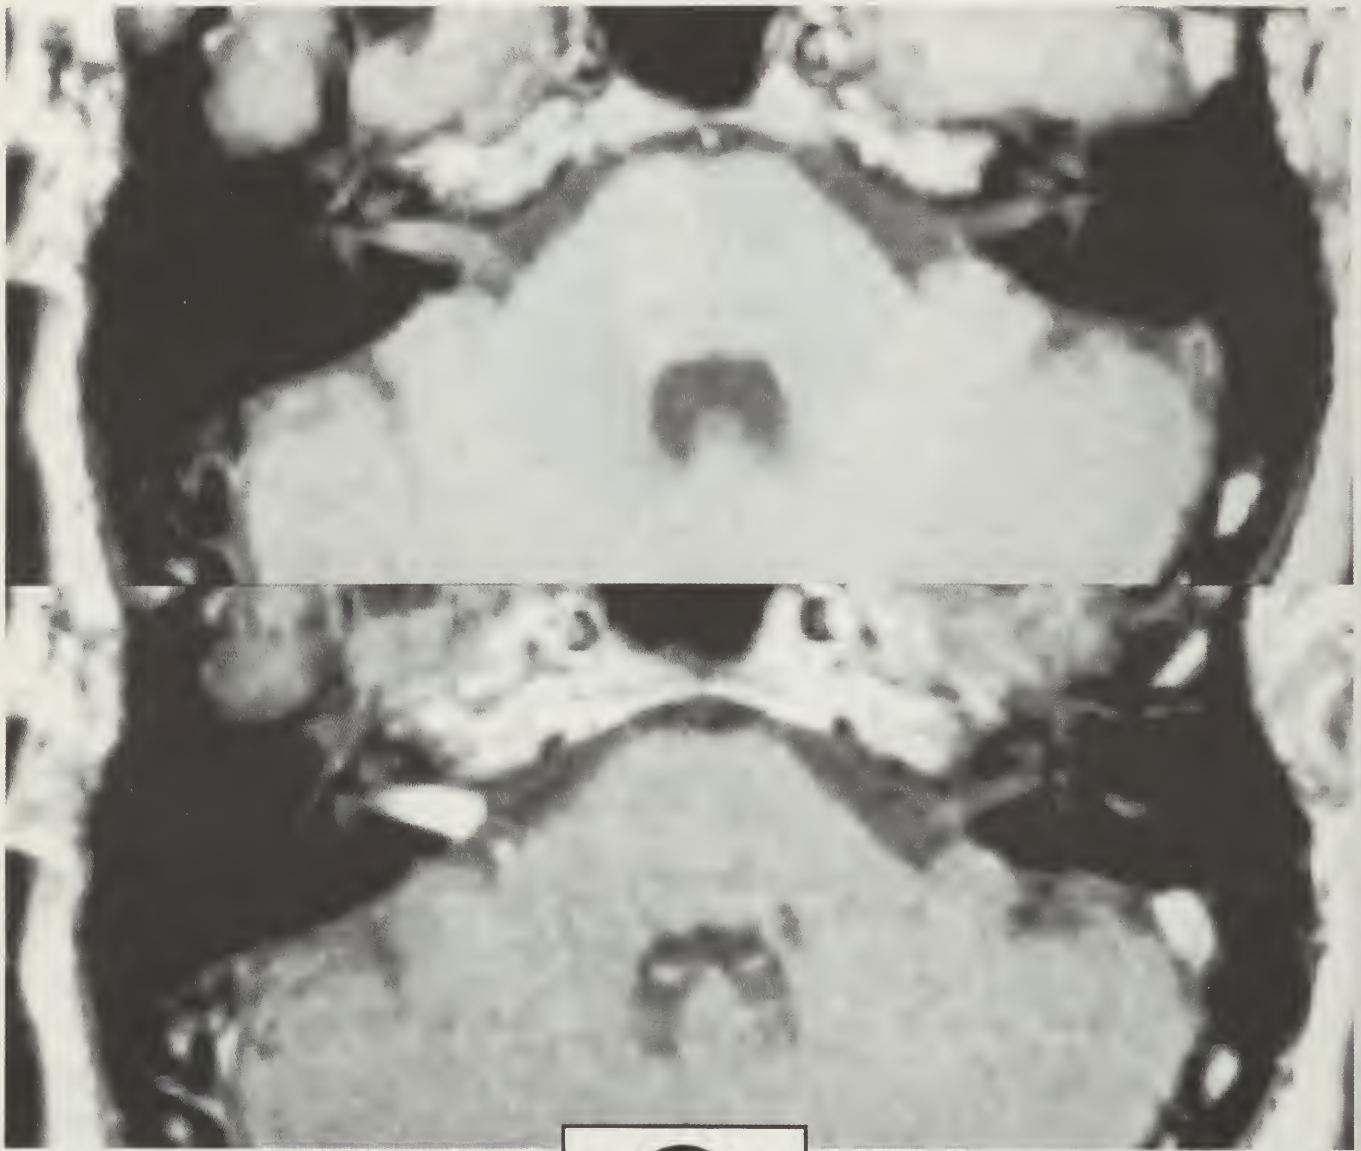
These two specialty hospitals joined forces in 1965 to form the 400-bed Greater Baltimore Medical Center. GBMC has grown into a full-service community hospital providing a number of centers of excellence, as well as residency education programs in Internal Medicine, Obstetrics/Gynecology, Ophthalmology, and Otolaryngology.

Several articles address areas in which GBMC has consistently excelled. The Department of Otolaryngology - Head & Neck Surgery has a leadership position in Maryland which is exemplified by Dr. Loury's article on olfaction. Dr. Garcia, from our internationally acclaimed *in vitro* fertilization program, highlights our strength in women's health, fertility and reproductive endocrinology.

GBMC is also recognized for its Departments of Surgery, Anesthesiology, Internal Medicine, Ophthalmology, Pathology, and Diagnostic and Interventional Radiology. Dr. Prout's article on diabetes mellitus, Dr. Mersey's discussion of combination therapy, Dr. Haile's description of parvovirus and epidemic arthritis, and the review of cervical spine surgery by Dr. Murray et al are evidence of the quality work being performed in these departments.

In 25 years, GBMC has expanded to offer the highest level of healthcare, enabling it to attract some of the finest physicians, nurses and other clinical specialists in the country. As proud as we are of the past, it is the future which will determine the leaders in the medical field. GBMC's future plans include the expansion of its oncology services into a community cancer center. Dr. Cohen's article addresses the community hospital's role in cancer research. Drs. Brookland and Blumberg's article on radiation therapy for breast cancer represents the fine work that can be accomplished in this setting.

GBMC invites you to join us in our quarter of a century celebration by reading this issue of the *Maryland Medical Journal*, written by our physicians about the exciting work they are doing. We are very proud to be an integral part of medicine in Baltimore today. ■



Our Pictures Are Worth A Thousand Words.™

Case #11

45 year old male complained of hearing loss in the right ear along with occasional headaches and dizziness.

Diagnosis: ACOUSTIC NEUROMA (Schwannoma of the 8th cranial nerve)

Note the asymmetric enlargement of the 8th nerve affecting the intracanalicular portion of the nerve on these T1 axial images. Most acoustics are readily detected by MRI; however, contrast administration (Gadolinium-DTPA) markedly shortens the T1 of the tumor, increasing its conspicuity (especially with small lesions) and easily delineating the lateral extent of the tumor in the canal. MRI is the scanning procedure of choice for detection of small lesions. Further sensitivity is attained with use of GD-DTPA.

At Drs. Copeland, Hyman & Shackman, P.A. we are proud of our high resolution, state-of-the-art imaging. We look forward to consulting with you on any diagnostic imaging procedure in order to best serve you and your patients in the most expeditious and economic manner.

We provide convenient evening and weekend hours at both MRI locations, double-readings for quality assurance, and FAX capabilities for delivering reports immediately.

You work hard to gain your patients' trust and confidence. At Drs. Copeland, Hyman & Shackman, we'll help you keep it.

Drs. Copeland, Hyman & Shackman P.A.

MRI Examinations available at:

Pomona Square Suite 119	White Square Imaging Center
1700 Reisterstown Rd.	9105 Franklin Square Drive

Current Concepts in Olfaction

Mark C. Loury MD

Dr. Loury is the Director of Geriatric Otolaryngology, Head and Neck Surgery, Greater Baltimore Medical Center.

Because of the location of the olfactory epithelium and bulb, the processes involved in olfaction have been difficult to evaluate. However, the recent application of comprehensive nasal endoscopy, reproducible olfactory testing, and molecular biologic techniques to the study of the transduction of olfactory information has elucidated some of the events in odorant perception.

Olfaction has been largely neglected for two reasons: The deficits associated with anosmia do not interfere with autonomous functioning to the degree seen with vision or hearing loss; and it has remained largely inaccessible because of its remote position in the superior nasal vault and anterior cranial fossa. Olfactory dysfunction, however, can impair flavor appreciation and potentially induce a state of chronic malnutrition. More importantly, a disturbance in olfactory sensation may affect the perception of danger situations which have olfactory cues, such as spoiled food, methane gas leaks, and fire.

A patient presenting with an olfactory complaint often poses a diagnostic and therapeutic challenge. Part of the difficulty lies in the myriad of etiologies of olfactory dysfunction. Another factor has been the lack of standardized testing and reporting procedures to quantify and qualify olfactory loss. Finally, a lack of basic science research into the molecular processes involved in olfactory transduction has hindered the development of rational pharmacological interventions. Fortunately, each one of these areas has recently been the focus of more intense investigation so that a more coherent concept of the olfactory process now exists.

The otolaryngologist, head and neck surgeon, occupies the pivotal role in the diagnosis and treatment of olfactory loss. No other specialty concentrates on the management of sinonasal disorders, many of which impair the sense of smell. Indeed, the most common cause of olfactory dysfunction is inflammatory disease in the sinonasal tract.[1] Since most of these illnesses are medically or surgically treatable, patients with secondary olfactory loss can often be successfully managed.

National Center for Health Statistics data reveal that over 30 million people, or about 13.5 percent of the population, suffer from chronic sinusitis. Interestingly, chronic sinusitis is the most common chronic illness, defined as any disease persisting for more than three months.[2] Nasal polyposis affects another 9 percent of the population. On a preoperative questionnaire, 30 percent of individuals with radiographic and endoscopic evidence of chronic sinusitis had a subjective olfactory loss (D. Kennedy, personal

communication). All patients with diffuse nasal polyps have a complaint of olfactory dysfunction. Therefore, over 10 million people have hyposmia/anosmia which is potentially treatable by either medical or surgical management of the underlying inflammatory process. These numbers are probably underestimates because 1) underreporting is seen by these survey techniques and 2) significant changes in odorant threshold must occur before the diminished odorant perception becomes symptomatic.

Evaluation

Many disorders and drugs are associated with olfactory dysfunction. Scott[3] has identified more than 200 medical disorders and over 40 medications associated with olfactory loss. She lists congenital, endocrine, iatrogenic, infectious, hepatic, neurologic, psychiatric, and local abnormalities. Numerous industrial chemicals[3] and medications[4] are also known to precipitate olfactory dysfunction.

Fortunately, the etiology of most patients' olfactory loss falls into only a few categories. The most common cause of olfactory dysfunction is sinonasal tract inflammation, accounting for thirty percent of the 600 dysosmic patients presenting to the Connecticut Chemosensory Clinical Research Center.[3,5] Classically, the loss of smell associated with sinonasal tract inflammation fluctuates, improving or worsening depending on the acquiescence or escalation of the disorder, respectively. When the underlying process abates spontaneously or by treatment, olfaction improves. A short oral course of steroids associated with a concomitant, documentable improvement in olfactory testing strongly suggests underlying sinusitis.[1,6] The presence of severe nasal obstruction beginning in infancy which is not resolved, may lead to permanent anosmia.[7] It is hypothesized that the development of the olfactory pathways requires olfactory input during a yet undefined critical period.

The second most common cause of olfactory loss is a result of an upper respiratory tract infection (URI) and accounts for about 15 percent of patients. It is diagnosed when no other cause of dysosmia can be identified and when temporally related to a URI.[3] The next most common cause of dysosmia is head trauma (about 10 percent), occuring in 4-5 percent of all patients incurring head injury.[8,9] Regrettably, no effective therapy exists for individuals suffering from olfactory loss caused by either head trauma or URI. These individuals may benefit from the addition of flavor enhancers (which are actually concentrated odorants) to their food in the hope of stimulating any residual olfactory reserve. Oral intake and nutritional status have actually improved when this approach has been tried.[10]

Because of the many etiologies of olfactory dysfunction, a thorough history is required. The onset of the loss and its relationship to underlying medical illnesses, trauma, institution of new medications, infectious upper respiratory tract disease, inflammatory rhinosinusitis, environmental exposure, etc. must be clarified. After determining the history, further evaluation requires a complete examination of the head and neck, focusing particularly upon the sinonasal tract. Comprehensive intranasal endoscopic diagnosis using rigid endoscopes has greatly improved this aspect of the evaluation. Not only are subtle changes in the osteomeatal complex associated with chronic sinusitis more clearly identified, but anatomic abnormalities of the middle meatus which predispose the development of chronic sinusitis can also be seen.[11-16] Because of the excellent illumination and deflected angles of view, the superior nasal vault can be thoroughly examined. High septal deflections and superior meatal nasal polyps which prevent odorant access to the olfactory epithelium can be identified. Anterior rhinoscopy is totally inadequate in this regard. When computed tomographic examination is performed for chronic sinusitis, there is excellent delineation of the superior nasal vault, olfactory groove, and cribriform plate (Figure 1). Space-occupying olfactory groove lesions can also be seen.

The examination is concluded by olfactory threshold and odorant discrimination testing. Graded dilutions of various substances have been successfully used, including 1-butanol,[1] pyridine, thiophene, and phenethyl alcohol.[17] Monorhinic thresholds are determined in a forced-choice procedure using graded dilutions of the odorant compared to diluent alone as the blank. Trigeminal stimulants are employed for suspected cases of malingering. Odorant discrimination testing can use either microencapsulated fragrances[18] or coded containers containing common fragrant sub-

Figure 1. Coronal CT scan demonstrating medialized middle turbinate contacting nasal septum. Access to olfactory epithelium obstructed. (■) - cribriform plate.

stances including mixed trigeminal-olfactory stimulants.[1] The participant is provided with a closed list of choices including both the names of the tested substances and an equal number of names of substances which are not presented to the patient.

In spite of more accurate reproducible testing and other diagnostic advances, 40 to 45 percent of patients still have olfactory dysfunction of undetermined cause. Recent advances in the understanding of olfaction at the molecular level offer the greatest hope for the diagnosis and treatment of these individuals.

Olfactory Transduction

The olfactory system is unique in that the receptor neurons are directly exposed to the environment. Therefore, alterations in the intranasal milieu can potentially influence odorant perception. This concept is most simply illustrated by complete nasal obstruction where there is no odorant delivery to the olfactory epithelium. It has been conjectured that the olfactory loss seen in inflammatory sinonasal tract disease is a result of an interplay between the observed obstruction and alterations in the mucus blanket. Important events which ultimately affect the interaction between an odorant molecule and a specific receptor on the olfactory neuron are termed perireceptor events.[19] These perireceptor events include odorant delivery to the nasal cavity, dissolution of the odorant into the mucus layer which bathes the olfactory cilia, and odorant clearance.

Most odorant molecules are hydrophobic and require volatilization. To interact with the olfactory neuron cilia, an odorant must enter the nasal cavity and become dissolved in the mucus in a high enough concentration to exceed the detection threshold. Mucus consists of more than 95 percent water and contains polysaccharides with high charge densities. It owes its hypertonicity, in part, to the active secretion of chloride ions by the nasal glands.[20] Partition coefficients of odorants favor solubilization into more charge-neutral, hydrophobic environments.[21] Any increase in the volume of secretions by inflammatory or neurogenic processes effectively dilutes the concentration of odorant with a concomitant elevation in threshold. Similarly, any increase in the relative concentration of mucopolysaccharides may inhibit odorant partitioning into this more hydrophilic environment. Mucus from patients with chronic sinusitis is more viscous, which decreases its mucociliary clearance.[22] This increase in viscosity is due to an increase in mucopolysaccharides.

Olfaction is remarkably sensitive, able to detect thresholds ranging from 10^{-9} to 10^{-11} molar.[23] However, electrophysiologic responses of olfactory neurons indicate that only 50 percent neuron activation occurs at micromolar concentrations.[24,25] Therefore, there is a thousand-fold difference in the concentration required to elicit a behavioral response compared to a neuron action potential. It is hypothesized that there is differential partitioning of the odorant so that its concentration in the mucus blanket is actually greater than that predicted by its partition coefficient. A possible candidate for this role is odorant binding protein (OBP), a recently purified soluble protein secreted by nasal glands. OBP has been identified in both rat and cow, binds a wide range of odorants from many different chemical classes, represents about 1 percent of all intranasal proteins, and is restricted to the nose.[26-28] It exists as a dimer and may manifest negative cooperativity, i.e., it will bind a single odorant for a prolonged period of time but rapidly releases it when another odorant is presented.[21] Alternatively, OBP may help in the clearance of odorants from the olfactory receptors so that other odiferous substances may interact with them.

Odorant clearance may also be facilitated by an olfactory-specific cytochrome P-450 which has recently been cloned and is localized to olfactory epithelium. It probably resides in the membrane of the endoplasmic reticulum. Many mRNA copies of the phenobarbital-inducible cytochrome P-450b are also present in olfactory epithelium. This cytochrome is not constitutively expressed in the liver and appears after phenobarbital challenge.[29] It is not known if this P-450b expression in the olfactory epithelium is constitutive, or if it has been induced by environmental substances. Olfactory epithelium actively metabolizes many compounds including odorants.[30] Nef[29] conjectures that these cytochromes hydroxylate odorants and other substances to turn off the olfactory signal. Degradatory enzymes for extracellular signals are crucial for mate localization in moths[31] and may account for crustaceans' rapid detection of small concentration changes in amino acid concentrations in the external environment.[32] Alternatively, hydroxylation may make some odorants more potent and actually enhance their binding to odorant receptors. Certain environmental and ingestible substances, e.g., ethanol or phenobarbital, may induce the synthesis of other cytochrome enzymes. By increasing the rate of odorant clearance, hyposmia or anosmia may result. This proposed sequence of events may account for some of the observed medication- and chemical-induced declines in odorant perception.

These perireceptor events of odorant delivery, partitioning, and clearance, all precede or follow binding of the odorant molecule to the receptor. Several lines of evidence indicate the presence of membrane-bound receptors. First, the ability to discriminate hundreds of odorants implies a specific interaction between an odorant ligand and a receptor instead of a nonspecific interaction such as neuronal membrane perturbations induced by intercalation of the hydrophobic molecule into the neuronal plasmalemma. Second, the observed detection of substances in the ratio of one part per billion[21,23] strongly implicate a specific ligand-receptor phenomenon. Third, stereoisomers such as L- and D- carvone are perceived differently. Stereoselective differences in perception suggest distinct receptors.

Odorant receptors are localized to the olfactory neuronal cilia. Potential candidates for these receptors include glycoproteins[33,34] and other membrane proteins.[35] Antibodies to these putative receptors are capable of diminishing electro-olfactogram responses. However, no binding of tritiated odorants to specific receptors on olfactory epithelium has yet been demonstrated.[28]

The odorant-receptor complex initiates a cascade of reactions which ultimately generate an action potential. Olfactory epithelium has high levels of basal adenylate cyclase activity which synthesizes cyclic adenosine monophosphate (cAMP).[36-38] This activity can be stimulated by guanosine triphosphate (GTP). When 100 micromolar concentrations of odorants are added to olfactory ciliary preparations, adenylate cyclase activity increases. Putrid odorants and chemical solvents have little stimulatory activity.[38] Also, GTP-activated phosphoinositide (PI) turnover is present in olfactory tissue.[39] Both the adenylate cyclase and phosphoinositide systems generate intracellular second messengers via guanine nucleotide binding proteins (G-proteins).[40]

G-proteins consist of three subunits (Figure 2). The alpha subunit interacts with the receptor and in its normal unactivated state binds guanosine diphosphate (GDP) and is associated with both beta and gamma subunits. The alpha subunits can either be stimulatory or inhibitory, and show some tissue specificity, e.g., retinal G-alpha (transducin). The olfactory epithelium has a tissue specific G-alpha that stimulates cAMP formation[41] (Figure 3). The beta-gamma heterodimer can interact with various alpha proteins. When the ligand binds the receptor which itself is associated with the trimer, the GDP is replaced by GTP with dissociation of the beta-gamma subunits. The GTP-activated alpha subunit then activates many copies of adenylate cyclase (the effector) which generates cAMP. After the cAMP activates protein kinase (PK), it is degraded by phosphodiesterase (PDE). The active PK phosphorylates ion channels causing an influx of cations with the generation of an action potential. Cyclic AMP may activate the channel directly.[42] The inherent GTP-ase activity of the alpha subunit creates GDP which inactivates the cascade, whereupon the alpha subunit releases the effector and rebinds to the beta-gamma complex. The cAMP signal can be enhanced and prolonged by the addition of caffeine or theophylline which inhibit the action of PDE.[43]

The PI system also consists of a receptor that interacts with a G-protein (Figure 4). However, the effector enzyme is a phospholipase C which cleaves phosphatidylinositol bisphosphate (PIP2) into diacylglycerol (DAG) and inositoltriphosphate (IP3). The DAG remains in the membrane and activates protein kinase C (PKC) which proceeds to activate by phos-

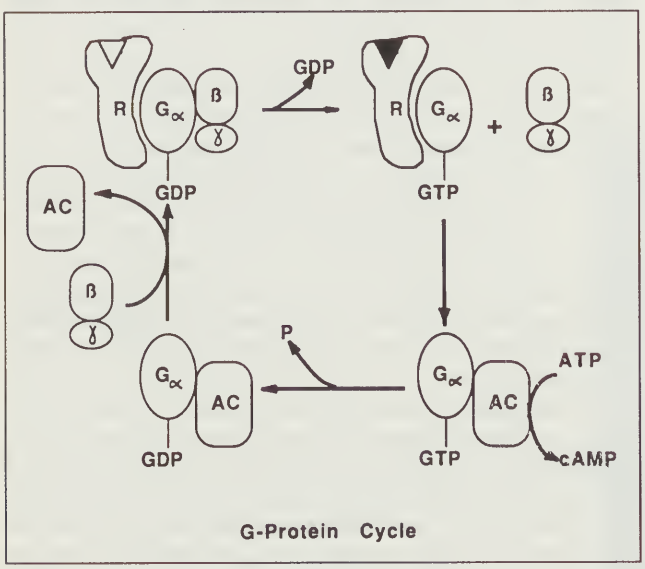

Figure 2. G-PROTEIN CYCLE Sequence begins in upper left. Unstimulated complex consists of receptor with open binding site and guanosine diphosphate (GDP) bound to G ∝ subunit of G protein heterotrimer. Binding of odorant (▼) to receptor (R) initiates exchange of GDP for guanosine triphosphate (GTP) with release of $\beta\gamma$ complex. This activated G∝ -GTP moiety then activates numerous effector proteins; in this illustration, adenylate cyclase (AC). The AC generates the second messenger cAMP from ATP. An inherent GTP-ase in the G∝ subunit cleaves a phosphate (P) off of GTP, forming GDP which deactivates G∝. AC stimulation ceases. G-GDP then reassociates with the $\beta\gamma$ complex.

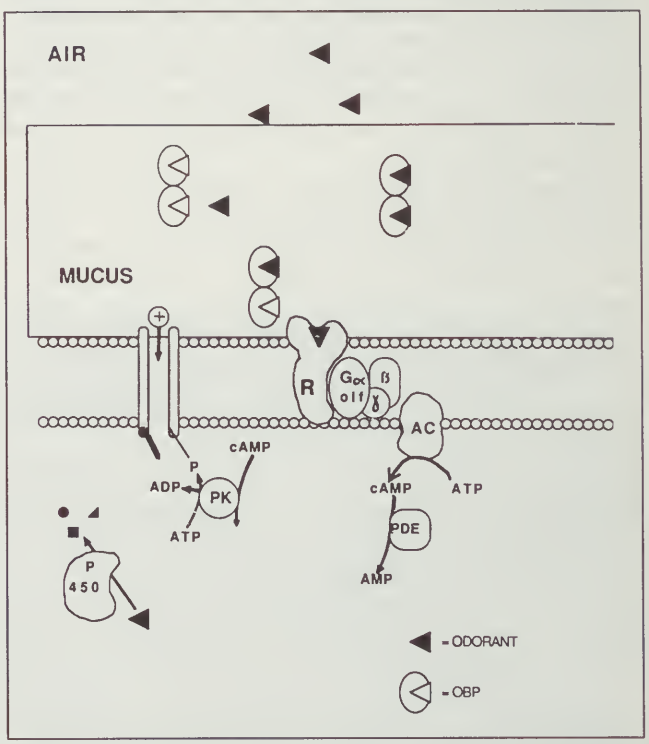

Figure 3. OLFACTORY TRANSDUCTION VIA ADENYLATE CYCLASE PATHWAY. Perireceptor events include odorant partitioning in mucus layer and binding to OBP (▼); cyclic adenosine monophosphate (cAMP) activation of protein kinase (PK) which phosphorylates (P) an ion channel using adenosine triphosphate (ATP); cytochrome (P-450) degradation of odorant; and deactivation of cAMP by phosphodiesterase (PDE) hydrolysis with the formation of adenosine monophosphate (AMP). Receptor events include odorant binding to receptor (R) and G-Protein ($G^{\alpha}_{olf}, \beta, \gamma$) activation of adenylate cyclase (AC). AC forms cAMP from adenosine triphosphate (ATP). (•, ■, ▼) - odorant metabolites, + - cation.

phorylation, various intracellular proteins. The IP3 that is released intracellularly opens a calcium channel in the endoplasmic reticulum, thereby releasing calcium.

Conclusion

An accurate determination of the etiology of olfactory loss is the most important step in deciding which interventions to use. Treatment of any underlying medical illness, e.g., hypothyroidism, is necessary. In those individuals with inflammatory or infectious disease of the sinonasal tract, aggressive medical treatment is begun. For those individuals with an atopic illness, options include avoidance of the antigen, oral antihistamines, topical and systemic steroids, decongestants, and desensitization. Symptomatic improvement should be correlated subjectively and objectively with improved olfactory function. For the patient with chronic sinusitis, steroids, decongestants, and antibiotics are the mainstays of medical management. Surgery is reserved for those people with persistent or frequently recurrent symptoms. Restoration of aeration and physiologic routes of drainage are the goals of surgery. Any structural impediment to the free flow of air by either septal deviations, refractory hyperplastic mucosa, and/or nasal polyposis requires operative intervention.

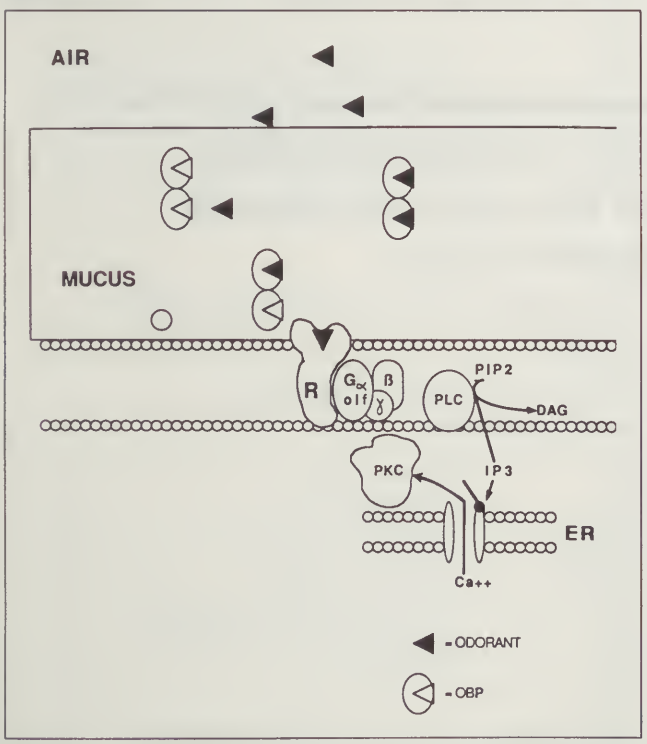

Figure 4. OLFACTORY TRANSDUCTION VIA PHOSPHOINOSITIDE PATHWAY. Odorant binding to receptor (R) activates G-protein (G_{olf}, β, γ). Activated G_{olf} activates phospholipase C (PLC) which cleaves phosphotidylinositol bisphosphate (PIP2) into diacylglycerol (DAG) and inositol triphosphate (IP3). IP3 opens a calcium channel on the endoplasmic reticulum (ER) with release of stored calcium (Ca++) into the cell. Calcium then activates protein kinase C (PKC) which then phosphorylates intracellular proteins and induces their activity.

For those patients suffering from irreversible olfactory loss, the options are fewer. Flavor enhancers may be useful. Since the hedonic value of food is diminished by hyposmia or anosmia, other strategies may be employed to make food more appealing. Variety in food appearance, texture, and type, appeal to other senses that participate in the enjoyment of eating. A trial of theophylline or aminophylline may prove helpful. For those people who are anosmic, smoke detectors are mandatory. Family members should become involved in food preparation to sense food spoilage. As receptor and second messenger systems become better understood, rational pharmacologic manipulations of the olfactory transduction sequence might be feasible.

The In Vitro Fertilization Program at the Greater Baltimore Medical Center

Jairo E. Garcia MD

Dr. Garcia is the Director of the Women's Hospital Fertility Center and IVF Program at Greater Baltimore Medical Center.

During its six years of existence, GBMC's IVF program has achieved a 23 percent "take home baby" rate per cycle with embryo transfer.

Louise Brown was the first human conceived and delivered after a successful in vitro fertilization and embryo transfer (IVF-ET) pregnancy.[1] The success achieved by Steptoe and Edwards in July 1978 in England was followed by that of the Australians in 1980. Those pregnancies were achieved after the aspiration of one oocyte from a natural menstrual cycle. In 1981, the Norfolk Program succeeded only after inducing ovulation with human menopausal gonadotropins (hMG) and human chorionic gonadotropin (hCG). In 1986, the IVF Program at the Greater Baltimore Medical Center (GBMC) reported the first baby delivered in the United States from a natural oocyte fertilized in vitro.

The groundwork for the IVF Program at GBMC was laid in 1983 by the combined efforts of the Department of Gynecology under the chairmanship of Dr. James H. Dorsey, and the Department of Pathology under the chairmanship of Dr. John E. Adams, with the moral and financial support of the GBMC Administration under the leadership of Mrs. Sheila Riggs. To encompass all aspects of infertility management, including IVF, the Women's Hospital Fertility Center was established in 1983 under the direction of Dr. Theodore A. Baramki, head of the Division of Reproductive Endocrinology. Dr. Frederick G. Weinstein was appointed director of the IVF Program in July 1984. The first oocyte retrieval took place in September 1984 and the first IVF baby was delivered in the summer of 1985.

In July 1985, I joined GBMC as the Director of the Women's Hospital Fertility Center. Since then, our IVF Program has experienced tremendous growth and success, and is considered one of the largest IVF programs in the United States and in the world.

The IVF program at GBMC has participated in the implementation of several IVF technologies, evolving according to the patients' needs. It has also expanded the IVF concept to other assisted reproductive procedures such as gamete intrafallopian transfer (GIFT), zygote intrafallopian transfer (ZIFT), embryo cryopreservation, donor oocyte, and gamete micromanipulation.

Patient Selection

Originally, IVF was indicated for patients with absent or irreparable fallopian tubes (previous salpingectomies for ectopic pregnancies, pelvic inflammatory disease, failed tuboplasty, or tubal reanastomosis). Nowadays, the indication for IVF/ET has broadened to include other fertility problems: endometriosis refractory to medical or surgical treatment; Diethylstilbestrol (DES) exposure in utero; severe cervical factor with unsuccessful intrauterine inseminations; male factor, such as severe oligospermia, asthenospermia, and immunologic factors (sperm antibodies); and five years of unexplained infertility (normal infertile couple, NIC) (Table 1).

A complete infertility workup is imperative in all patients. It is desirable to have general good health, a normal endometrial cavity (with the exception of DES patients), preferably regular menstrual cycles, a normal endometrial biopsy, negative cervical cultures (chlamydia, ureaplasma urealyticum), and adequate numbers of sperm (>1.5 million recovery after sperm wash). Accessibility of the ovaries through laparoscopy is no longer a prerequisite, since 97 percent of oocyte retrievals are done transvaginally under ultrasound guidance.

To be admitted into this program the patient has to be under the age of 40. Although the pregnancy rate per embryo transfer remains almost constant until the age of 44, the ongoing pregnancy rate decreases significantly after the age of 40 due to an increase in the miscarriage rate.[2]

In our IVF/ET program, we do not limit the number of oocyte retrieval attempts because, in our experience, the pregnancy rate per attempt and per embryo transfer remains constant regardless of the number of cycles with oocyte retrieval.[2] Furthermore, 33 percent of our patients have already undergone IVF/ET at other institutions.

Ovarian Hyperstimulation and Monitoring

The first IVF pregnancies resulted from oocytes retrieved during the natural, or spontaneous, cycle. In 1981, the Norfolk program decided to use hMG/hCG to stimulate multiple follicle development;[3,4] at the same time, the Australians decided to use clomiphene citrate (CC). During the past decade, multiple protocols for ovarian hyperstimulation have been reported; all of them have been successful but there are variations that make some of them more appealing to a particular IVF center. In our opinion, all IVF centers must be familiar with all the different kinds of protocols. It should be emphasized that there are differences in the monitoring, for example, follicle diameter, estradiol (E_2) levels, duration of stimulation, etc. What applies to CC/hMG/hCG does not apply to the hMG/hCG protocol.

In the IVF/ET Program at GBMC, ovarian hyperstimulation is individualized and tailored to patient need and response. Originally, patients were stimulated with hMG/hCG or pure follicle stimulating hormone (FSH)/hMG/hCG. CC/hMG/hCG was occasionally used. Late in 1987, gonadotropin releasing hormone analog (GnRHa, leuprolide acetate) became available, and it was used on thirteen IVF patients between October and December of that year.[5] These patients had at least six oocyte retrieval attempts and ET, but never succeeded with a pregnancy. GnRHa was used for four weeks prior to administration of FSH/hMG/hCG; six out of thirteen patients became pregnant. With this impressive result, GnRHa became part of our armamentarium for ovulation induction in IVF patients.

GnRHa is structurally similar to GnRH. Because of its agonistic effect when used during the early follicular phase (starting on the second menstrual cycle day), it induces a flare-up of FSH and luteinizing hormone (LH) secretion; therefore, this increased secretion helps to increase the number of recruitable follicles. By the fifth menstrual cycle day, FSH and LH levels decrease once the GnRH receptors are down-regulated. Although administration of GnRHa during the early luteal phase (48 hours post-ovulation, serum progesterone (P) levels >3 ng/ml) induces an increase in gonadotropins, it does not prolong the life of the corpus luteum, and all patients will menstruate at the expected time.

Follicular Phase Leuprolide Acetate, or Flare-up Protocol (FPL) All patients start leuprolide acetate on menstrual cycle day two. Leuprolide acetate is given subcutaneously every morning, at a dose of .75 mg for patients under 75 kg, and 1 mg for patients over 75 kg. Ovarian stimulation with exogenous gonadotropins was not started until cycle day five. One ampule of hMG, containing 75 IU of FSH and 75 IU of LH, along with one ampule of pure FSH containing 75 IU of FSH, were given intramuscularly at 8 a.m., and the same dose of hMG and pure FSH was given at 3 p.m. Blood was drawn daily at 7 a.m. starting on cycle day two. Serum was assayed for E_2, FSH, and LH on cycle days two through five, and for E_2 thereafter. Once the E_2 was >250 pg/ml, daily pelvic ultrasound for follicle monitoring was begun. Ovulation induction was individualized based on serum E_2 and ultrasound findings. When serum E_2 was >270 pg/ml, the afternoon pure FSH was not given. Ovarian stimulation continued with one ampule of hMG and 75 IU of pure FSH in the morning, and one ampule of hMG in the afternoon until two follicles were >12 mm in diameter.

Table 1. Indications for IVF at GBMC

Diagnosis	1987	1988	1989
Tubal Factor	152 (54.2 percent)	122 (50.6 percent)	188 (52.8 percent)
Endometriosis	69 (26.4 percent)	64 (26.5 percent)	71(20.0 percent)
Male Infertility	39 (14.0 percent)	39 (16.0 percent)	57 (16.0 percent)
Normal Infertile Couple	12 (4.2 percent)	8 (3.3 percent)	24 (6.7 percent)
Other	8 (2.8 percent)	5 (2.0 percent)	16 (4.5 percent)

The morning pure FSH injection was stopped, and the patient was continued with one ampule of hMG in the morning and one in the afternoon until two follicles were at least 16 mm in diameter. That evening, 10,000 units of hCG were injected intramuscularly between 9 p.m. and 1 a.m. Oocyte retrieval was scheduled 35-36 hours after the hCG injection. Serum P was measured at 7 a.m. on the day of hCG injection, the day of oocyte retrieval, and the day of embryo transfer.[6]

Luteal Phase Leuprolide Acetate Protocol (LPL). Patients started leuprolide acetate 48 hours after ovulation, or when P levels were >3 ng/ml. Leuprolide acetate was given subcutaneously every morning, at a dose of .75 mg for patients under 75 kg, and 1 mg for patients over 75 kg. Blood was drawn at 7 a.m. once a week. Ovarian stimulation was started after the menstrual period, once FSH and LH levels were suppressed. Pure FSH and hMG were given in the same way as for the flare-up protocol.[6]

Oocyte Retrieval, Fertilization, and Embryo Transfer

Oocyte retrieval by ultrasound guided transvaginal aspiration is done in 97 percent of our patients. Oocyte retrieval by trans-laparoscopic aspiration is reserved only for those patients requiring a concomitant diagnostic laparoscopy. We do not perform operative laparoscopy or tuboplasty in association with oocyte retrieval. The size of the ovaries, vascularization, and the risk of the hyperstimulation syndrome make the whole scenario less than satisfactory for microsurgical intervention. Furthermore, it is preferable to avoid exposing oocytes to general anesthesia and CO_2.

All oocytes obtained are classified according to the degree of maturation. With the use of GnRHa, not only has the number of follicles increased, but the quality of oocytes has improved substantially. The preovulatory oocyte rate has increased significantly from 48 percent to 84 percent. At the same time, there was a decrease in the number of immature and atretic oocytes from 22 percent to 4 percent in each group. These changes represent much better follicular recruitment and synchronization under the GnRHa/FSH/hMG/hCG stimulation protocol. Until December 1989, a maximum of six oocytes were inseminated with 150,000 washed motile sperm per ml of media, 3 to 26 hours after retrieval, depending upon the degree of maturation. In the event of a male factor, 350,000 to 500,000 sperm were used for insemination. The insemination media consisted of Ham's F-10 medium (Gibco, Grand Island, NY), supplemented with 7.5 percent heat-activated fetal cord serum (FCS). On day one after insemination, the cumulus was removed mechanically to look for the presence of pronuclei. If fertilization did not occur, the oocytes were re-inseminated. The overall fertilization rate fluctuated between 72 percent and 76 percent per fertilizable oocyte. After fertilization, the embryos were incubated in 5 percent CO_2 in air at 37° C. Embryo transfer was performed 72 hours after oocyte retrieval, as described by Jones et al.[7]

All patients who underwent ET received supplemental P throughout the luteal phase. If beta-hCG levels were elevated, the patient was given 17-hydroxyprogesterone caproate, 250 mg IM weekly, until the 12th week of pregnancy. Pregnancy was established when at least two serum beta-hCG titers drawn a minimum of ten days after ET were noted to be rising, and there was ultrasonic or histologic evidence of pregnancy. Fetal heart activity and multiple pregnancy were detected by transvaginal ultrasound three to four weeks after ET.

Results

The successful outcome of IVF/ET has been steadily increasing during the past two years in our institution. There are several factors that might have contributed to the higher pregnancy rate. The use of GnRHa during ovarian stimulation brought with it an increase in the quality and quantity of oocytes; therefore, the average number of embryos transferred per patient increased from 2.6 to 3.5. The pregnancy rate per cycle with embryo transfer was 32 percent and 33 percent in 1988 and 1989, respectively. This represents an increase from the 25 percent pregnancy rate achieved in 1987. The miscarriage rate is 27 percent, and the ectopic pregnancy rate of 2 percent remains constant. One-half of the ectopic pregnancies are associated with intrauterine pregnancies (Table 2). The multiple pregnancy rate abruptly increased from 11.5 percent in 1987 to 35.1 percent and 38.5 percent in 1988 and 1989, respectively (Table 3). The increase in the num-

Quadruplets	0	2	4

ber of embryos, pregnancy rate per embryo transfer, and multiple pregnancy are a reflection of the quality of ovarian stimulation, oocytes, and embryos. The live birthrate per cycle with embryo transfer was 22 percent in 1988. The birthrate and ongoing pregnancy rate from 1989 to the present is 23.2 percent (Table 2).

The prognosis for IVF/ET is also related to the age of the patient, the number of IVF attempts performed, the indication for IVF and, finally, the type of ovarian stimulation response. In our program, the ongoing pregnancy rate per ET between July 1985 and June 1988 for patients younger than age 30 was 26 percent. Patients from ages 30 to 36 had an ongoing pregnancy rate per ET between 16 to 24 percent; whereas patients aged 37 and 38 years had an ongoing pregnancy rate of 9 percent and 11 percent, respectively. Although the pregnancy rate per cycle was almost identical, the miscarriage rate varied significantly: patients younger than 30 years of age had a 22 percent risk of spontaneous abortion; patients aged 30-34 years and 35-39 years had a 31 percent and 29 percent risk, respectively. Patients aged 40 and over had a spontaneous abortion rate of 58 percent.[2]

The cumulative clinical pregnancy rate by life table analysis was 95 percent. The probability of pregnancy remained constant during each attempt. Although 60 percent of pregnancies occurred during the first three IVF attempts, the probability of conception per IVF attempt was not different on the fourth, fifth, or tenth attempt. Therefore, our data do not support the recommendation of other IVF centers to limit the number of IVF attempts to only three.

The pregnancy rate per diagnosis is similar for the tubal factor, endometriosis, or the normal infertile couple, 54 percent, 56 percent and 58 percent, respectively. However, it is lower in the male factor, 43 percent. The miscarriage rate is comparable in those three groups, but much higher in male factor patients in which it increases to 40 percent.

The success of IVF is also related to the type of ovarian hyperstimulation response, especially when GnRHa is used. Padilla et al[8] reported the prognostic value of the early serum E_2 response to leuprolide acetate in in vitro fertilization. Four patterns of E_2 response were described according to the E_2 increase during the first five days of stimulation: *Pattern A* - serum E_2 doubled the baseline value by cycle day three, followed by at least a 10 percent drop by cycle day four; *Pattern B* - serumE_2 showed a delayed elevation when doubling of the baseline E_2 level occurred by cycle day four or cycle day five, followed by a fall; *Pattern C* - serum E_2 showed a prompt and persistent rise with no fall by cycle day five; *Pattern D* - E_2 levels remained consistently low during the five days of GnRHa administration. The clinical pregnancy rate per cycle with embryo transfer for Patterns A,B,C, and D was 46 percent, 38 percent, 16 percent, and 6 percent, respectively. The live birthrate per cycle for the different patterns was 39 percent, 38 percent, 11 percent, and 6 percent, respectively (Figure 1). Furthermore, the E_2 profile and the E_2 level on the day of hCG administration correlated very well with a higher pregnancy rate and a lower miscarriage rate when E_2 levels were >2500 pg/ml.[9]

IVF-Related Procedures

Gamete Intrafallopian Transfer (GIFT) has been performed at GBMC since 1986. The ovarian hyperstimulation protocol is similar to the one used for IVF/ET patients. Oocyte retrieval is carried out transvaginally with ultrasound guidance. The oocytes are mixed with 100,000 washed spermatozoa and transferred into the ampullary portion of the tube through the laparoscope, using a double puncture technique. The overall success rate has been 33 percent, and the miscarriage rate is slightly lower than that of IVF, 22 percent. The number of oocytes transferred fluctuates between three and five per patient. The multiple pregnancy rate is 13 percent, which is much lower than in IVF/ET.

Zygote Intrafallopian Transfer (ZIFT) was initiated at GBMC in the fall of 1989. Although our experience is limited, the success rate is no different from the IVF or GIFT procedures.

Donor Oocyte Program. This program has been in existence at GBMC's IVF Program since 1987. Patients are encouraged to donate excess preovulatory oocytes to anonymous recipients. Recipients may have premature menopause, gonadal dysgenesis, ovarian insensitivity, and a history of poor response to ovarian stimulation. The recipient's endometrium is stimulated with an increasing amount of estradiol valerate, given for a period of at least two weeks. If a suitable donor oocyte is not available by the 15th endometrial-replacement day, the patient continues taking the same amount of estradiol valerate until a matching donor is found. With this kind of protocol,

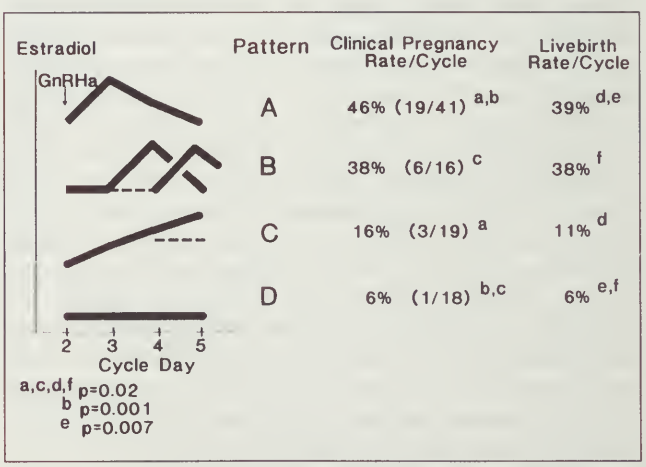

Figure 1. Clinical pregnancy rate and live birthrate per stimulated cycle for each of the early E_2 patterns after the initiation of the leuprolide acetate (GnRHa). (From Padilla SL, Bayati J, Garcia JE: Prognostic value of the early serum estradiol response to leuprolide acetate in in vitro fertilization. Fertil Steril 53:288, 1990. Reproduced with the permission of the publisher, The American Fertility Society, Birmingham, Alabama).

we have maintained patients on standby for up to 57 days before suitable oocytes were available. The pregnancy rate per embryo transfer for the recipient was double that of the overall IVF/ET pregnancy rate. It is possible that the receptiveness of the endometrium is better in our recipients, although the miscarriage rate remains constant.

Cryopreservation. The increased multiple pregnancy rates achieved during 1988 and 1989 prompted us to reconsider our position with respect to embryo cryopreservation. This new program started in January 1990. At the present time, we have succeeded with three pregnancies out of our first five transfers. The cryopreservation program uses strict criteria for patient selection. A maximum of 16 oocytes per patient are inseminated. The patient is encouraged to have the embryos transferred within the next six months, and they are not allowed to undergo further ovarian hyperstimulations until all the embryos have been transferred. The embryos are stored for a period of three years, or extended up to five years in case a pregnancy from the first embryo transfer takes place. If the patient decides not to have the embryos transferred, they will be automatically donated to an anonymous recipient.

Micromanipulation Technique. At present, we are involved in the preliminary stages of this program and hope that it will be available by the time of this publication.

In summary, during its six years of existence, GBMC's IVF program has developed all aspects of the state of the art in assisted reproductive technologies. Our 23 percent "take home baby" rate per cycle with embryo transfer attests to the hard work and dedication of the whole IVF team, including IVF/Andrology technicians, nurses, secretaries, and physicians. It is anticipated that the birth of GBMC's 500th IVF baby will take place around the hospital's 25th anniversary celebration in September 1990.

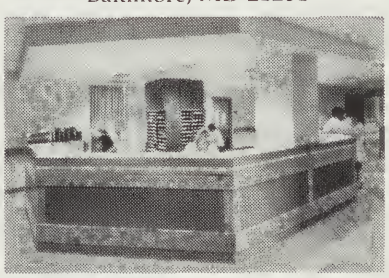
MARYLAND GENERAL PROFESSIONAL CENTER

UPSCALE ENVIRONMENT. DOWNTOWN ACCESSIBILITY.

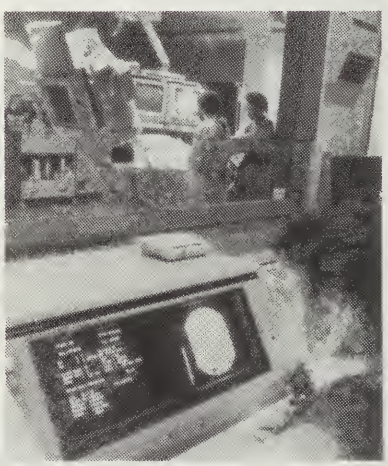
In response to the needs of medical professionals, we've built the Maryland General Professional Center. Reserved solely for the practice of medicine and related services, the center provides a professional atmosphere in a new, beautifully designed location for your practice.

- Central location is easily accessed by major traffic arteries from every direction, is served by the subway station at the State Office Complex, and is conveniently located adjacent to the planned light rail system.
- Conveniently located adjacent to Maryland General Hospital, within walking distance of hospitalized patients and specialized hospital services. Proximity improves coordination of care among patient, physicians and hospital.
- Reduced travel time between hospital and office for both physicians and patients.
- Features include a patient dropoff at the main entrance, 2 elevators (1 sized to accommodate stretchers), sound-conditioned walls, thermostatic controls for each suite, and handicap access.
- Condominium arrangement offers office ownership benefits with low equity requirement. Also available are lease/purchase or leasing options.
- Ample parking available in the enclosed 317-space garage adjacent to the building.
- Located near Meyerhoff Symphony Hall, Lyric Opera House and Center Stage.

For more information, a brochure and a personal tour, call
ROBERT HAUSSMANN,
Vice President for Corporate Development
(301) 225-8390.



The MRI Center offers physicians state-of-the-art diagnostic services with 24 hour report turn around and a voice retrieval system for instant access to dictated MRI reports from any telephone.



MGH

Maryland General Hospital
827 Linden Avenue
Baltimore, MD 21201

Newly renovated nursing station on a medical-surgical floor.

Maryland General Hospital is a 243-bed acute care facility serving the Baltimore metropolitan community for 108 years. Maryland General offers a comprehensive range of patient care services. We pride ourselves in the excellent quality in patient care and support services. Qualified professionals are dedicated to assisting the patient and family members during treatment and recovery. We provide this clinical support through the staff and services of many departments.

The Special Procedures Laboratory, dedicated exclusively to angiography, was designed in response to the needs of physicians to obtain superior diagnostic data in a timely manner.

Pathogenic Factors in the Development of Type I and Type II Diabetes Mellitus: 1990

Thaddeus E. Prout MD, FACP

Dr. Prout is Chairman, Department of Medicine, Greater Baltimore Medical Center and Associate Professor of Medicine, The Johns Hopkins University School of Medicine.

The pathogenesis of IDDM and NIDDM indicates a distinct difference between these diseases. Viral illness is implicated in IDDM, linked with evidence for an immune deficiency. NIDDM is not linked to viral illness or autoimmunity but is highly influenced by the inheritance of a defect in insulin production.

Diabetes mellitus consists of a group of disorders due to an absolute or relative insulin deficiency. Insulin dependent diabetes mellitus (IDDM), or Type I diabetes, makes up about 15 percent of all diabetics, and non-insulin dependent diabetes mellitus (NIDDM), or Type II diabetes, nearly all of the remaining 85 percent. A small number of patients have diabetes secondary to another primary disorder (e.g., hemochromatosis or chronic pancreatitis) which causes the decrease in insulin production. Consensus has now established the specific criteria for diagnosis that clearly define diabetes in all forms and effectively eliminate the confusion caused by terms such as "chemical diabetes" and "borderline diabetes." In this paper, the current concepts of the pathogenesis of the primary forms of diabetes will be described.

Insulin Dependent Diabetes Mellitus (IDDM)

IDDM typically begins with the rapid disappearance of circulating levels of endogenous insulin and decompensation of normal glucose metabolism. A later, brief, and inconstant period of insulin production called the honeymoon period may give fain hope to patients that the diagnosis is incorrect. This interlude has long intrigued students of the disease as a key to cause. Opie, working at the Johns Hopkins Hospital around the beginning of this century, described lymphocytic infiltrations of the pancreatic islet and suggested that this was evidence of an infectious process. An epidemic of diabetes following mumps, described in Norway over 60 years ago, added credibility to the belief that viral illness might be implicated in the development of diabetes. More recently, diabetes following vaccinations, the association of diabetes with the congenital rubella syndrome, and its long recognized seasonal fluctuations intensified the search for a virus as the causative agent of diabetes.

Work on the possible viral etiology of diabetes culminated almost 20 years ago when a virus isolated from the pancreas of a human subject dying of diabetes was shown to destroy cultured human beta cells in vitro, as well as to cause diabetes when injected

into normal mice. The search for a specific viral agent has shown that there are more than 20 strains capable of causing diabetes in test animals, and this has extinguished the hope that a single or small group of viruses might be used to create a specific vaccine for the prevention of this disease.

It is now recognized that lymphocytic infiltration of the islets is related not only to the development of diabetes following viral infection but also follows the experimental use of toxins that destroy beta cells in animals. This rediscovery of "insulitis" under these different circumstances has linked the lymphocytic infiltration to the destruction of cells and appears to be the proximate cause of diabetes in animals and human subjects.

The pathogenic events that ultimately cause diabetes may be multifactorial, and include molecular, cellular, genetic, and environmental contributors. These appear to have a common mechanism in autoimmunity. This theory is supported by several interlocking lines of evidence. With the onset of diabetes, there is frequently a concomitant rise in viral antibodies and insulin cell antibodies, and an abrupt fall in circulating levels of insulin. Genetic factors are supported by evidence that nearly 90 percent of patients with IDDM share one or more inherited specific markers among the human leukocyte antigens (HLA DR3 or DR4), as a result of which susceptibility to diabetes is increased fivefold over that of the normal population. When both of these markers are inherited, the susceptibility rises to 15-fold over that of the normal population. Other autoimmune diseases, especially autoimmune thyroiditis, is more common among both patients with IDDM and their first degree relatives. Recent work has suggested that susceptibility to IDDM seems to be highly attributable to the DQ locus as well.

In order to understand the steps involved in beta cell destruction, it is essential to understand immune theory as it relates to autoimmune disease. The responsible major histocompatible complexes, MHC, reside in man with the HLA on the short arm of chromosome 6. Also located on the short arm of chromosome 6 is a large group of interrelated physiologic factors that are designed to protect the host and to destroy foreign invaders. In this area are sites governing the actions of macrophages, the presenters of antigen to regulator lymphocytes for activation of the killer cell-helper cell system, as well as initiators of antibody production by the B cells. Intimately related with these destructive forces are the suppressor cells, one function of which is to prevent harm to host cells. It is the interplay of these balanced forces that normally allows the HLA system to destroy invaders without effect on host cells. Activation and presentation of an antigen from a host cell may then lead to production of cytotoxic cells and antibodies against the cell producing the antigen unless curtailed by suppressor cells. Present theory postulates that in patients with autoimmune diseases, the fundamental defect is a tilting of this imbalance toward the active destruction of the host cell producing the autoantigen and away from the suppression of self-destruction (Figure).

Within this complex mechanism are degrees of control, however, and it must be emphasized that all individuals who develop autoantibodies to the beta cell do not necessarily go on to develop diabetes. Evidence has been introduced that many individuals who develop antibodies to the islet cell may require months or years to develop evidence of glucose intolerance. Many first degree relatives of patients with IDDM may have antibodies with no demonstrable metabolic consequences. This also helps to explain the fact that monozygotic twins may be concordant for IDDM only 50 percent of the time in spite of genetic identity, whereas the genetic influence in NIDDM is concordant nearly 100 percent of the time.

The observation of this course of events opens up the possibility that agents might be found which can prevent beta cell destruction which could arrest or postpone for a significant period the development of IDDM. This is clearly one of the most interesting developments that has taken place in the field of IDDM and involves the use of cyclosporine and other drugs to interrupt this sequence.

The pharmacodynamics of cyclosporine are such that it has been the most widely tested drug in the prevention of beta cell destruction. It acts first by suppressing proliferation of cytotoxic cells and by decreasing antibody production. This effectively limits or prevents cell lysis and yet does not prevent phagocytic action by other cells. At the same time, suppressor cells are found to be relatively resistant to cyclosporine so that their action is preserved. The limitation of its effectiveness is related to frequent occurrence of renal toxicity. Discontinuation of medication immediately allows the destructive forces to again predominate, and the honeymoon period is ended.

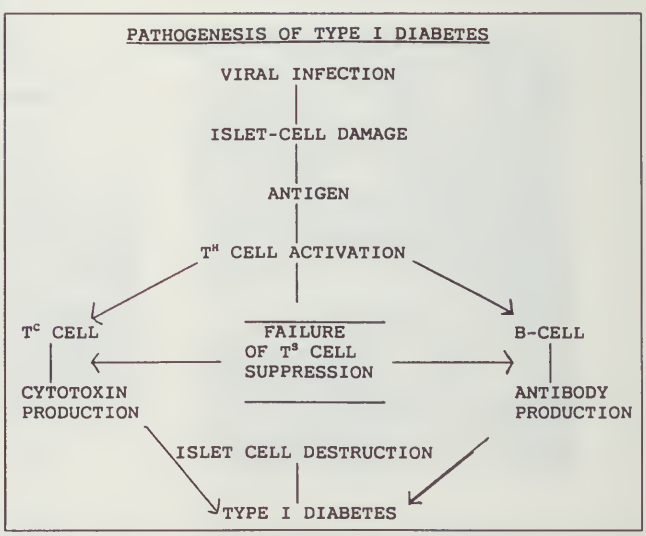


Figure. Destruction of the islet cells takes place whenever cytotoxic production or antibody production against these cells is unopposed by the suppressor cells.

Finally, the immunology of viral illness may also be useful in explaining the unfolding story of the epidemic of IDDM that is now being experienced worldwide. While the incidence of IDDM had been nearly stationary for the first thirty years of this century, the rate has nearly tripled in the last three decades. Nor can this alarming increase in insulin dependent diabetes be attributed to the propagation of offspring by the survivors of this disease following the use of insulin. It has been reliably estimated that a threefold increase by this mechanism alone would require at least 400 years to evolve.

It has also been noted that immigrants from Europe and the United States to Israel develop IDDM at a higher rate than do immigrants from Asia and Africa. This is also true of paralytic polio in nonimmunized patients. The explanation for this phenomenon is based on two observations. Polio in infancy confers immunity and at the same time has a more benign course than does polio in later life. Since immunity comes earliest to individuals surviving crowded and unhygienic conditions, early immunity to viral illnesses in infancy may alter the pathologic sequelae of the disease which develop later in both polio and IDDM. The rising incidence of IDDM in the United States over the past several decades may be due, paradoxically, to the relatively uncrowded conditions here compared to other countries. At present, the incidence of IDDM in the United States is 18 times higher than in Japan and 3 to 4 times higher than in Israel. No other explanation has been put forward to explain this apparent contradiction.

Non-insulin Dependent Diabetes Mellitus (NIDDM)

NIDDM is usually but not invariably seen in the latter decades of life and is, by definition, not dependent on exogenous insulin as lifesaving therapy. The group that develops NIDDM is more heterogeneous than the group with IDDM, and is made up almost entirely of the individuals who have had the insidious deterioration of glucose tolerance over a long span of time with few symptoms and resistance to ketosis and ketoacidosis, but with acceleration of degenerative changes of the vascular system over those of nondiabetic individuals of the same sex, age, and socioeconomic status. While these individuals may eventually require insulin to normalize blood glucose or, less commonly, actually become "insulin dependent," they are still listed as NIDDM, qualified by the physiologic status (e.g., NIDDM, insulin requiring). In addition, NIDDM includes a small group of individuals who develop diabetes as adolescents or young adults with the NIDDM characteristics. These diabetes of youth" (MODY). It is of more than passing interest that this disease seems to be uniquely inherited as an autosomal dominant and has been reported to result in an increased incidence of cardiovascular disease at a relatively early age.

Individuals who show transient aberrations in glucose control but revert to normal, and those with normal glucose tolerance tests, are classified as "previous history of diabetes." Such individuals include those who have earlier developed gestational diabetes but may have later deterioration of glucose control. Approximately 25 to 30 percent of this group of patients, and others who have had early but nonspecific alterations of glucose tolerance, will develop NIDDM at a later time. Individuals with secondary diabetes (e.g., hemochromatosis or acromegaly) who need insulin are commonly classified both as to etiology and to physiologic status (e.g., diabetes secondary to hemochromatosis, insulin requiring). Within this heterogeneous group may reside the defect that contributes to the pathogenesis of the more typical patient with NIDDM.

The studies that reveal a higher concordance of diabetes in monozygotic twins with NIDDM than similar studies in IDDM were at first viewed with skepticism because of the ingrained conviction that IDDM was a more serious disease and hence more likely to be homozygous for diabetes. When results of genetic influence for diabetes in NIDDM were confirmed and accepted, a search for the genetic linkage in NIDDM was finally begun.

The genetic expression for NIDDM has its clearest physiologic manifestation as an impaired or suppressed insulin production capacity. The risk factors for expression of this deficit are those which are teleologically consistent with this hypothesis and place a greater stress on beta cell productive capacity. Risk factors include aging, obesity, multiparity, possibly physiologic stress, and a sedentary lifestyle. Secondary causes of diabetes do not necessarily inherit a limited insulin capacity. This may explain why only a minority of patients who have diabetes secondary to a hormonal excess (e.g., acromegaly or Cushing's syndrome), insulin resistance (e.g., acanthosis nigricans), or chronic pancreatitis become insulin requiring.

Other physiologic characteristics of NIDDM are less clearly related directly to an inherited characteristic and possibly are secondary to other environmental factors. These defects include tissue resistance, both in vitro and in vivo, a lowering of the insulin receptors, and a postreceptor resistance to insulin effect on intercellular metabolism. It is difficult to prove that these deficiencies are not due directly to hyperglycemia. Claims that oral hypoglycemic agents have a direct role in increasing the number or activity of insulin receptors, tissue resistance, or postreceptor intracellular metabolism must address this issue.

The genetic expression for insulin production has been located on the short arm of chromosome 11. The gene, now referred to as the *diabetes gene*, is expressed in the beta cell of the pancreas where the primary messenger RNA is processed to the messenger for proinsulin. Basic reviews of this complex subject are available which detail the specific steps in this process. The genetic code has been isolated and deciphered in

nondiabetic patients, as well as in patients with IDDM and NIDDM. The codes for insulin in all of the subjects have been found to be identical. Differences were seen, however, in an insertion in the chromosome preceding that for insulin itself. There, insertions of variable length are found more commonly in Type II diabetes than in Type I or in nondiabetic subjects. This area ("flanking 5' insertion") has been implicated, but not proven, in the defect in insulin production identified in NIDDM.

This genetic identifier has now been traced through three generations of Type II diabetic subjects. It has also been recognized, however, that some nondiabetic subjects have the aberrant insertions as well, and thus the precise importance of the flanking insertion remains controversial. Interestingly, this apparent contradiction may strengthen the evidence for the physiologic effect of the aberrant insertion. A recent study has demonstrated that nondiabetic patients who have inherited this aberration have above normal levels of glycosulated hemoglobin, unlike nondiabetic subjects without the aberrant insertion. This finding is at least consistent with the hypothesis that a decreased insulin secretory capacity follows this change.

Molecular and genetic research in diabetes have concentrated first on the region of the gene that controls initiation or promotion of the transcription of the insulin code and, ultimately, on the introduction of a cloned initiator-promoter into mammalian cells. Considerable success has resulted from these efforts. Cloned mouse cells programmed to produce human proinsulin have been injected intraperitoneally into immunosuppressed diabetic mice. After seven days, increasing levels of insulin with a concomitant drop in blood glucose have been reported. These experiments provide evidence that encoded mammalian cells can be demonstrated to function as producers of human insulin with physiologic significant effects on glucose metabolism.

Many problems must be solved between these early experiments and those which would allow encoding of, for example, the stem cell from the bone marrow of a specific patient with NIDDM and transferring these insulin encoded cells back into the original donor. Since the injected cells would be identified as self, this could presumably be done without need for immunosuppression. This would allow production of physiologically significant amounts of human insulin from an autologous source. Recent studies have shown that human cells have now produced human proinsulin in vitro. This gives one the vision of a new dimension in the future treatment of both IDDM and insulin requiring NIDDM.

Summary

A summary of the pathogenic spectrum for IDDM and NIDDM shows the distinct differences between these diseases. The viral initiation of IDDM is supported by the production of viral antibodies, viral recovery, and the production of diabetes in animals by viral transfer. This is linked with evidence for an immune deficiency manifested by failure of suppressor cells to prevent beta cell destruction. The likelihood of IDDM is highly correlated with the presence of specific HLA types, DR3 and DR4, carried on chromosome 6 and possibly other sites.

Type II diabetes is not linked to viral illness or autoimmunity but is highly influenced by the inheritance of a defect in insulin production carried on chromosome 11. Expression of this defect is associated with environmental factors, especially obesity, in which 85 percent of such patients develop NIDDM.

The quest for the pathologic basis for diabetes would be an empty though challenging intellectual exercise if it were not possible to see some preventive or therapeutic implications in this new knowledge. For Type I diabetes, cyclosporine has been used to demonstrate that suppression of the autoimmune response, while leaving other functions of immune protection intact, can limit destruction of the pancreas in individuals who are susceptible to IDDM. New and more effective agents for long-term use are now needed. Following the identification and isolation of the *diabetic gene*, it has now been possible to encode this in mammalian cells and to produce human insulin in tissue culture. Research is continuing to develop the capability of insulin production by encoding a patient's own cell line. Such a breakthrough could, of course, be a very important adjuvant to treatment of both IDDM and NIDDM, since the eventual key to the cure of diabetes must be by either preserving or providing new insulin secreting cells in the diabetic patient.

A New Strategy to Improve Patient Care

We help the physician by helping the patient help themselves

Health can be maintained by teaching patients good care habits. Especially for those with needs related to:

- diabetes including gestational diabetes
- weight reduction and maintenance
- dietary problems of all types
- stress management

Now the time consuming burden of patient training can be transferred from a busy practice to a competent health care team. A certified nurse educator, master trained dietitians and behavior counselors will return the patient well educated to their primary care physician.

Training Programs Include:

Diabetes Education

- 20-hour courses, children and adults
- glucose monitoring
- ambulatory insulin instruction
- diabetes and pregnancy
- gestational diabetes

Behavior Modification

- weight reduction and maintenance
- modified fasting: Optifast
- limited diets: Optitrim
- full food control: LEARN®
- stress management

Dietary Counseling

- all medical disorders

Call for an appointment and further information or have patients schedule a general metabolic assessment at 828-3296.

The St. Agnes Hospital Chest Pain Emergency Room and Early Cardiac Outreach Program *link the community and the Hospital*

IN THE HOSPITAL

The Chest Pain Emergency Room

The Chest Pain Emergency Room at St. Agnes is an eight-private-room unit attached to the general emergency service. It has a separate entrance so that paramedics can quickly bring patients directly into the facility. In addition to its highly advanced resuscitation area, the unit's eight rooms are set up to function as a coronary care facility independent of the hospital's Coronary Care Unit. Patients can be monitored and cared for in these rooms until the decision is made to either release them or admit them to the Coronary Care Unit, which is connected to the Chest Pain Emergency Room by a special elevator.

The staff of the unit is trained especially for the Chest Pain Emergency Room. The doctors and nurses combine expertise in emergency medicine and coronary care to provide care for the cardiac patients that goes beyond that of the ordinary emergency room.

If you would like more information on the Chest Pain Emergency Room or the Early Cardiac Care Giver Program, contact St. Agnes Hospital at **(301) 368-3217.** *We can also supply your community group with speakers on the Chest Pain Emergency Room or the Early Cardiac Care Giver Program.*

"If all 6700 hospitals in the USA had this program, we might see heart disease fall to second or third place.
No one can remember it ever being out of first place."

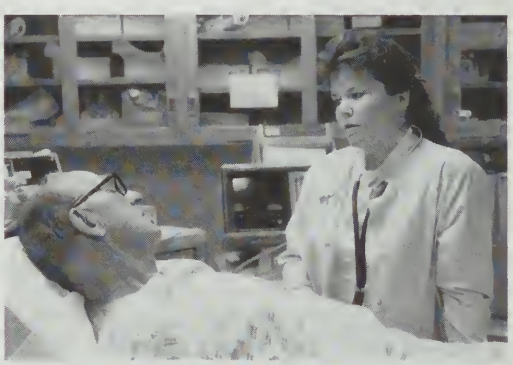
IN THE COMMUNITY

Recognizing the Symptoms of a Heart Attack



In Yourself

The most typical prodromal (early) symptom of a heart attack is recurring chest pain—a pain that is centrally located, comes on slowly, and increases in intensity as time goes on. This discomfort usually comes on with exertion and may disappear with rest. Most people experiencing these symptoms deny that anything is wrong. This denial can be harmful. Those who receive treatment in the early stage have an excellent chance of avoiding a heart attack and muscle damage. Those who do not receive prompt treatment risk their lives and their futures.

In Others

The most important step in saving lives is to get people with these symptoms to the Chest Pain Emergency Room before it's too late. This is the job of the *early cardiac care giver.*

You can become the critical link between the Chest Pain Emergency Room and a potential heart attack patient by becoming an Early Cardiac Care Giver. As such you'll learn how to spot the signs of an impending heart attack, and just as importantly, how to overcome a patient's denial and get him or her to seek prompt treatment. The St. Agnes Chest Pain Emergency Room can save lives—with your help.

Parvovirus and Epidemic Arthritis

Charles A. Haile MD

Dr. Haile is Medical Director for Infectious Diseases, Greater Baltimore Medical Center.

Five cases of acute polyarthritis in individuals with serologic evidence of recent human parvovirus B_{19} infection were seen in one medical practice. Several individuals had had direct exposure to children with rash, and fifth disease was endemic in the community. All cases were associated with the presence of both IgG and IgM antibody to human parvovirus.

Fifth disease or erythema infectiosum, a common benign infectious exanthem of childhood, has long been described in the medical literature and is familiar to all pediatricians. Outbreaks frequently occur in the spring and summer, and usually in children between the ages of five and fifteen. It often has a characteristic rash (diffuse erythema of the malar region) which has been called "slapped cheek syndrome."

The relationship of fifth disease to parvovirus B_{19} was established after the study of an outbreak of fifth disease in elementary school children in England (involving almost 600 cases) in which anti-parvovirus virus B_{19} IgM antibody was found in those individuals studied, but was not present in control cases.[1] A report of a similar outbreak in Manitoba, Canada, which had occurred in 1980, was published the following year. Human parvovirus was detected by DNA hybridization studies and immune electron microscopy, and confirmed by serologic investigation.[2] Until recently, little has been known about the clinical manifestations of this infection in adults. Nevertheless, early literature[3,4] suggested, on epidemiologic grounds, that occasionally, significant arthritis as well as debilitating fatigue and depression could occur in adults. It was observed, however, that adults exposed to children with fifth disease usually did not suffer major clinical illness. Because of the lack of commonly available diagnostic tests, as well as the lack of knowledge of parvovirus and its potential syndromes, it would seem that the illness is rarely diagnosed in adults.

Parvovirus Case Histories

The current cases are presented as cases of probable acute parvovirus infection since all patients had evidence of both IgG and IgM anti-parvovirus B_{19} antibody in serum specimens obtained one to three weeks after their initial symptoms (Table 1).

Septicemic-like

Case 1 B.S. is a 58-year-old white female who became acutely and severely ill with generalized joint pain and swelling, fever, and

skin rash in mid-June 1987. The patient was admitted to a local hospital with suspected Rocky Mountain Spotted Fever. At the time of admission, the patient was not able to get out of bed because of pain and joint swelling, and was brought to the hospital via ambulance. The rash was red and raised; it was most prominent on the extremities. The arthritis involved multiple joints including hands, knees, and ankles. The patient instructed children in her home. However, none of the children were ill or were noted to have rash. Rocky Mountain Spotted Fever was ruled out serologically, and the patient gradually improved over a one- to two-week period. The patient reported four months later that her symptoms had recurred four or five times with generalized joint aches and bad temper, but in general she had returned to normal. At six-month and two-year follow-up, the patient was doing well without related complaints.

Prolonged Fatigue, Arthralgia, and Depression

Case 2 M.H. had been complaining of fatigue and low-grade fever approximately two weeks before becoming acutely ill in mid-April 1987. At about the time the patient became ill, her two children were noted to have a generalized macular rash. One of the children had a classic "slapped cheek syndrome." A number of playmates of the children had recently been diagnosed as having fifth disease.

Over a 48-hour period, the patient noted fever to 102° and migratory polyarthralgia involving sequentially the shoulders, small joints of the hands, wrists, elbows, ankles, and knees. The patient used aspirin and Indomethacin without improvement. On examination at the initiation of the illness, there was obvious swelling and redness of the small joints of the hands, as well as ankles and knees. Sedimentation rate was elevated to approximately twice normal, but rheumatoid factor and ANA were negative. Piroxicam was prescribed with much symptomatic improvement in joint swelling. Nevertheless, the patient continued to have severe arthralgia and almost incapacitating fatigue for a period of six weeks. At the two-month follow-up, the patient was not able to perform her usual household chores and seemed depressed. At the six-month follow-up, the patient continued to complain of severe *episodic* arthralgia and fatigue. A tricyclic antidepressant was prescribed by a psychiatrist without much benefit. A two-year follow-up revealed that the patient continued to complain of easy fatigability and episodic arthralgia, but was able to perform her usual daily functions.

Case 3 L.H. is a 40-year-old white female who became ill in early April 1987 with complaints of frontal headache, sore throat, and arthralgia. Within 48 hours, the patient developed a diffuse maculopapular rash prominent on the hands and thighs. Although there was no tick exposure history, the patient was begun on tetracycline because of the concern of possible Rocky Mountain Spotted Fever. Nevertheless, the patient continued to be ill, and acute and convalescent Rocky Mountain Spotted Fever serology was negative. The

Table 1. Characterization of Patients

	Case 1 BS	Case 2 MH	Case 3 LH	Case 4 MB	Case 5 EB
Sex	F	F	F	F	F
Age	58	37	40	44	40
Acute Serum Antibody	IgG+	IgG+	IgG+	IgG+	IgG+
to Parvovirus B_{19}	IgM+	IgM+	IgM+	IgM+	IgM+
Timing of Serum (after initial symptoms)	3 weeks	2 weeks	2 weeks	2 weeks	1 week
Rash	Yes, generalized including palms and soles	Yes, transient face only	Yes, recurring face, hands, thighs	Yes face, palms	None
Exposure History	Teaches children	Both daughters had rash, one with "slapped cheek syndrome"	None	Schoolteacher	Both daughters had rash near time of illness
Arthritis	Hands, knees, ankles	Migratory, especially hands, knees Persistent generalized achiness	Hands, knees, ankles Persistent generalized achiness	Hands, knees, ankles	Hands, knees, ankles
6 Month Interview	Healthy	Fatigue, depression, episodic complaints	Fatigue, depression, episodic complaints	Healthy	Occasional arthralgias
2 Year Interview	Healthy	As above	As above	Healthy	Healthy
Liver Function Test			SGPT 117 (0-50) SGOT 55 (0-50) Alk. Phos. 192 (35-130)		
Sedimentation Rate	N.D.	45 (0-20)	42 (0-20)	25	N.D.
Rheumatoid Factor	N.D.	Negative	Negative	Negative	N.D.
Antinuclear Antibody	N.D.	Negative	Positive 1:40	Negative	N.D.
Loss of Time from Work	2 weeks	3 weeks (unable to perform duties fully for 3 mos.)	6 weeks (unable to perform duties fully for 3 mos.)	1 day	None
Initially Confused with Rocky Mountain Spotted Fever	Yes	No	Yes	No	No

patient had moderate erythema of the face and evidence of moderate swelling of multiple joints, including fingers, knees, and ankles. Eventually, the patient saw a rheumatologist and was placed on Naproxen with symptomatic relief. Because of fatigue and arthralgia, the patient was unable to work for more than a six-week period of time, but gradually after two months was back to work on a half-time basis. Rheumatoid factor and antinuclear antibody were negative, and the sedimentation rate was elevated to twice the upper limit of normal. At six-month and two-year follow-up, the patient continued to complain of fatigue, depression, and episodic arthralgia, and continued to require the use of Naproxen.

Acute, Transient, Self-Limited Arthritis

Case 4 M.B. is a 44-year-old schoolteacher who first became ill in early June 1987 with fatigue and then transient rash of the thighs and calves. The patient complained of extreme fatigue and then developed painful swelling of the hands, knees, and ankles. On examination, there was evidence of a mild, malar rash with moderate swelling of the fingers, especially around the MCP joints. The palms were markedly erythematous, and the knees and ankles were also modestly swollen and warm to the touch. The patient felt dramatically better after ibuprofen was instituted, and after a period of approximately ten days felt entirely well. She has remained well.

Case 5 E.B. is a 40-year-old white female seen in late May 1987 with complaints of a two-week history of headache, chilliness, fatigue, and migratory arthralgia. On examination, there was evidence of enlarged cervical lymph glands, with moderate swelling and pain on motion of the knees. At two-week follow-up, the patient continued to complain of a debilitating intermittent pain and swelling of the knees and ankles. The patient self-medicated with ibuprofen with some relief. At two-month, six-month, and two-year follow-up, the patient was well.

Results

Five cases of acute polyarthritis associated with serologic evidence of acute parvovirus B_{19} infection are described. All patients were seen in one small medical practice within a two-month period of time. All patients were women with ages clustering in the fourth decade. Several had exposure to children with rash. All patients had serum drawn during the acute phase of their illness, varying in time from one to three weeks after the onset of symptoms. Serologic testing was performed at the Centers for Disease Control, Atlanta, Georgia, Department of Virus Diseases, by an enzyme-linked immunosorbent assay using the indirect antibody capture method.[5] The original antigen for this assay was harvested from a patient in aplastic crisis with high titered parvovirus B_{19} viremia. (Cutoffs for positive and negative sera had been previously established by studying populations of patients with fifth disease, aplastic crises, and a variety of other nonrelated medical illnesses and other controls.)

Four of the five patients had rash, in which involvement of the hands (especially palms) was noted in three. In several patients, the diagnosis of Rocky Mountain Spotted Fever was clinically suspect but subsequently ruled out by serologic testing. Arthritis, especially involving hands, knees, and ankles was noted uniformly.

Significant disability, as manifested by loss of time from work or usual occupation, was noted in two patients. These patients were unable to return to full-time activity until approximately three months had passed. Both patients continued to complain of episodic depression, arthralgia (without overt signs of arthritis), and fatigue for more than two years after their initial symptoms. Both patients continue to require maintenance therapy with nonsteroidal anti-inflammatory drugs for arthritic symptoms three years after their initial symptoms. (They had not used or required these drugs prior to becoming ill). One patient had evidence of a mild hepatitis as manifested by elevated transaminases and alkaline phosphatase. The patient lacked symptoms and signs of hepatitis however, and the chemical profile returned to normal within a six-week period of time.

Discussion

There is much evidence that parvovirus B_{19} was the responsible agent for the illnesses occurring in these individuals.

Parvovirus infection, as manifested by fifth disease, was being diagnosed frequently in the community at the time. A number of the individuals who became ill were exposed to children with rash, and several of the children had actually been diagnosed by their pediatrician as clinically having fifth disease. All of the patients studied had evidence of both IgG and IgM parvovirus B_{19} specific antibody present in serum specimens obtained shortly after the onset of their illness.

The possibility that the parvovirus was a passenger virus and not responsible for the clinical symptomatology seems remote. Although it would have been optimal to have had control sera from other individuals in the medical practice run concurrently, this was not done. Nevertheless, the parvovirus assay performed at the Centers for Disease Control has been well standardized and employs appropriate positive and negative controls.[5] The uniform nature of the symptoms in the patients, the fact that parvovirus, as manifested by fifth disease, was endemic in the community at the time, and the uniform appearance of specific IgG and IgM antibody to parvovirus, strongly suggest that these were cases of parvovirus-induced disease. In several of the cases in which other etiologies were looked for diligently, no other pathogen (such as *Borrelia burgdorferii*, *Rickettsia rickettsii* or *rubella virus*) was noted. In the three patients who were tested serologically for acute rheumatoid arthritis, no

evidence for this was found. It is note-worthy that no further cases of acute polyarthritis with rash were seen in this medical practice in the ensuing two years following the initial two-month period.

It is my belief that these cases suggest a broad range of clinical expression of parvovirus infection in adults, ranging from acute, severe, incapacitating illness to acute, mild, self-limited illness to relatively severe and debilitating subacute illness to chronic illness.

Parvovirus Literature Review

Parvoviruses, dependoviruses, and densoviruses comprise the three genera of the family Parvoviridae. These viruses are small, non-enveloped, single-stranded, icosahedral DNA viruses.

Because of their size and low genetic information content, parvoviruses usually only code for a small number of structural proteins. Parvoviruses preferentially select rapidly turning over cells, such as activated lymphoid cells and gut epithelium, for replication. Parvoviruses have not, as of yet, been grown in classical tissue culture systems.[6]

The dependoviruses require co-infection with a helper virus such as adenovirus or herpes virus. As of yet, these have not been associated with human disease, although adeno-associated viruses have been isolated from humans. The densoviruses are autonomous viruses of insects. Parvoviruses are vertebrate viruses capable of autonomous replication. They have been associated with serious disease in animals (Table 2). Canine parvovirus and feline panleukopenia virus can cause severe gastroenteritis, central nervous system disease, and marrow hypoplasia, especially in young animals. Porcine parvovirus has been associated with stillbirth and abortion with intrauterine swine infection. Vaccines are in use for a number of these veterinary infections. As of yet, parvoviruses have not been implicated as causative agents of arthritis in animals.[7]

Aleutian mink disease, occurring in certain genetically susceptible strains of mink, is due to a parvovirus. This disease has, for a number of years, served as a model for human connective tissue diseases, especially systemic lupus erythematosis. Aleutian mink disease is a chronic, ongoing viral infection with high levels of circulating immune complexes with associated immune complex renal disease and vasculitis. Autoantibodies to DNA are present.[8]

As of yet, only human parvovirus B_{19} has been firmly associated with human disease. A parvovirus R_{A1} has been isolated from rheumatoid synovium in one study but its pathogenic role has not been proven.[9]

Human parvovirus B_{19} was found initially on electron microscopic examination of serum from asymptomatic blood donors showing false positive results on hepatitis B screenings.[10] These blood donors in whom the virus was initially seen by electron microscopy were asymptomatic, and for a number of years, the human parvovirus was an orphan virus (a virus in search of a disease). Nevertheless, seroprevalence studies documented that up to 60 percent of adults showed detectable specific anti-parvovirus B_{19} IgG antibodies.[11] In screening studies performed in the early 1980s, parvovirus B_{19} antigen was found in the serum of several children with sickle cell anemia in aplastic crisis.[12] This relationship has been sustained, and parvovirus B_{19} is known to be the common cause of aplastic crisis in sickle cell disease,[13] and other hemoglobinopathies and hemolytic anemias.

Experimental parvovirus B_{19} infection has been induced in humans.[14] A small number of adult volunteers agreed to be inoculated through the nasal route with human parvovirus obtained from an asymptomatic blood donor. Four of the five nonimmune volunteers developed high titered viremia in the second week after challenge during which time a mild systemic illness occurred. During viremia, reticulocytes disappeared from the peripheral blood, and hemoglobin fell. This would be expected from an agent that preferentially replicates in erythroid precursors. Neutropenia, lymphopenia, and thrombocytopenia were also noted. Approximately 2.5 weeks postinoculation, a second-phase illness associated with rash and arthralgia occurred in three of the four infected volunteers. Viremia was not demonstrated at this time. At the time of the arthralgia, the patients had developed both IgG and IgM antibody to the parvovirus. The rash was described as being maculopapular and usually involving the limbs and trunk. Arthralgia or arthritis characteristically lasted only several days, although no long-term details were provided in this study. These symptoms are typical of those seen in natural infection in the adult. Since viremia is not detectable at this point, it is possible that these manifestations may occur on an immunologic basis rather than by active virus replication.

A further study noted, by serendipity, that a child who had been in contact with an individual known to have parvovirus B_{19} viremia developed a diffuse rash.[15] Thus, it was suspected, and later shown, that this agent was the cause of the common childhood exanthem, erythema infectiosum.[2]

Further evidence for the relationship of this virus to arthralgia was documented when 42 cases of individuals with acute joint pain and serologic evidence of recent parvovirus infection were described in 1985. A rash was present in all three of the infected children, but in less than one-half of the adults.[16]

In a large retrospective study, more than 10 percent of patients attending an early synovitis clinic in Bath,

Table 2. Some Animal Diseases Associated with Parvovirus

Virus	Host	Symptoms and Signs
Canine parvovirus; Feline panleukopenia virus	cats, dogs	gastroenteritis, marrow aplasia
Porcine parvovirus	swine	intrauterine infection may lead to death
Mink parvovirus	Aleutian mink	"Aleutian mink disease" (autoimmune vasculitis)

England, were shown to have had recent serologic evidence of infection with parvovirus B_{19}.[17]

Seventeen of the nineteen patients described had arthralgia symptoms persisting for more than two months, and three of the patients had at least moderate symptoms for more than four years. Although the authors noted that the "persistence of joint symptoms was not associated with long-term joint damage or functional incapacity," they did point out that the persistent signs and symptoms occurring in three of the cases "would have fulfilled the Rheumatism Association's diagnostic criteria for rheumatoid arthritis." Nevertheless, all of the patients were seronegative for rheumatoid factor.

Most convincing, perhaps, is the recent report of a controlled clinico-epidemiologic study which seems to outline the spectrum of disease related to parvovirus B_{19} in adults.[18] Over 95 percent of the 475 adults who had been in contact with school children in a community undergoing an outbreak of erythema infectiosum were questioned or studied. Fifty-four adult cases of recent infection were serologically confirmed (Table 3). Although 14 of the adults were asymptomatic, 32 described an "influenza-like illness." In 26, an acute polyarthropathy was noted. This polyarthropathy was far more common in women than in men and lasted for up to seven months. Adults without serologic evidence of recent parvovirus B_{19} infection served as a control population. In infected individuals, the polyarthropathy was rather striking and involved predominantly the hands, knees, and ankles. Most of the adults with rash did not have a classic "slapped cheek" appearance. The rash often involved the palms or soles (in 10 of 24). The rash was also often recrudescent, seemingly precipitated by heat or emotion. Arthralgia occurred twice as commonly in women as in men (59 percent vs 30 percent). The onset was often dramatic with individuals going to bed feeling well, but on awakening, "hardly able to get up because of pain or stiffness." The authors described an arthritis rather than arthralgia, with joint swelling and stiffness in addition to pain, in a majority of cases. In this series, the arthropathy was persistent or recurrent for greater than two months in 20 percent of those with joint symptoms, and all of these were women. Occasionally, the arthropathy occurred in the absence of rash or other "influenza-like" symptoms, indicating that unless sought for, an infectious etiology could be missed. None of the patients, however, were seropositive for rheumatoid factor. The authors speculated that parvovirus B_{19} is now a more common cause of acute arthropathy than rubella, due to the falling incidence of adult rubella infection. In addition, the authors described an 11-year-old boy with a persistent arthritis for more than seven months, which was clinically suggestive of juvenile rheumatoid arthritis.

Table 3. Joint Involvement in 40 Adults with Acute Human Parvovirus Infection and Arthropathy

Pain (%)		Swelling (%)
8	Head	0
31	Neck	0
42	Shoulders	4
8	Chest	0
50	Elbows	12
58	Wrists	19
69	Hands	58
8	Hips	0
75	Knees	19
69	Ankles	35

In one controlled clinico-epidemiologic study of 54 adults showing evidence of recent parvovirus infection, approximately 75% experienced pain, joint swelling or both.

Modified from Woolf AD, Campion GV, Chishick A et al. Clinical manifestations of human parvovirus B19 in adults. Arch Intern Med 1989;149:1153-1156.

The current study, although uncontrolled, corroborates the wide spectrum of disease that may be associated with acute parvovirus B_{19} infection in adults.

Clinical outcome also may be related to age, immunologic status, and sex in that arthralgia is more common in women than in men and significant arthritis is unusual in children but not rare in adults.

Children characteristically have little if any morbidity with the virus, and in fact the rash is often confused with heat rash in the well-appearing child. It would appear, however, from the literature cited, that infection in adults is usually symptomatic. Although nonspecific influenza-like symptoms may be most common, arthralgia occurred in 59 percent of the women and 30 percent of the men in the clinico-epidemiologic study cited.

Infection occurring in pregnancy has resulted in fetal death, spontaneous abortion, and hydrops fetalis.[19] Nevertheless, it has been estimated that the risk of fetal death (after exposure of pregnant women to fifth disease at daycare centers or within households) is probably no greater than one to two percent.[20] Moreover, case control studies suggest that parvovirus is an uncommon cause of fetal death in the general population.[21]

Chronic B_{19} infection of red blood cell precursors in immunocompromised patients leading to severe refractory anemia has been described in a number of clinical situations including acute leukemia, bone marrow transplantation, congenital immunodeficiency, and AIDS.[22] Intravenous immunoglobulin therapy has been palliative in at least one patient.[23] For a summary

Table 4. Human Disease Associated with Parvovirus B_{19}

	Frequency
Fifth Disease	very common
Acute arthralgia/arthritis	common
Chronic arthritis	??
Disease of the fetus (especially hydrops fetalis)	uncommon
Transient aplastic crisis in those with chronic hemolytic anemia	The common cause of aplastic crisis in this setting
Refractory anemia in the immunocompromised individual (may be responsive to IV immunoglobulin)	very rare

of diseases with which the virus has been associated in humans, see Table 4.

It is of interest that in the five cases reported herein, three had a personal or family history of rheumatic disorder. Two of the individuals themselves had a prior history of rheumatic fever, and one of the individuals had a family history of rheumatoid arthritis. In a previous study, two-thirds of individuals with persistent arthritis following human parvovirus infection were HLA-DR positive, compared to approximately one-third in a control population.[24] Thus, an underlying genetic predisposition to arthritis may be present.

Although elevation of the sedimentation rate, as seen in the current report, has been noted with acute parvovirus infection, few other laboratory abnormalities have been noted in the literature. In at least one case in the literature in which arthrocentesis was performed, the synovial fluid was described as being lymphocytic, with approximately 15,000 white cells per milliliter.[25]

In the current report, one of the individuals described had modest elevation of liver transaminases and alkaline phosphatase (Table 1), which subsequently normalized, with the absence of serologic evidence for classic hepatitis A or B. This patient also underwent a skin biopsy of her rash (upper arm) which was histologically "consistent with urticaria."

Although the literature describes four cases of rheumatoid arthritis, the onset of which was concurrent with serologic evidence of recent parvovirus B_{19} infection, the presence of rheumatoid factor in these cases seems to have been transient in most, and any casual relationship remains speculative.[26]

The pathophysiology of human parvovirus-induced arthritis is far from clear. Although there is one case report of human parvovirus B_{19} DNA (using the Dot-Blot hybridization technique) in the synovial fluid of a patient with acute arthritis of the right knee,[27] most speculation has centered around an immunopathologic etiology for the arthropathy,[28] and this would seem to be most consistent with the human experimental data previously cited.

MRI UPDATE

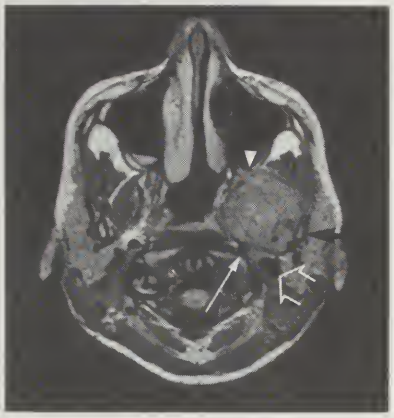

Figure 1

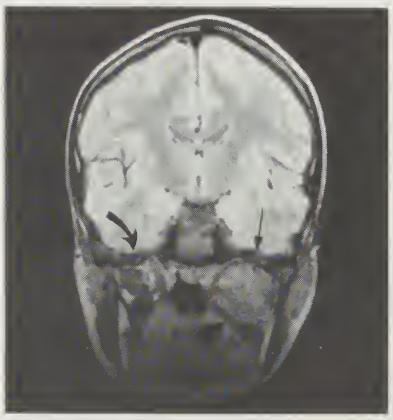

Figure 2

CLINICAL INFORMATION: This is a 14-year-old male with headache and left jaw pain.

FINDINGS: The axial image (figure 1) demonstrates a 4 cm. mass centered in the left parapharyngeal space. It deforms the left nasopharyngeal wall, but the fat plane between the nasopharyngeal wall and the mass indicates that the mass did not arise from epithelium there. The mass extends anteriorly through the pterygopalatine fossa to abut the posterior wall of the maxillary sinus (arrowhead), but it does not appear to invade the sinus. The mass extends laterally adjacent to the neck of the mandibular condyle (large arrow). It is separated from the deep lobe of the parotid by the deep branch of the facial artery. The mass is separated by fat from the internal jugular vein (open arrow). It abuts, but does not encase the internal carotid artery (long arrow). The coronal image (figure 2) demonstrates the mass effect of this large lesion (large arrow). Though the mass lies adjacent to the foramen ovale (small arrow) and appears to engulf an exiting branch of the mandibular nerve, it does not extend intracranially. The mandibular division of the fifth nerve lying just above the foramen ovale is shown on the normal right side (curved arrow).

COMMENT: MRI clearly demonstrates the size and extent of the mass in this difficult location. CT does not provide the multiplanar capability and soft tissue detail afforded by MRI which provides complete presurgical staging and analysis. The differential diagnostic possibilities must include juvenile angiofibroma because of the patient's age and sex. Paraganglioma and schwannoma were also considered possibilities. Mixed tumor arising from the deep lobe of the parotid could produce this appearance, but the lesion appeared to be separate from the deep lobe. The biopsy diagnosis was "sarcoma". Rhabdomyosarcoma in this area more commonly occurs in younger children.

MEDICAL MALPRACTICE DAZE

CHOICE

Medical Mutual Says They Offer It

Princeton Says They Offer It

And PIE Mutual Says They Offer It.

Of course they do. But depending upon *your* needs, the nature of *your* practice and all of those other intangibles that separate you from other physicians, don't you deserve the very *best* choice?

Of course you do. That's why it makes sense to deal with an Agent/Broker who puts *your* best interests first—someone who can place you in *any* of the three companies mentioned above.

If you are sincerely interested in making the best possible choice, don't you think the best possible place to start is by asking which Agent/Broker is best for you?

Cervical Spondylosis: A Therapeutic Update

Kenneth J. Murray MD, PhD; Albert H. Dudley, III MD and Howard Moses MD

From the Departments of Surgery and Medicine, Greater Baltimore Medical Center, where Dr. Murray is a neurosurgeon and neuro-oncologist, Dr. Dudley is an orthopaedic surgeon, and Dr. Moses is a neurologist.

Cervical spondylosis, also known as cervical osteoarthritis, is a common spine condition whereupon bone spur formation occurs.

Cervical spondylosis, also known as cervical osteoarthritis, is a common spine condition whereupon bone spur formation occurs. It is estimated that the central portion of the disc separating the vertebrae begins to show signs of deterioration in the third decade of life. Disc softening results in loss of the cushion effect between vertebral surfaces. This results in the narrowing of the interspace, allowing the vertebral surfaces to approach each other. With continued daily activity, osteophytes (bone spurs) can form and grow in size (Figure 1). Cervical osteoarthritis is extremely common and in most cases does not require surgery. Typical symptoms include neck and arm pain; numbness and weakness may follow. If the osteophyte is large enough, it can become centrally located and produce symptoms of spinal cord compression affecting leg mobility, including proximal leg weakness, spasticity, Babinski signs, and sensory impairment (Figure 2A). Osteophytes will continue to become more prevalent as individuals live longer. Sometimes existing spurs may not become symptomatic unless minor or major trauma occurs.

When neck and arm pain are present, medical therapies are employed in order to minimize vertebral body contact; a cervical collar is used to immobilize the cervical spine. In addition, muscle spasm, secondary to nerve root irritation, can be treated with physical therapy, muscle relaxants and anti-inflammatory agents. Typical time frames for treatment are 4-6 weeks. Cervical traction can be helpful at times, although some patients become more symptomatic. Cervical spine x-rays are essential in order to rule out associated fracture or infection. In addition, dynamic views are important in order to exclude vertebral body subluxation. Surgery is not required if there is less than 3mm of movement between vertebral surfaces.

The common triad of symptoms are pain, paresthesia, and weakness. Typically, as the nerve root recovers, the pain pattern improves, strength tends to be restored secondly, and last to improve is numbness. Often, facet injections, trigger point injections, and myofascial injections are helpful in supplementing the overall medical therapies.

In circumstances where patients show progressive neurological symptoms including progressive weakness, adjunctive tests become important. The MRI scan of the cervical spine has become a useful diagnostic tool. Improved resolution has permitted better visualization of the cervical spine axis, depicting the spinal cord, nerve root, disc material, and osteophyte formation, as well as providing precise measurements of the spinal canal and foramen. These observations permit a more scientific evaluation of patients who may need treatment. Basically, any patient with profound spinal canal stenosis who has failed medical therapy, would be a probable surgical candidate.

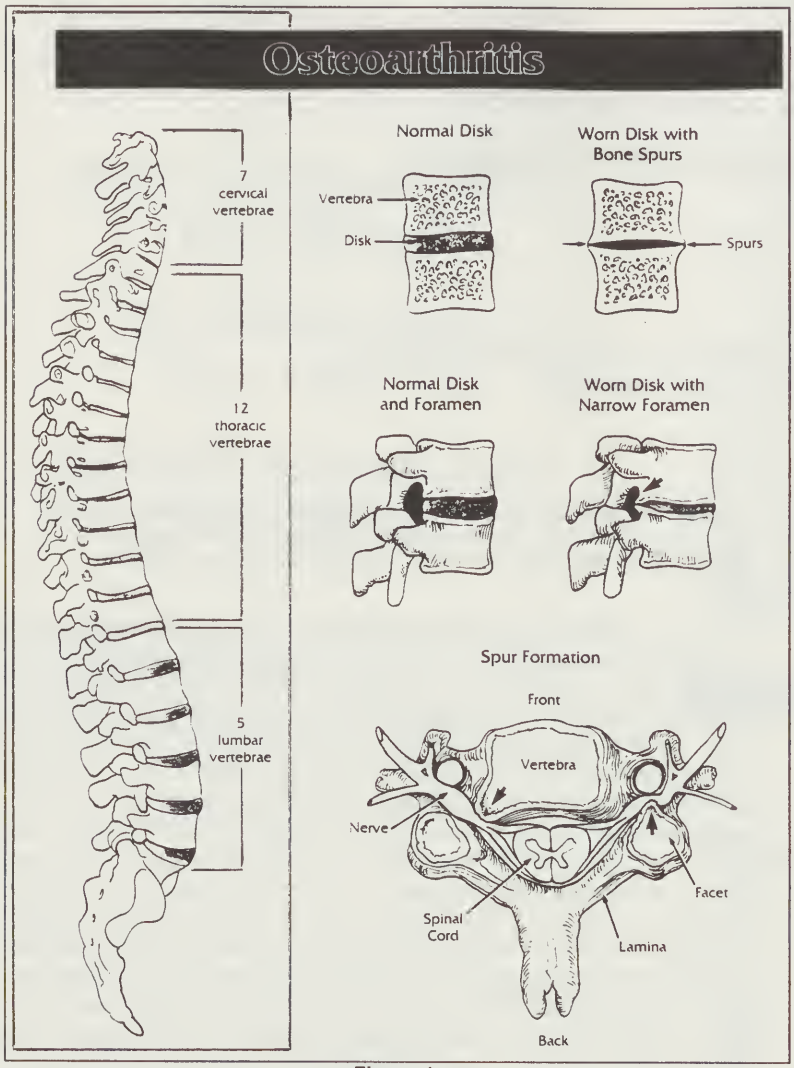

Figure 1.

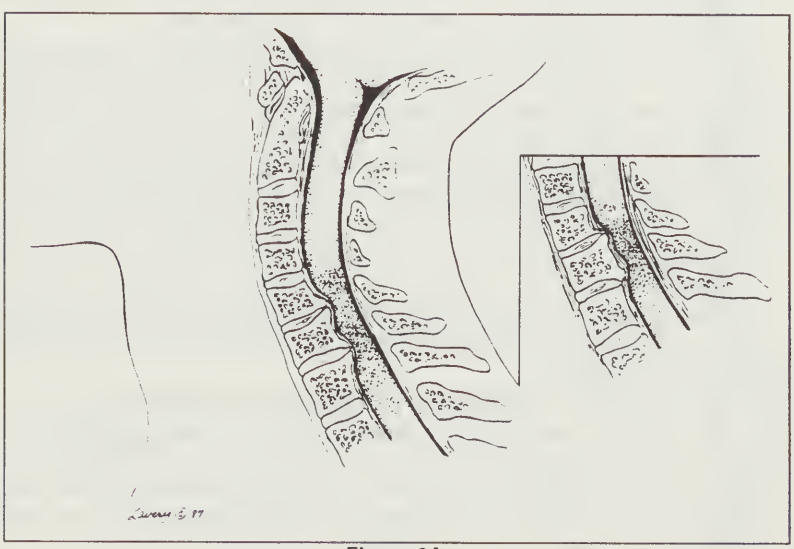

Figure 2A.

Traditionally, cervical laminectomies have been employed in the past by neurosurgeons in order to achieve decompression of the spinal canal by way of the posterior approach (Figure 2B). Because osteophytes are located on the anterior aspect of the spinal cord, laminectomy alone is not a direct surgical therapy for removing these compressive forces. The most direct treatments are the anterior operations described by Drs. Smith and Robinson,[1] and Dr. Cloward[2] in the 1950s. Their surgical approaches to the anterior aspect of the neck involved diskectomy, followed by fusion (Figures 2C and 2D, respectively). Because of limited visualization, vertebral osteophytes could not be routinely removed using these techniques. The Smith/Robinson procedure, however, proved to be extremely valuable in the surgical treatment of cervical spondylosis. Fusion alone prevented progressive osteophytic build-up since vertebral interspaces could no longer rub together. Unfortunately, the procedure itself did not consistently produce improved spinal cord function, although oftentimes, neck and arm symptoms were alleviated. Radiculopathy improved because the bone graft itself was oversized, as compared to the previous disc interspace, thus allowing increased height for the foramen and, subsequently, providing more room for the nerve as it exited the spinal canal. However, central compression did not generally improve.

In 1984, at Greater Baltimore Medical Center, a modification of the original Smith/Robinson operative procedure began to improve this methodology. During the past six years, approximately 478 patients have been treated using this improved surgical approach. The Murray/Dudley procedure consists of the use of a microscope and a high-speed diamond drill in order to directly excise osteophytes from the surface of the spinal canal (Figure 3A). Precise measurements are acquired by way of high-resolution CT scan myelograms. Osteophytic compression in a three-dimensional analysis can there-

fore be measured by CT scan myelography and applied at surgery. Because osteophytes are portions of the vertebral body, subtotal or total vertebrectomies are required. In most cases, the osteophyte resides at the inferior portion of the rostral vertebrae and the superior portion of the caudal vertebrae. Conventional diskectomy is performed in order to perform osteophytectomy. Direct visualization of the spinal canal occurs during resection of bone spurs and allows spinal cord decompression. The skeletal axis is then reconstructed by use of iliac bone struts tailored to fit the resected space created by vertebrectomy (Figure 3B). In over half of cases, patients harbor osteophytes at 2 disc interspaces. Large osteophytes require total vertebrectomy in order to fully decompress the spinal canal.

Clinical improvement of patients having cervical spondylotic myelopathy can be consistently accomplished with use of this operative approach. Pain improvement postoperatively was assessed by asking patients if they were satisfied with their surgeries from a pain standpoint. In addition, all patients were examined pre- and postoperatively by a medical neurologist and improvement was assessed by objective testing. The Table depicts patient improvement in 458/478 surgeries, i.e., 96 percent. Only one bone graft in this series failed to fuse. Average hospital stay is one to three days. Lightweight cervical collars are required for periods of ten to twelve weeks. Blood transfusion is rarely needed. Pain following surgery is minimal, and elderly patients tolerate the procedures well. Operating time averages 1.5 to 2.5 hours, depending on the number of levels involved in spinal cord compression.

In summary, cervical spondylosis is a common osteoarthritic condition which sometimes requires surgical therapy. The Murray/Dudley operative procedure has proven to be a useful surgical treatment for patients with this condition by reversing neurological deficits.

There comes a time in every physician's practice when automation is no longer an option...it is a necessity. Choosing a system is not a pleasure, it is hard work. If the future of your practice depends on excellent office automation, you have just found the solution in Medical Solutions Management, an office automation software package designed and developed by the Computer Services Department at the Medical and Chirurgical Faculty of Maryland. Physicians were consulted at every stage of the applications development to insure an easy-to-use and well-designed system. Medical Solutions Management offers every feature you could need or want, including instant record access, computerized 1500-form billing, appointment scheduling, and unlimited technical and training support. Your practice deserves the best. Call Medical Solutions Management.

Medical Solutions Management offers:

- ☐ Appointment scheduler
- ☐ Aging
- ☐ Day sheets
- ☐ Menu driven system
- ☐ On-line help manual
- ☐ Maintainance of patient demographics
- ☐ Insurance billing (1500 form)
- ☐ Walk-out superbill
- ☐ End-of-month bill
- ☐ Statistical reports
- ☐ Accounting reports
- ☐ Unlimited technical support
- ☐ Unlimited software upgrades
- ☐ Unlimited office staff training
- ☐ Automatic back-up and restoration
- ☐ Separate ICD-9 and CPT code databases
- ☐ Multiple diagnosis and procedure transactions
- ☐ Password protection to sensitive areas
- ☐ No annual fee for Med Chi members
- ☐ Clinical demographics

Role of the Community Hospital in Cancer Research

Gary I. Cohen MD and Margaret Tillett RN, OCN

Dr. Cohen is Director of the Cancer Center, and Margaret Tillett is a research oncology nurse at Greater Baltimore Medical Center.

We review here the historical development, rationale, and advantages of community hospital participation in controlled clinical trials, the primary source of reliable advances in the management of patients with cancer.

In 1971, President Richard M. Nixon declared war on cancer. Almost 15 years later, evaluation of data in the Surveillance, Epidemiology and End Results (SEER) program of the National Cancer Institute (NCI) showed that there had been no significant impact on the overall age-adjusted mortality rate in patients with cancer.[1] Despite this study, the impression of most oncologists is that great progress has been made. In fact, several cancers can be cured even in late stages with the use of chemotherapy.[2] Other advancements have been made in surgical techniques, radiation therapy, and methods of detection.[3] However, there has been no significant improvement in the diagnosis and treatment of the most common cancers, and this may have prevented any overall impact on cancer survival statistics. The NCI recognizes the importance of clinical trials in determining the optimal management of patients with cancer.[4] Traditionally, such research studies have been initiated and completed by major university centers. However, in 1990, 80 to 85 percent of patients with cancer are being treated in community hospitals.[5] The NCI has recognized that this patient population represents an important resource for accrual in clinical trials. Support from the NCI has resulted in the establishment of community clinical oncology programs (CCOPs), and numerous regional and national cooperative groups. The community hospital has become the centerpiece of data-generation for new clinical studies in cancer patients. Participation by oncologists at these institutions has exceeded expectations.[6,7] The opportunity for research into new aspects of cancer care should continue and flourish in the community hospital within the 1990s.

History and Status of Clinical Trials in Oncology

One of the first randomized controlled clinical trials in the medical literature was published in 1948 on the use of streptomycin for the treatment of tuberculosis. The results of the first clinical trial in cancer patients was published approximately ten years later. The National Surgical Adjuvant Breast Project (NSABP) was formed in the mid-sixties and became one of the first coopera-

tive oncology groups. The NSABP has completed numerous studies on the value of adjuvant therapy on breast cancer and colon cancer utilizing community physicians as the basis for entry of patients onto studies. The success of this cooperative group serves as a model for other national and regional groups to expand into the community setting.

Oncologists in clinical practice have the option of affiliating with numerous national protocol groups. The Eastern Cooperative Oncology Group (ECOG), Southwestern Oncology Group (SWOG), Radiation Therapy Oncology Group (RTOG), and Cancer and Acute Leukemia Group B (CALGB) are several of the more than 20 groups which have successfully transported their protocols to community hospitals. New groups originating in community hospitals have been formed. The North Central Cancer Treatment Group (NCCTG) initiated a pilot study using 5 FU and Levamisole for adjuvant therapy of resectable colon carcinoma.[8] This study was primarily conducted in nonteaching hospitals and showed a significant advantage for chemotherapy treatment following resection of colon cancer. The study was later repeated in a larger group of patients by the Mayo Clinic, and the results were identical.[9] In the report of this cooperative group trial published in the *New England Journal of Medicine*, the authors give credit to the developing role of nonuniversity hospitals in the treatment of cancer patients in the community setting.

Research Studies in Community Hospitals

Clinical protocols from national cooperative groups usually represent state-of-the-art therapy for malignancies. The development process for clinical protocols involves several levels of input ranging from full-time academicians to community physicians, nurses, statisticians, and protocol administrators.[10,11] Participation in protocol groups also establishes a direct link between researchers and clinicians for the rapid flow of new ideas and technology. Several studies have shown that patients who enter protocols receive better treatment and survive longer than non-protocol patients. Protocol patients from community hospitals do just as well as those at universities.[6,7] By extension, community hospitals which are involved in clinical studies should be providing a higher quality of care than nonaffiliated hospitals.

Despite some advantages for patient care, protocol therapy represents a liability to some practicing oncologists in the community. Busy practitioners have been reluctant to enter patients on clinical protocols because of the excessive time constraints of reviewing the study parameters and fully informing the patient regarding the treatment options.[12] Most protocols have extensive pretreatment requirements which must be fulfilled and may also have a randomization phase. More than 50 percent of patients may be disqualified because of protocol exclusions, such as abnormalities in laboratory tests, other concurrent medical illnesses, or timing of various pretreatment studies.[7] Patients may not readily understand the concepts of randomization and may refuse entry onto studies. Protocols usually include follow-up studies subsequent to the primary treatment in order to assess survival and long-term effects, and to accurately evaluate recurrence. In some cases, protocols may even demand studies not ordinarily required in the private practice setting, leading to increased costs of medical management and, in some cases, refusal of third-party payors to fund the costs of patient care for study participants.

Hospitals must make a financial commitment to facilitate entry of patients onto clinical studies. A data coordinator and a nurse oncologist who are familiar with treatment protocols and potential toxicities are an essential part of the oncology team. Data from the Association of Community Cancer Centers (ACCC) indicate that, over the past year, more than half of their member institutions placed 20 to 40 patients on protocols.[5] Almost half of ACCC member hospitals under 200 beds and 34 percent of 200 to 400 bed hospitals qualified for funds from the NCI under the CCOP program. However, recent funding constraints of the NCI may threaten the viability of some CCOP programs, jeopardizing data collection on thousands of potential protocol patients.

Role of the IRB

The institutional review board (IRB) serves a valuable purpose in reviewing studies for scientific merit and informed consent. The composition of a valid IRB is explicitly outlined by guidelines of the National Institutes of Health (NIH). Participation in an IRB is a time-consuming effort but is an essential ingredient of transporting research from academic centers to suburban hospitals. Every clinical research protocol has inherent liabilities related to justification of human experimentation. Most randomized clinical trials compare the relative merits of two accepted treatments for a given malignancy, but some protocols test new drugs which are not yet approved by the Food and Drug Administration (FDA). The scientific merit of these studies must be reviewed by both medical and lay members of the hospital community to be certain that the design is valid and acceptable, and that patients are fully informed about the benefits and potential risks.

Informed consent is essential to maintain human dignity in research studies. Patients are overwhelmed with complicated information and new terminology at a time when they are under immense stress due to the diagnosis of cancer. We expect them to make difficult decisions while they are trying to cope with drastic changes in lifestyle. All professionals involved in clinical trials are responsible for assessing patient comprehension.[13,14] This may be extremely difficult in randomized trials which assign patients to treatment or no-treatment arms. Yet, these studies are extremely important in determining the value of a specific therapy. Patients and physicians alike are often biased

toward a specific therapeutic approach prior to the establishment of proven efficacy. Decisions regarding scientific merit, study design, and eligibility involve not only scientific but also ethical considerations. These complex deliberations are often unfathomable to the patient who becomes a willing participant in a clinical trial, but medical investigators carry the responsibility of assuring that the patient understands the information he or she is given.[11-14]

Opportunity for Cancer Research in Community Hospitals

Progress in cancer treatment proceeds with small steps. Major advances in the laboratory may enhance our understanding of the neoplastic process but years may elapse before a clinical benefit can be derived. The major focus of research in the clinical setting is the procurement of new chemotherapy agents and the identification of new combination regimens. New drugs are being developed which have improved cytotoxicity, better selectivity for cancer cells, and decreased toxicity. In addition, oncologists now recognize the usefulness of multiagent chemotherapy which takes advantage of additive or synergistic effects. New methods of administration of chemotherapy drugs, and changes in schedule and dosimetry have also resulted in improved response rates for some cancers.[2]

More than 15,000 potential chemotherapy agents are patented every year.[15] However, most of these drugs are unsuitable as antineoplastic agents. Extensive preclinical testing is employed to identify those compounds which have potential cytotoxicity for cancer cells, with acceptable clinical toxicity. Only a handful of new drugs are brought to the clinic each year for further testing in humans.[15,16] The FDA has established three phases of clinical studies on human subjects in order to determine whether new drugs should be licensed as antineoplastic agents.

The first phase is purely for pharmacologic study in humans. These studies are usually performed on a limited number of patients who have previously been heavily treated with other chemotherapy agents and who have no other reasonable therapy available for their malignancies. Biochemical studies are usually performed to determine the drug half-life, bioavailability, and pharmacokinetics. Toxicity is carefully observed, and the acceptable dose for human subjects is determined. In Phase I studies, responses are not expected, and the only goal is to identify the maximum tolerated dose in man.[11]

Phase II studies are limited to patients with a specific type of malignancy who are treated with the standard dose determined in the Phase I studies. The goal is to determine the efficacy of new chemotherapy drugs. The patients have usually been treated less extensively in the past but still have tumors for which there are no known alternative effective treatments. Patients must have disease which is measurable (for example, an enlarged lymph node or pulmonary metastasis) so that response can be evaluated.

In the third phase of study leading to FDA approval, new drugs are used either alone or in combination with other agents and are compared to similar combinations with known effectiveness in randomized studies.

Community hospitals commonly participate in Phase III studies through national and local cooperative groups. Similar studies can reasonably be initiated and completed by well-trained oncologists in the community setting. Phase II studies are also occasionally performed by the national protocol groups. However, the early use of experimental agents requires careful screening of pharmacy and other hospital-related personnel to assure that appropriate dosing and reporting of toxicity are achieved.[7,10,12] Phase I studies are, therefore, usually carried out in university settings that have a specific interest in pharmacology and such studies should not be performed in most community hospitals (Table 1).

Role of the Nurse Oncologist

Thirty years of clinical trials have produced a large body of scientific knowledge. The role of the oncology nurse has advanced from bedside care to include administration of chemotherapy drugs, data collection, and more recently, research as an independent investigator.[16] The expanded role of nurses into clinical research incorporates skills of observation, assessment, and education, but maintains the important mandate as patient advocate. In this dual role as advocate and investigator, the oncology research nurse has the unique responsibility of assuring strict adherence to the protocol design, while monitoring the study for violations of human rights.[17]

Community hospitals which are committed to high quality care must employ oncology nurses for direct patient care. An ongoing program to educate the nursing staff regarding problems specific to oncology

Table 1. Research in the Community Hospital

Type of Investigation	Purpose	Adaptability to the Community Hospital
Phase I	Determination of maximum tolerable dose of experimental agent.	not usually
Phase II	Determination of effectiveness of new drug.	only as part of group trial
Phase III	Comparison of new drug with "standard"	YES
Pharmacology	New combinations of approved drugs	YES
	Pilot programs on new methods of administration	YES
	Testing of unapproved uses of FDA approved drugs (off label use)	YES
Technology	Testing effectiveness of new devices	YES

patients is also essential to assure effective cancer therapy in community hospitals.

Other Studies

In addition to studies on new cancer drugs, the community hospitals are well positioned to evaluate the effectiveness of palliative care. One advantage of community hospitals is their proximity to the population they serve. They can, therefore, specifically cater to various social and religious needs unique to their patient population. The ability to treat patients in a warmer, more intimate, nonacademic setting is a benefit for some terminally ill patients. Community hospitals are appropriately involved in new programs such as hospice, home infusion, and social support groups but must also take the lead in determining the effectiveness of these enterprises.

New programs to evaluate prevention of cancer by altering dietary habits, or by the use of medications (retinoids, carotenoids), or by promotion of effective screening programs to detect cancer, will require tens of thousands of patients followed for five to ten years. Therefore, these programs must be administered by local hospitals to assure appropriate accrual and follow-up.

Evaluating New Technology

Cancer medicine has become a technology-intensive specialty. New catheters and subcutaneous implanted ports permit long-term infusional therapy. Treatments which previously required extended inpatient hospitalization can now be effectively given to outpatients. Regional chemotherapy into arteries can be given using implantable subcutaneous pumps requiring filling every two to four weeks. Intractable pain can now be managed at home using continuous morphine subcutaneously or even by the intraspinal route. Monoclonal antibodies have been developed with greater selectivity for antigens on neoplastic cells. These antibodies can be used to follow the progress of cancer as serologic tumor markers, or they can be tagged with radiopharmceuticals to aid in the detection of residual disease. Conjugates of antibodies and cytotoxins may act as a magic bullet to attack neoplastic cells with lethal substances. New laboratory studies to evaluate prognostic factors (for example, flow cytometry) are easily performed in community hospitals. Lymphocyte subsets which specifically attack cancer cells can now be isolated, programmed for toxicity, and reinjected into patients.

Advances in technology can easily be tested in community hospitals. In fact, nonacademic hospitals are the most logical site to evaluate the overall impact of new discoveries on cancer care as administered by community physicians.

Research Assures Standard of Care

The most compelling reason for community hospitals to participate in oncology research is to further our knowledge about effective cancer therapy. However, assurance of a high standard of care is clearly an important secondary benefit. Protocols are designed by multidisciplinary teams of cancer specialists. National cooperative group protocols outline initial studies, specific treatments, modifications of treatment on the basis of toxicity, objective assessment of patients' response, and follow-up intervals. However, community hospitals should not limit their cancer studies to national protocols but must also emphasize investigation of palliative and supportive care.

Nurses can take an active role as primary investigators in studies designed to improve the quality of patient care. Direct involvement in the early stages of protocol development allows nursing interventions to become incorporated into the original design. In oncology patients, the major goal is to identify nursing interventions that will help to relieve suffering. In many cases, patient education alone may serve this function by improving understanding of the disease process and related symptoms. However, oncology nurses must also take a leading role in evaluating new treatment protocols for symptom management. Fatigue, nausea, vomiting, constipation, and nutritional factors are common problems requiring nursing intervention. Pain control, health education, and stress management are other oncology nursing priorities.[18] These research initiatives are not limited to academic hospitals and can appropriately be performed in community hospitals by motivated nursing personnel (Table 2).

Community hospitals are well-equipped to provide excellent patient care. In this country, new technological advances quickly move into the community hospitals from academic centers. University hospitals will continue to be the major source of new concepts and innovative technology, but these techniques should not be limited to such centers. Well-trained physicians are continually completing fellowships and moving to the community setting. The commitment of community hospitals to research will assure an increasing quality of care for the oncology patient in the community setting.

Table 2. Palliative Care Issues in Cancer Patients in Community Hospitals

Symptom Control	Patient Education
Pain	Stress Management
Nausea & Vomiting	Compliance with treatment
Stomatitis	Management of venous access devices
Nutrition	Management of infusion pumps
Constipation/diarrhea	Behavior modification
Infection	Decreasing cancer risk factors

ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

MARYLAND DIAGNOSTIC IMAGING CENTER

7120 Contee Road
Laurel, Maryland 20707

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

TO SCHEDULE APPOINTMENTS FOR YOUR PATIENTS, CALL US AT (301) 725-8995.

Because safety cannot be taken for granted in H_2-antagonist therapy

AXID®
nizatidine

Minimal potential for drug interactions

Unlike cimetidine and ranitidine,[1] Axid does not inhibit the cytochrome P-450 metabolizing enzyme system.[2]

Swift and effective H_2-antagonist therapy

- *Most patients experience pain relief with the first dose[3]*
- *Heals duodenal ulcer rapidly and effectively[4,5]*
- *Dosage for adults with active duodenal ulcer is 300 mg once nightly (150 mg b.i.d. is also available)*

AXID®
nizatidine capsules

Brief Summary. Consult the package literature for complete information.

Indications and Usage: 1. *Active duodenal ulcer*—for up to eight weeks of treatment. Most patients heal within four weeks.

2. *Maintenance therapy*—for healed duodenal ulcer patients at a reduced dosage of 150 mg h.s. The consequences of therapy with Axid for longer than one year are not known.

Contraindication: Known hypersensitivity to the drug. Use with caution in patients with hypersensitivity to other H_2-receptor antagonists.

Precautions: *General*—1. Symptomatic response to nizatidine therapy does not preclude the presence of gastric malignancy.

2. Dosage should be reduced in patients with moderate to severe renal insufficiency.

3. In patients with normal renal function and uncomplicated hepatic dysfunction, the disposition of nizatidine is similar to that in normal subjects.

Laboratory Tests—False-positive tests for urobilinogen with Multistix® may occur during therapy.

Drug Interactions—No interactions have been observed with theophylline, chlordiazepoxide, lorazepam, lidocaine, phenytoin, and warfarin. Axid does not inhibit the cytochrome P-450 enzyme system; therefore, drug interactions mediated by inhibition of hepatic metabolism are not expected to occur. In patients given very high doses (3,900 mg) of aspirin daily, increased serum salicylate levels were seen when nizatidine, 150 mg b.i.d., was administered concurrently.

Carcinogenesis, Mutagenesis, Impairment of Fertility—A two-year oral carcinogenicity study in rats with doses as high as 500 mg/kg/day (about 80 times the recommended daily therapeutic dose) showed no evidence of a carcinogenic effect. There was a dose-related increase in the density of enterochromaffin-like (ECL) cells in the gastric oxyntic mucosa. In a two-year study in mice, there was no evidence of a carcinogenic effect in male mice, although hyperplastic nodules of the liver were increased in the high-dose males as compared with placebo. Female mice given the high dose of Axid (2,000 mg/kg/day, about 330 times the human dose) showed marginally statistically significant increases in hepatic carcinoma and hepatic nodular hyperplasia with no numerical increase seen in any of the other dose groups. The rate of hepatic carcinoma in the high-dose animals was within the historical control limits seen for the strain of mice used. The female mice were given a dose larger than the maximum tolerated dose, as indicated by excessive (30%) weight decrement as compared with concurrent controls and evidence of mild liver injury (transaminase elevations). The occurrence of a marginal finding at high dose only in animals given an excessive and somewhat hepatotoxic dose, with no evidence of a carcinogenic effect in rats, male mice, and female mice (given up to 360 mg/kg/day, about 60 times the human dose), and a negative mutagenicity battery are not considered evidence of a carcinogenic potential for Axid.

Axid was not mutagenic in a battery of tests performed to evaluate its potential genetic toxicity, including bacterial mutation tests, unscheduled DNA synthesis, sister chromatid exchange, mouse lymphoma assay, chromosome aberration tests, and a micronucleus test.

In a two-generation, perinatal and postnatal fertility study in rats, doses of nizatidine up to 650 mg/kg/day produced no adverse effects on the reproductive performance of parental animals or their progeny.

Pregnancy—Teratogenic Effects—Pregnancy Category C—Oral reproduction studies in rats at doses up to 300 times the human dose and in Dutch Belted rabbits at doses up to 55 times the human dose revealed no evidence of impaired fertility or teratogenic effect; but, at a dose equivalent to 300 times the human dose, treated rabbits had abortions, decreased number of live fetuses, and depressed fetal weights. On intravenous administration to pregnant New Zealand White rabbits, nizatidine at 20 mg/kg produced cardiac enlargement, coarctation of the aortic arch, and cutaneous edema in one fetus, and at 50 mg/kg, it produced ventricular anomaly, distended abdomen, spina bifida, hydrocephaly, and enlarged heart in one fetus. There are, however, no adequate and well-controlled studies in pregnant women. It is also not known whether nizatidine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Nizatidine should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nursing Mothers—Studies in lactating women have shown that 0.1% of an oral dose is secreted in human milk in proportion to plasma concentrations. Because of growth depression in pups reared by treated lactating rats, a decision should be made whether to discontinue nursing or the drug, taking into account the importance of the drug to the mother.

Pediatric Use—Safety and effectiveness in children have not been established.

Use in Elderly Patients—Healing rates in elderly patients were similar to those in younger age groups as were the rates of adverse events and laboratory test abnormalities. Age alone may not be an important factor in the disposition of nizatidine. Elderly patients may have reduced renal function.

Adverse Reactions: Clinical trials of varying durations included almost 5,000 patients. Among the more common adverse events in domestic placebo-controlled trials of over 1,900 nizatidine patients and over 1,300 on placebo, sweating (1% vs 0.2%), urticaria (0.5% vs <0.01%), and somnolence (2.4% vs 1.3%) were significantly more common with nizatidine. It was not possible to determine whether a variety of less common events was due to the drug.

Hepatic—Hepatocellular injury (elevated liver enzyme tests or alkaline phosphatase) possibly or probably related to nizatidine occurred in some patients. In some cases, there was marked elevation (>500 IU/L) in SGOT or SGPT and, in a single instance, SGPT was >2,000 IU/L. The incidence of elevated liver enzymes overall and elevations of up to three times the upper limit of normal, however, did not significantly differ from that in placebo patients. Hepatitis and jaundice have been reported. All abnormalities were reversible after discontinuation of Axid.

Cardiovascular—In clinical pharmacology studies, short episodes of asymptomatic ventricular tachycardia occurred in two individuals administered Axid and in three untreated subjects.

CNS—Rare cases of reversible mental confusion have been reported.

Endocrine—Clinical pharmacology studies and controlled clinical trials showed no evidence of antiandrogenic activity due to nizatidine. Impotence and decreased libido were reported with equal frequency by patients on nizatidine and those on placebo. Gynecomastia has been reported rarely.

Hematologic—Fatal thrombocytopenia was reported in a patient treated with nizatidine and another H_2-receptor antagonist. This patient had previously experienced thrombocytopenia while taking other drugs. Rare cases of thrombocytopenic purpura have been reported.

Integumental—Sweating and urticaria were reported significantly more frequently in nizatidine- than in placebo-treated patients. Rash and exfoliative dermatitis were also reported.

Hypersensitivity—As with other H_2-receptor antagonists, rare cases of anaphylaxis following nizatidine administration have been reported. Because cross-sensitivity among this class has been observed, H_2-receptor antagonists should not be administered to those with a history of hypersensitivity to these agents. Rare episodes of hypersensitivity reactions (eg, bronchospasm, laryngeal edema, rash, and eosinophilia) have been reported.

Other—Hyperuricemia unassociated with gout or nephrolithiasis was reported. Eosinophilia, fever, and nausea related to nizatidine have been reported.

Overdosage: Overdoses of Axid have been reported rarely. If overdosage occurs, activated charcoal, emesis, or lavage should be considered along with clinical monitoring and supportive therapy. Renal dialysis for four to six hours increased plasma clearance by approximately 84%.

Definitive Irradiation Following Breast-Conserving Surgery for Early Stage Breast Cancer

Robert K. Brookland MD and Albert L. Blumberg MD

From the Department of Radiation Oncology, Greater Baltimore Medical Center, where Dr. Brookland is Head of the Division of Gynecologic Radiation Oncology and Dr. Blumberg is Associate Chairman.

Definitive irradiation following breast-conserving surgery for early stage breast cancer can be offered in a community cancer center and achieve excellent local control, survival and cosmesis. The results confirm the validity of patient choice in selecting this breast-conserving modality as an alternative to mastectomy for selected patients with stage I and II breast cancer.

The 1980s ushered in a new era in the management of early stage breast cancer. Increasingly, women are electing to avoid mastectomy, a decision based in part on the growing body of data demonstrating equal local control rates and overall survival when comparing this more radical surgery with breast-conserving surgery followed by radiotherapy. With the creation of the Department of Radiation Oncology at Greater Baltimore Medical Center in 1981, a consistent policy of primary breast irradiation following lumpectomy and axillary dissection was established. This analysis evaluates the results of this policy.

Methods and Materials

Between January 1982 and March 1987, 189 patients received definitive irradiation following conservative surgery for breast cancer. Two patients had metachronous presentation of bilateral breast cancers within this period, giving a total of 191 treated breasts. The median age was 55 years with a range from 36 to 90. Fifty-eight women were premenopausal at presentation, and nine were under 35 years of age. Patient characteristics are listed in Table 1. The histology was predominantly infiltrating ductal carcinoma, seen in 167 patients. Other invasive patterns included medullary (7), colloid (4), tubular (4), and lobular (2). Seven patients had pure intraductal disease without an invasive component. Histological features are presented in Table 2.

Treatment consisted of local excision with removal of all gross tumor. Patients with positive margins generally underwent re-excision of the tumor bed at the time of axillary dissection. Tumor size is outlined in Table 3. The axillary dissection was carried out utilizing a separate axillary incision. In fourteen patients, the axillary dissection was omitted, either due to relative medical contraindications or noninvasive disease. Thirty-nine patients (21%) were found to have axillary nodal metastases. Nodal status of the 177 women undergoing axillary dissection is summarized in Table 4. Ninety-six breast cancers were pathologically categorized as stage I, and 95 were stage II. The estrogen and progesterone

receptor status was evaluated unless specimen size (or rarely, preparation) did not permit accurate analysis. Results are shown in Table 5.

Breast irradiation was usually commenced 3-4 weeks following surgery. Megavoltage irradiation was administered with either Cobalt or 6MeV linear accelerator. Tangential opposed fields delivered a total of 5040 cGy to the entire breast. The tumor bed was boosted in all but four patients, using orthovoltage (19 patients), iridium implantation (54 patients), or electron beam techniques (114 patients). The axilla and supraclavicular fossa were treated to 5040 cGy in patients with invasive disease where the axilla contained metastatic nodal involvement or was unexplored.

Systemic therapy was administered to 40 patients. Thirteen women received hormonal therapy, 22 chemotherapy, and five received both. Although chemotherapy varied, most women received six cycles of Cytoxan, Methotrexate and 5-Fluorouracil with radiotherapy delayed until completion of the systemic treatment. Four patients were treated with Cytoxan and 5FU along with radiotherapy, with four cycles of CMF given upon completion of radiation treatments. One patient received Adriamycin instead of Methotrexate.

Patients were followed for a minimum of 36 months from completion of therapy, with mean follow-up 56 months. Four patients were lost to follow-up. Survival analysis was performed using the product limit method of Kaplan and Meier.[1] Survival figures were dated from time of completion of radiotherapy, and the sample unit was the patient (189 treated). For local control, the unit of analysis was the breast (191 treated). Cosmetic results were scored based on volume and symmetry, degree of resultant edema, fibrosis, and telangiectasia.

Results

Disease Control Local and regional control of disease was achieved in all but seven patients, or 96.4 percent. The breast was the only site of failure in five patients. An additional two patients developed local and distant recurrence in a synchronous fashion. The failure pattern is summarized in Table 6. Size, nodal, and receptor status were not helpful in distinguishing risk for local recurrence. In contrast, the site of first failure was distant in 75 percent of those who failed and, overall, 9.5 percent of our patients ultimately developed disseminated disease. There was a trend for an increased rate of distant failure in patients with large primary size. Node positive women had a 17.9 percent risk of distant failure in comparison to 6.5 percent for node negative patients. There were no isolated axillary failures in our series, including those patients in whom axillary dissection had been omitted.

Survival The five-year probability of survival for the entire study group was 95 percent, while the probability of five-year freedom from relapse was 89 percent. For pathologic stage I and II patients, the five-year survival figures were 96 percent and 95 percent, respectively, with a corresponding five-year survival free of relapse of 92 percent and 86 percent, respectively. Survival curves are illustrated in Charts 1 and 2. Two patients relapsed both in the breast as well as distantly; both have since died. All five of the patients with breast-only failure underwent salvage mastectomy and are currently alive and without evidence of active disease. A total of seven (3.7%) patients have died of their disease and four (2%) have died of intercurrent disease. Twelve patients (6.3%) are currently alive with disseminated disease and are receiving systemic therapy.

Cosmesis Cosmesis was judged to be good or excellent in 81.3 percent of evaluable breasts, fair in 15.9

percent, and poor in 2.7 percent. Further analysis by treatment technique demonstrated a statistically significant difference based on energy used for breast irradiation. While 35.3 percent of patients treated with Cobalt had a fair or poor cosmetic result, this decreased to 8.9 percent for those women irradiated with the 6MeV linear accelerator. A poor cosmetic result was seen in four of five patients (80%) treated with Cobalt therapy.

Complications Therapy was generally well tolerated. Most patients developed the expected acute radiation dermatitis, infrequently associated with a moist desquamation. One patient (0.5%) sustained osteitis with fracture in an irradiated rib. Three patients (1.6%) have experienced painful fibrosis of the breast. This resolved spontaneously in one woman, but two elected to undergo a simple mastectomy for relief of pain. Moderate to marked arm edema was observed in three patients.

Discussion

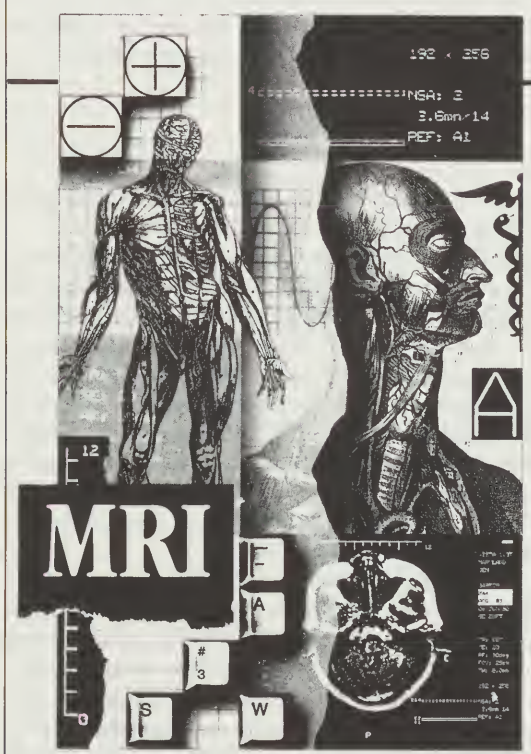
Over the past five years, several randomized prospective trials[2-4] have established that definitive breast irradiation following conservative surgery is equivalent to the modified radical mastectomy, both in achieving local control as well as in long-term disease-free survival. The impact of improved cosmesis, body image, and sexual function are important criteria not reflected in survival data which may, nevertheless, have a great impact on quality of life.[5-7] In offering this breast-conserving modality to our patients, it is essential to ensure that results of carefully controlled studies can be translated into the community setting without compromising control, cure, or cosmesis.

Our results permit just such a conclusion. Although our mean follow-up is less than five years (56 months), we have achieved a local control rate of 96.4 percent. This compares favorably with other series. Fisher et al[2] reported a 7.7 percent five-year and 10 percent eight-year recurrence rate following segmentectomy and breast irradiation but without a tumor bed boost in the NSABP randomized prospective trial. The series from the Joint Center for Radiation Therapy reported by Recht et al,[8] had a 5 percent and 14 percent failure for stage I and II. Solin et al[9] reported the University of Pennsylvania experience with a 6 percent overall five-year actuarial failure rate. Two randomized prospective trials[10,11] have reported local failure rates following modified radical mastectomy alone for T 1 and T 2 tumors at 10 percent and 21 percent at three and five years, respectively.

The five-year actuarial survival and disease-free survival of 95 percent and 89 percent, respectively, also compares favorably with other reported series. Solin et al[9] reported 93 percent five-year actuarial survival in 548 women and an 81 percent disease-free survival. This is among the best results in the literature. We believe these excellent results are the product of close communication between radiation oncologists, surgeons, and pathologists.

Re-excision of the tumor bed is carried out when there is concern about adequacy of the margins of resection. Careful follow-up has permitted all five patients with breast-only failure in our series to be rendered disease-free with salvage mastectomy.

Cosmetic results in the present series were similar to previous reports. Beadle et al[12] reported good or excellent cosmesis in 86 percent of their 243 irradiated breasts. Dubois et al[13] treated 392 patients and achieved cosmetic results judged by physicians to be good in 80 percent of treated breasts. It has been observed that physicians are more conservative in their scoring of cosmetic results than are patients, who judge the outcome as excellent or good in as often as 90 percent of cases. Again, attention to technical detail is critical in achieving cosmesis.[14]



In summary, our study demonstrates that definitive irradiation following breast-conserving surgery for early stage breast cancer can be offered in a community cancer center while achieving excellent local control, survival, and cosmesis. These results are equivalent to those reported at major academic centers and confirm the validity of offering women this breast-conserving modality as an alternative to mastectomy for selected stage I and II breast cancer.

THE MRI CENTER AT MARYLAND GENERAL HOSPITAL
A NEW RESOURCE FOR MARYLAND PHYSICIANS

Maryland General Hospital has installed a Picker Vista MRI 1.0 Telsa Scanner. This system permits high resolution, thin slice imaging capability and small fields of view, all with superior image quality.

Our System and services offer many benefits to area physicians...

- Convenient patient appointments.
- A dictaphone voice retrieval system which allows instant access to dictated MRI reports from any telephone including home, office or even car phones.
- A large magnet gantry and table to accommodate large or obese, and claustrophobic patients up to 300 lbs.
- Twenty-four hour or less report turn around.
- A financial counselor to facilitate MRI payments.
- Actual copy of study available to physician upon request.

The MRI Center at Maryland General Hospital
827 Linden Avenue Baltimore, Maryland 21201
301-225-8121

In the Matter of
James L. Hickey PsA
Before the Maryland Board of
Physician Quality Assurance

Findings of Fact,
Conclusions of Law, and Order

On June 23, 1989, the Maryland Board of Physician Quality Assurance (the Board) issued charges against James L. Hickey PsA (Respondent), a registered psychiatrist's assistant, under Health Occupations Article, Annotated Code of Maryland (H.O.) §14-302, and COMAR 10.32.04. Specifically, the Board charged Respondent as follows:

> Conviction of a crime involving moral turpitude, or the entry of a nolo contendere or guilty plea after having been charged with committing a crime involving moral turpitude; COMAR 10.31.04.02C(2)(c)
>
> Fraudulent or deceitful procurement or use of a registration; COMAR 10.31.04.02C(2)(g)
>
> Willfully making and filing false reports or records in his practice as a psychiatrist's assistant. COMAR 10.31.04.02C(2)(k).

Pursuant to its authority under State Government Article, Annotated Code of Maryland (S.G.) §10-207, the Board delegated its authority to the Hearing Office to hear evidence on the charges. A hearing on the alleged violations was held on February 1, 1990.

At the hearing, the State introduced the following exhibits without objection from Respondent:

> **State Exhibit 1:** Plea Agreement, consisting of four (4) pages.
>
> **State Exhibit 2:** Statement of Facts, consisting of six (6) pages.
>
> **State Exhibit 3:** Criminal Information, consisting of four (4) pages.
>
> **State Exhibit 4:** Docket Sheet, consisting of one (1) page double sided.
>
> **State Exhibit 5:** Charging Documents consisting of twenty-three (23) pages.
>
> **State Exhibit 6:** Respondent's Application to Work as a Psychiatrist's Assistant, consisting of two (2) pages.

The State called no witnesses and submitted its case on its documentary evidence and oral argument.

The Respondent offered no exhibits. Respondent testified on his own behalf and submitted his case based upon that testimony, the State's Exhibits, and his oral argument.

On February 14, 1990, the Hearing Officer issued a proposed Decision, including proposed Findings of Fact, Proposed Conclusions of Law, and a Recommendation to the parties. The parties were advised of their respective rights to file exceptions under S.G. §10-212. By letter dated March 20, 1990, the Board notified the parties that since no exceptions had been filed, the Board would consider the case on April 11, 1990. On April 11, 1990, the Board considered the recommended decision, and on the affirmative vote of a majority of its full authorized membership, the Board issues the following decision.

Findings of Fact

Based on the testimony and exhibits introduced at the hearing, the Board finds on an affirmative vote of a majority of its full authorized membership by a preponderance of the evidence on the charges issued under COMAR 10.31.04.02C(2)(c), (2)(g), and (2)(k) as follows:[1]

1. At all times relevant to this case Respondent was a psychiatrist's assistant registered with the Board.
2. Respondent pled guilty on March 1, 1989 in State of Maryland v. James Lee Hickey, Criminal Number 28904501, Circuit Court of Baltimore City, MD. No appeal was taken.
3. The crime to which Respondent pled guilty was to a one count information which charged Respondent with obstruction of justice in violation of Maryland Annotated Code, Article 27, §27.
4. The criminal information charged that Respondent did knowingly and willfully produce false and altered letters and documents to the Baltimore City Grand Jury and the Medicaid Fraud Control Unit of the Attorney General's Office in response to a subpoena duces tecum issued by the Grand Jury on March 8, 1988.
5. Obstruction of justice is a crime involving moral turpitude involving as it does, in this case, the alteration of documents to deceive a court of law.
6. The Respondent was sentenced, upon his plea, to five years of probation before judgment, on March 1, 1989. Respondent was ordered to perform 400 hours of community service.
7. The Respondent changed medical records, by his own admission.
8. The Respondent's right to practice as a psychiatrist's assistant and to create medical records was based upon his registration with the Board. The alteration of records was a fraudulent and deceitful use of Respondent's registration.

Conclusions of Law

Based upon the Findings of Facts, the Board con-

[1] Although factual findings must be supported by clear and convincing evidence for actions taken under H.O. §§14-504, 14-303, 14-303.1, and 14-303.2, there is no such requirement for actions taken against other allied health professionals. In the instant case, the standard of proof is preponderance of the evidence. The Board also has noted but rejects as not applicable in the instant case, *Everett v. Baltimore Gas and Electric Company*, 307 Md. 286, 513 A.2d 882 (1986). However, assuming *arguendo* that the standard of proof was clear and convincing, that degree of proof has been met.

cludes that Respondent committed the following prohibited acts:

Conviction of a crime involving moral turpitude, or the entry of a nolo contendere or guilty plea after having been charged with committing a crime involving moral turpitude; COMAR 10.31.04.02C(2)(c) and

Fraudulent or deceitful procurement or use of a registration; COMAR 10.31.04.02C(2)(g) and

Willfully making and filing false reports or records in his practice as a psychiatrist's assistant; COMAR 10.31.04.02C(2)(k).

Order

Based upon the aforegoing Findings of Facts and Conclusions of Law, it is this 16th day of July 1990,

ORDERED that Respondent's registration to practice medicine, that is as a psychiatrist's assistant, without being licensed is hereby

REVOKED; and be it further

ORDERED that this is a final order, consisting of eight (8) pages and as such is a public document pursuant to State Government Article of the Annotated Code of Maryland, §10-617(h)(2)(vi).

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

In the Matter of
Paul Daniel Miller DO
Before the Board of
Physician Quality Assurance

Order Reinstating License

By Order dated October 16, 1989 (the 1989 Order), the Board of Physician Quality Assurance (the Board) found Paul Daniel Miller DO (the Respondent) guilty of committing prohibitive acts as set forth in Health Occupations Article, Annotated Code of Maryland (HO) §14-504. Specifically, the Board found Respondent guilty of immoral conduct in the practice of medicine and failing to meet the appropriate standards for delivery of quality medical and surgical care HO §§14-504(a)(3) & (22). The Board revoked Respondent's medical license. The Order provided that after June 1, 1990, if Respondent demonstrated to the Board's satisfaction that Respondent had complied with certain recommendations, the Board would entertain a petition for reinstatement of Respondent's medical license. By letter dated June 1, 1990, Respondent petitioned the Board for reinstatement of his license to practice medicine in Maryland. At its meeting on June 27, 1990, the Board reviewed Respondent's petition for reinstatement. Based upon its review of the petition, the Board determined that Respondent had complied with the Board's recommendation contained in the 1989 Order, as follows.

Findings of Fact

Based on the information known and available to it, the Board finds that:

1. Respondent sought counseling and began treatment with Peter M. Hartmann MD in January 1989. Dr. Hartmann forwarded to the Board monthly reports on his sessions with the Respondent. In a reported dated June 7, 1990, Dr. Hartmann indicted that he believes that the therapy with Respondent has been successful. Dr. Hartmann recommended that the Respondent remain in therapy for at least two more years in order to maintain Respondent's progress.
2. Jesse M. Hellman MD, a psychiatrist selected by the Board, met with the Respondent on Wednesday, May 30, 1990 and on Monday, June 4, 1990 for interviews totaling three hours. In the report dated June 10, 1990, Dr. Hellman indicated that he believes that the Respondent will behave in an appropriate manner with his patients in the future, and will not repeat the behavior that led to the revocation of Respondent's license.
3. Respondent arranged to take a tutorial medical ethics course with Timothy J. Keay MD, MA - Theology, Assistant Professor in Division of Geriatrics, Department of Family Medicine, University of Maryland at Baltimore. The course followed the general outline of the Spring Medical Ethics Course taught to second-year medical students. Dr. Keay reported that the Respondent successfully completed the tutorial on Medical Ethics.
4. As of June 11, 1990, there are no other cases against the Respondent.
5. There is no evidence that Respondent is a present threat to the public health, safety and welfare.

Conclusions of Law

The Board concludes, as a matter of law, that Respondent has satisfactorily complied with all conditions recommended by the Board as conditions precedent to Respondent's petitioning the Board for reinstatement of his license as set forth in the Order of October 16, 1989.

Order

Upon the foregoing Findings of Fact and Conclusions of Law, it is this 11th day of July 1990 by a majority vote of the full authorized membership of the Board

ORDERED that effective as of the date of this Order that Respondent's license to practice medicine in the state of Maryland be REINSTATED; and be it further

ORDERED that Respondent is placed on PROBATION subject to the following conditions:

1. Respondent shall be required to remain in psychotherapy with Dr. Hartmann for two (2) years

from the effective date of this Order and comply with all reasonable recommendations of Dr. Hartmann;

2. Respondent shall immediately sign a release in order to allow his therapist to submit quarterly reports to the Board and to permit the therapist to report to the Board if Respondent misses an appointment without cause and/or is not following the therapist's reasonable recommendations;

3. Upon discharge from the therapy, Respondent shall arrange for the therapist to submit a final report to the Board indicating that Respondent has satisfactorily made progress in treatment and that the therapist has recommended that Respondent be discharged;

4. In the event that the Respondent terminates therapy prior to discharge by the Respondent's therapist, the therapist shall immediately notify the Board that Respondent has left therapy without consent of the therapist; and

5. Respondent shall be evaluated by a Board-selected therapist twice during the probationary period, on or about June 1, 1991 and June 2, 1992; and be it further

ORDERED that after two (2) years after the effective date of this order, the Board will entertain a petition for termination of Respondent's probationary status and reinstatement of Respondent's license to practice medicine in Maryland without any conditions or restrictions whatsoever. If the Respondent has complied with all conditions of probation and if there are no outstanding complaints against Respond-ent, the Board will reinstate the Respondent's license without any conditions or restrictions whatsoever; and be it further

ORDERED that if the Board receives a report that Respondent has had a sexual relationship with a patient or that the therapist reports that Respondent is an imminent danger to the public safety, health or welfare, the Board, without prior notice and an opportunity to be heard, may immediately suspend Respondent's license, provided that Respondent is given immediate notice of the charges and an opportunity for a hearing thirty (30) days after requesting same; and be it further

ORDERED that this is a Final Order and as such is considered a public document pursuant to the Maryland Public Information Article, State Government Article, Annotated Code of Maryland, § §10-611 *et seq.*, specifically, §10-617(h)(2)(vi).

ISRAEL H. WEINER MD, Chairman
Maryland Board of Physician Quality Assurance

YOCON®
YOHIMBINE HCl

Description: Yohimbine is a 3a-15a-20B-17a-hydroxy Yohimbine-16a-carboxylic acid methyl ester. The alkaloid is found in Rubaceae and related trees. Also in Rauwolfia Serpentina (L) Benth. Yohimbine is an indolalkylamine alkaloid with chemical similarity to reserpine. It is a crystalline powder, odorless. Each compressed tablet contains (1/12 gr.) 5.4 mg of Yohimbine Hydrochloride.

Action: Yohimbine blocks presynaptic alpha-2 adrenergic receptors. Its action on peripheral blood vessels resembles that of reserpine, though it is weaker and of short duration. Yohimbine's peripheral autonomic nervous system effect is to increase parasympathetic (cholinergic) and decrease sympathetic (adrenergic) activity. It is to be noted that in male sexual performance, erection is linked to cholinergic activity and to alpha-2 adrenergic blockade which may theoretically result in increased penile inflow, decreased penile outflow or both.

Yohimbine exerts a stimulating action on the mood and may increase anxiety. Such actions have not been adequately studied or related to dosage although they appear to require high doses of the drug. Yohimbine has a mild anti-diuretic action, probably via stimulation of hypothalmic centers and release of posterior pituitary hormone.

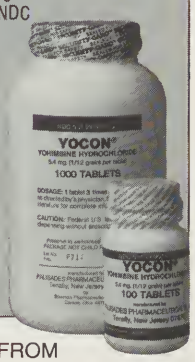
Reportedly, Yohimbine exerts no significant influence on cardiac stimulation and other effects mediated by B-adrenergic receptors, its effect on blood pressure, if any, would be to lower it; however no adequate studies are at hand to quantitate this effect in terms of Yohimbine dosage.

Indications: Yocon® is indicated as a sympathicolytic and mydriatric. It may have activity as an aphrodisiac.

Contraindications: Renal diseases, and patient's sensitive to the drug. In view of the limited and inadequate information at hand, no precise tabulation can be offered of additional contraindications.

Warning: Generally, this drug is not proposed for use in females and certainly must not be used during pregnancy. Neither is this drug proposed for use in pediatric, geriatric or cardio-renal patients with gastric or duodenal ulcer history. Nor should it be used in conjunction with mood-modifying drugs such as antidepressants, or in psychiatric patients in general.

Adverse Reactions: Yohimbine readily penetrates the (CNS) and produces a complex pattern of responses in lower doses than required to produce peripheral a-adrenergic blockade. These include, anti-diuresis, a general picture of central excitation including elevation of blood pressure and heart rate, increased motor activity, irritability and tremor. Sweating, nausea and vomiting are common after parenteral administration of the drug.[1,2] Also dizziness, headache, skin flushing reported when used orally.[1,3]



Dosage and Administration: Experimental dosage reported in treatment of erectile impotence.[1,3,4] 1 tablet (5.4 mg) 3 times a day, to adult males taken orally. Occasional side effects reported with this dosage are nausea, dizziness or nervousness. In the event of side effects dosage to be reduced to ½ tablet 3 times a day, followed by gradual increases to 1 tablet 3 times a day. Reported therapy not more than 10 weeks.[3]

How Supplied: Oral tablets of Yocon® 1/12 gr. 5.4 mg in bottles of 100's NDC 53159-001-01 and 1000's NDC 53159-001-10.

Legal and Ethical Concerns of Your Medical Practice

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation, and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIII, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.

■ ■ ■

Release of Medical Records

Upon receiving a number of calls from physicians and attorneys, I have decided to devote this month's Quality Practice Digest to the issues surrounding the release of medical records to various third parties, including attorneys.

First, it should be noted that pursuant to authority in the Maryland Health Occupations Article, the Board of Physician Quality Assurance can take action against a physician if he fails to release the medical records to another physician. Health Occupation Article, Sec. 14-504 states,

> "... (a) The Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee: ...
> (13) On proper request, fails to provide details of a patient's medical record to another physician or hospital;"

Additionally, the Medical and Chirurgical Faculty's Ethical Opinion 105 addresses the release of medical records to physicians and to attorneys.

.01 Ownership. The physician who creates the patient's medical records is the owner of those records. The medical record includes x-rays and living wills. If the physician is associated with some type of a legal or corporate entity, the records may be the property of that entity, depending upon the terms of the relationship. If a written agreement concerning the custody and ownership of the medical records exists, such an agreement prevails. It is in the physician's best interests to enter into such an agreement.

.02 Transfer between Physicians. The patient's interests are paramount when dealing with a request for transfer of medical records. Physicians who are in possession of a patient's medical records should not refuse, for any reason, to make copies of those records promptly available to the current treating physician upon the receipt of the patient's proper written request. If the patient's medical records include a living will, it should be transferred as well, unless the patient specifically states otherwise. Copies of pertinent medical records or an abstract thereof, should not be withheld pending payment of a patient's outstanding account. If additional information is required, the physician should respond courteously and promptly. A physician who is planning to retire should send medical records to physicians free of charge; medical records of former patients should not be sold. If the copying or abstraction is unduly burdensome or lengthy, a reasonable fee may be charged. Such a fee should be agreed upon at the outset. When transferring x-rays to the current treating physician, the physician in possession of the x-ray may charge the reasonable cost of copying and postage. Under no circumstances may a deposit (refundable or non-refundable) be charged for lending the x-ray to the current treating physician.

.03 Requests by Non-physician Third Parties. When preparing medical records or reports at the request of an attorney or other non-physician third party, a physician may ethically require payment for these records or reports in advance. When simply copying records or reports, a physician should charge only the reasonable cost of copying such data. It is unethical for a physician to withhold preparation of medical records or reports on the basis that the patient's bill for prior services remains outstanding. However, in circumstances where the request does not directly involve the patient's healthcare or reimbursement thereof, a physician may provide only such records or reports as will reasonably impart the information.

.04 Requests Involving Alternative Delivery Systems. When dealing with medical record requests from alternative delivery systems, continuity of patient care must be the physician's primary concern. In every instance, the physician must supply enough information to the alternative delivery system to allow the care of the patient to continue uninterrupted. The treating physician or the medical director within the system has the ultimate responsibility for providing these records. Physicians may charge alternative delivery systems for the transfer of medical records.

The Medicolegal Code of Cooperation further sheds light on the duties of the physician and attorney regarding medical records. It provides in pertinent part:

Medical Records and Reports. Most medicolegal

situations are resolved by an evaluation of medical records and reports. Documents submitted by an attorney in support of a client's claim must contain sufficient information to allow that client's medical condition to be evaluated. Sufficient information may be contained in a physician's medical records or a hospital record. In some cases, however, a special report by the physician may be requested.

Authorizations. An attorney should furnish the physician a proper authorization for release of medical information regarding the patient unless not required to do so by law (HG 4-301). When a treating or consulting physician receives a request for medical information accompanied by a proper authorization, he should promptly furnish that information or the documents requested. If an attorney requests records or reports, he should specify whether a copy of the medical records maintained by the physician in treating the client will suffice or whether a special report is necessary. In the latter case, the attorney's request should specify the information needed in the report.

Fees. A physician may charge a reasonable fee for furnishing medical records or reports. If only existing medical records are requested, the charge should be for reproduction and staff time incurred in that reproduction. If a special report must be prepared, the charge may include compensation for the physician's time expended, as well as staff preparation time and reproduction. It is incumbent upon an attorney to see that the physician is promptly paid any reasonable bill submitted for furnishing medical records or reports.

In summary, the physician, on proper request by another physician, has a duty to release the medical records. They should never be withheld because of a patient's outstanding account. If the physician agrees to prepare medical records or reports for an attorney, the physician may charge a reasonable fee. The physician, however, should not withhold preparation of such reports on the basis of a patient's outstanding bill.

The Maryland General Assembly recently enacted SB 584 (which the governor signed into law). This bill will alter various sections of the Maryland Code pertaining to medical records release. Future issues of the *MMJ* will discuss the implications of this bill.

Speak Out on Consultation

Consultation, a radio program sponsored by the Medical and Chirurgical Faculty of Maryland allows Med Chi physicians to appear each week on the program to discuss the latest developments in medicine and to answer questions about health issues. Med Chi currently airs two sessions of Consultation:

Saturday Evening Consultation
A live program
Saturday from 5:00 to 6:00 p.m. and 6:00 to 7:00 p.m.
Broadcast across the country
An hour-long program
Call-in format: Physician answers questions from listeners

Sunday Morning Consultation
A pre-taped program
Sunday at 7:30 a.m.
Broadcast on WBAL - AM radio
A half-hour program
Interview format: one-on-one talk with John Stupak

Med Chi encourages all physicians to appear on these innovative programs. To register fill in the form below.
Yes, I am interested in speaking on Consultation. Please contact me with scheduling information.

Combination Therapy

Doctor, I have been taking glyburide to control my diabetes for the past two years. I test my glucoses at home, and my blood glucose averages about 160 mg/dl before dinner and at bedtime, but my fasting glucose stays at about 200 mg/dl. I try to stick to my diet. How is it that my blood glucose goes up from bedtime to morning without my eating, and what can I do to improve my glucose control?

The problem you describe is very common in Type II, non-insulin dependent diabetes, and an understanding of why this happens is essential to the successful management of this kind of diabetes.

Your diabetes results from a combination of problems. There is a genetic predisposition to the development of Type II diabetes. Being overweight or overeating makes this kind of diabetes more significant in terms of blood glucose elevation. Patients with Type II diabetes have both a decrease in insulin secretion, and peripheral resistance to the effects of insulin. Insulin acts at the muscle, fat, and liver cells to increase glucose uptake, and at the liver cell to suppress glucose production. In Type II diabetes the insulin that is secreted is unable to maximize glucose uptake or totally suppress liver glucose production. As a result, glucose is cleared more slowly from the blood; in the fasting state, since glucose production is not shut off, blood glucose rises. It is this failure to shut off liver glucose production that results in a rise in blood glucose overnight.

It has also been found that the higher the fasting blood glucose above 160 mg/dl, the lower the insulin level - meaning that fasting blood glucose elevation further inhibits insulin secretion, making the diabetes worse.

The reason that your fasting blood glucose is the highest of the day is that your oral medication is successful in promoting increased insulin release with meals, but is unable to increase insulin levels high enough in the fasting state to suppress liver glucose production.

To lower the fasting blood glucose to normal, several approaches could be taken. If your meal plan is not optimal, this could be improved by decreasing total caloric intake and distributing calories more appropriately, thus allowing the insulin you have to work more efficiently. Regardless of other approaches, diet remains the cornerstone of therapy for Type II diabetes. Increased exercise will also improve insulin responsiveness and should be included in the plan to control your diabetes if there are no other medical reasons why you should not exercise. Your dose of glyburide could be increased if you are not at the maximum dose.

Finally, if none of these therapeutic approaches can be improved, you may require the addition of insulin injections to bring down the fasting glucose. Since it is the fasting glucose you are trying to improve, it makes sense to take an injection of an intermediate acting insulin, either NPH or Lente, at bedtime. This, in combination with daytime glyburide or other oral sulfonylurea may well bring both the fasting and postmeal glucoses under control. This kind of therapy has been called BIDS, for bedtime insulin, daytime sulfonylurea. This approach of giving bedtime insulin in Type II diabetes, with or without daytime sulfonylurea, is relatively new, but has been shown to be effective for many patients.

Evaluation of Patients with Claudication

I read with interest your (Dr. DeLawter's) article on "One Minute with Diabetes" in the June 1990 issue of the *Maryland Medical Journal*. The contribution this month apparently was by Dr. Storella. I would like to call your attention to the last paragraph of her article. She ends her article by stating that "For family physicians and internists the first steps in the evaluation of patients with claudication are doppler testing and diagnostic angiography." I strongly disagree with this. The first steps in evaluation of patients with claudication are not any different for family physicians, internists, or vascular surgeons. Certainly the first steps do not include *diagnostic angiography*. Some of your readers may misunderstand the intent of this sentence. Diagnostic angiography in anyone, especially diabetics, may be associated with significant risk. She goes on to say that percutaneous treatment of short stenosis will help prevent development of foot ulcers. Perhaps in some instances of severe ischemia (often not associated with short stenosis alone) this holds true; however, in diabetics who often have bounding foot pulses, meticulous attention to foot care is more important.

Although vascular surgeons do not always have to be involved in the care of someone with peripheral vascular disease, physicians independent of their specialty need to be made aware that the first step in the evaluation of patients with claudication is a very good history and physical examination. The vast majority of time, this will not only give one an idea of the location and/or extent of their vascular disease, but a good idea of the disability associated with it.

If you have any questions or concerns, I would be most happy to discuss them with you.

STEVEN J. BRAND MD
Frederick

Response from the Editor of One Minute with Diabetes

The commentary letter from Steven J. Brand MD about the "One Minute with Diabetes" article on the subject of peripheral vascular disease and percutaneous catheterization submitted by Janet Storella MD, Radiologist, Suburban Hospital, Bethesda, MD is appreciated.

Certainly Dr. Brand's recommendation that a "very good history and physical examination" should be the first step in the evaluation of any patient is valid, and both Dr. Storella and the editor of the column erred in not mentioning that procedure.

However, the intent of the article was to demonstrate to the internist and family physician that a relatively new procedure, namely transluminal angioplasty and atherectomy, should be considered as a means of shortening hospital stay and possibly preserving some diabetic limbs. Certainly a vascular surgery consultation should be obtained before any angioplasty or atherectomy procedure is undertaken. The relative risk is the same as in nondiabetic patients, assuming normal renal function. The use of angioplasty is also helpful to the plastic surgeon in planning skin graft procedures to assure a viable graft and success of the procedure.

In summary, the goal of this message is that the primary care physician should be aware of the diagnostic and interventional techniques now available to the patient with peripheral vascular disease, and by proper application, promote foot ulcer healing and prevent limb loss.

DeWITT E. DeLAWTER MD, Editor
One Minute with Diabetes

Note: Janet Storella MD was not available for comment at this time. Joseph Mock MD, Chief of Radiology, Suburban Hospital, Bethesda, provided the information for the letter of response. ■

Willie T. Hamlin MD was recently awarded a Distinguished Community Service Award by the Office of the County Executive, Montgomery County for his efforts in establishing a scholarship fund to reward academic achievement in young men at an intermediate school. He was also presented with a Business Appreciation Certificate by the Montgomery County Government for his creation of a publishing company, Three Cs Publications, geared to early childhood development materials; the letters in the name represent character, compassion and cognition. Dr. Hamlin, a psychiatrist from Silver Spring, is the Director of the Institute for Child and Family Psychiatry, Inc.

■ ■ ■

George S. Malouf, Sr. MD, a specialist in ophthalmology, has been named Chairman of Med Chi's Delegation to the American Medical Association House of Delegates, the policy-making body of the AMA. Dr. Malouf is a charter member of the Maryland Society of Eye Physicians and Surgeons, serving as its first Vice President and becoming President in 1981. He has been President of the Prince George's County Medical Society, Chairman of the Council and President of the Medical and Chirurgical Faculty of Maryland, and member of the Board of the Maryland Medical Political Action Committee. In addition, Dr. Malouf has been the recipient of the prestigious A.H. Robins Award and was awarded Prince Georgian of the Year in 1988.

Henry P. Laughlin MD, Associate Editor of the *MMJ* and President-elect of the Frederick County Medical Society, was elected the Surgeon General of the National Society of the Sons of the American Revolution at the historic 100th Annual Congress in Louisville, KY. Laughlin thus becomes only the third Maryland physician (Robert F. Dyer, Jr. MD of Bethesda and J. King B.E. Seegar, Jr. MD of Baltimore served earlier) and the first US psychiatrist to be so honored. The

NSSAR is a leading national organization comprised of more than 26,000 American patriots whose ancestors participated in our War of Independence in the late 1700s.

He has been a member of the NSSAR's Medical Advisory Committee since its inception, and is currently the Chairman. He also served as the Chairman of the National Round Table Committee and holds membership in the National Medals and Awards, Merchandise and US Stamps, and earlier of the Historic Building and Sites Committees. He has been a Maryland Delegate to four National Congresses and five Atlantic Middle States Conferences, and has been a regular participant in the Biennial Trustees Meetings in Louisville, KY.

Long active in the Sons of the American Revolution (SAR), as in Med Chi, Laughlin is a Past President and former alternate National Trustee and National Trustee for the Maryland Society, and is former Vice President General of the national organization. In 1988 he was named Honorary Life President of the Sgt. Lawrence Everhart Chapter of Frederick County, and is now the second-term National Trustee for the United Kingdom. He is a multi-decorated veteran of World War II.

Admiral Laughlin holds a number of SAR awards including the War Service, Patriot, Bronze Good Citizenship, three Meritorious Service, Law Enforcement, and three Silver Good Citizenship Medals - in addition to five Certificates of Appreciation and five Distinguished Service Certificates. In 1988 and again in 1989, he represented the SAR as the Grand Marshal of the National Independence Day Parade in Washington, DC. He is now part of the Parade Organization, having been named the Grand Marshal Emeritus.

Laughlin is the third-term SAR Liaison Officer to another major national patriotic organization, the Sons of the Revolution, and is also currently serving as President of the prestigious National Congress of Patriotic Organizations. He is an Emeritus Professor at the University of Louisville Medical School and is a Past President of both the American College of Psychiatrists and the American College of Psychoanalysts. In June he was named Associate Editor of Med Chi's significant new publication, *Physician's Practice Digest* (PPD). ■

Information for Authors

Manuscripts may be sent to Editor, **MMJ**, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.

Include full name of author(s) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the **Uniform Requirements for Manuscripts Submitted to Biomedical Journals** compiled by the International Committee on Medical Journal Editors (available through the **Annals of Internal Medicine**).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in **MMJ** is protected by copyright and may not be reproduced without the written permission of both author and **MMJ**.

POS Physicians Office System

"With POS, you get the strength and stability of SMS, the leading provider of healthcare information systems, combined with the personalized service that you would expect only from a small company."

In today's demanding and ever changing healthcare environment, you need an information system that will help you meet business challenges and competition head-on.

SMS' Physicians Office System (POS) can give you that edge. POS is a comprehensive medical information system offering all the features required by large clinics, but designed specifically for solo and group medical practices.

- **Advanced Features.** POS capabilities go far beyond billing office functions - they also include extensive management and clinical tools, HMO support, automated appointment scheduling and physicians access to patient information residing in your hospital's system.

- **Backed By The Industry Leader.** POS system software is developed and offered by SMS, the leading provider of healthcare information systems in the U.S. and Europe. With over 20 years of experience and 10,000 physicians as clients nationwide, SMS will be around to support you not only today, but in many years to come.

- **State-Of-The-Art Hardware.** POS runs on state-of-the-art IBM hardware that is easily expandable and adaptable to future requirements. With IBM, you can be sure that your medical information system uses the best and most valued hardware in the marketplace.

But most importantly - POS is delivered with a personal touch. SMS representatives are involved with our clients from the moment they choose our system. We provide continuity by guiding them through both their training and system installation. And we are always available to answer questions and to help them accommodate new regulatory requirements.

Call us today - and learn more about the POS personal touch.

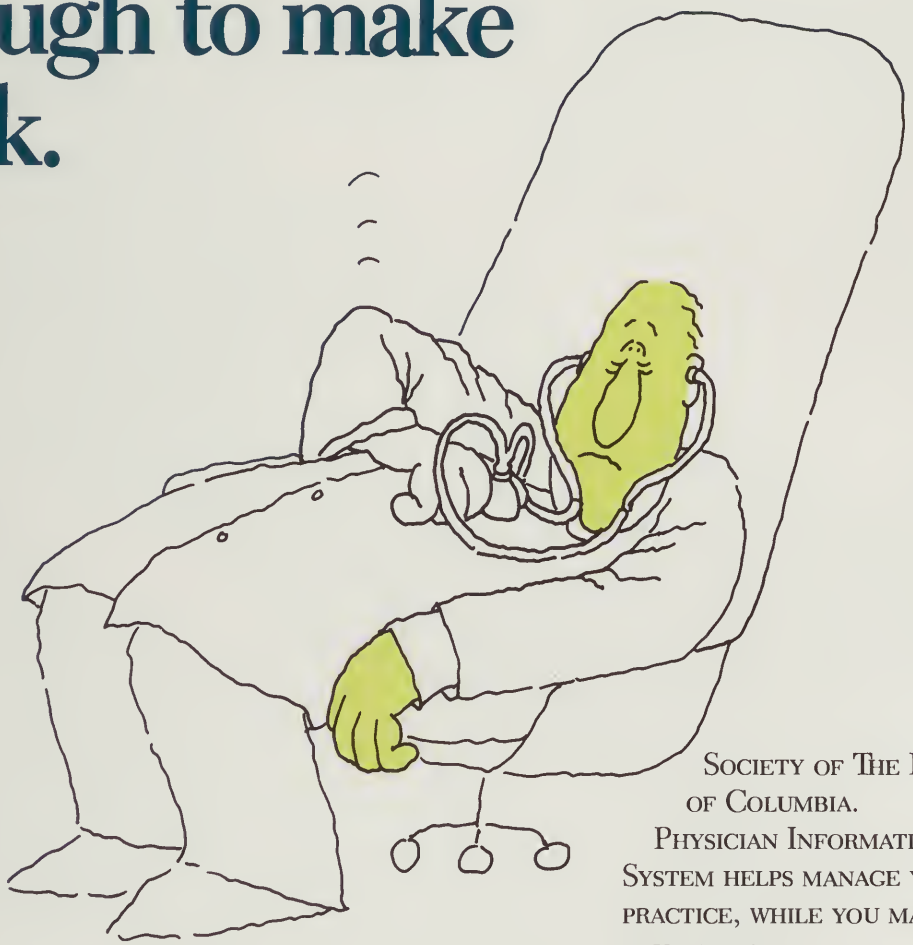
Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.



Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

Healthcare
MERIDIAN

Competition, HMOs, Insurance and slow-paying patients... it's enough to make you sick.

The problems of managing a practice today can really make you sick.

Even worse, they can make the business end of your practice sick, too. That's where we can help.

We're CBSI, the leader in medical office automation systems since 1977. Our Physician Information System submits your insurance forms electronically, posts payments and adjustments automatically, and rushes you complete, up-to-the-minute patient clinical and financial data. Currently relied upon by more than 5,000 physicians in over 50 medical specialties around the area. More than 99% of these systems are still in use today because they're flexible, adaptable and CBSI backs them with unparalleled hardware maintenance, customer support and training.

Since 1981, CBSI continues to be the only provider of medical office automation endorsed by The Medical Society of The District of Columbia.

Physician Information System helps manage your practice, while you manage your patients.

Our Members Are Not Dying For A Free Tail.

Strangely enough, some companies are trying to sell Maryland physicians a professional liability policy that requires them to die or become permanently disabled in order to get a free tail. At Medical Mutual, our members can get a free tail while they are very much alive.

We make the tail available at no extra cost for those of you who are planning to retire from the practice of medicine after five consecutive years on our claims made and/or occurrence policy. If retirement is not in your plans, our tail is free at any age after 15 consecutive years on our claims made policy. As an added feature, you may step down from a higher rated specialty to a lower rated one with no tail charge for making the change.

Your broker or our Member Services Representatives can answer your questions about tail provisions for Medical Mutual members.

Of course, we also give a free tail in the event of your permanent disability or death.

We just don't think this should be your only choice.

The logo for the Physician Rehabilitation Committee was designed in 1988 by Michelle Dunn, then Art Director for Med Chi's Graphics Department. The logo is an abstract image representing a sun rising behind a mountain with a helping hand underneath. The sunrise represents the beginning of a new day--or a new life. The mountain represents the arduous journey involved, and the helping hand represents the Committee and the Physician Rehabilitation Program assisting in that journey to recovery.

Cover design by Valentia McVey.

MALPRACTICE INSURANCE

It pays to review the alternatives

Do you know the answers to these questions?	Yes	No
*Do all carriers have the same success rate defending claims?	☐	☑
*Do all carriers have the same philosophy towards settling unjustified claims for their nuisance value?	☐	☑
*Are any carriers required to renew policies regardless of claims history?	☐	☑
*Do all carriers offer only claims made coverage?	☐	☑
*At retirement, do all carriers provide the same level of protection for the physician's lifetime?	☐	☑
*Do all carriers provide their physicians with the same quality of service?	☐	☑
*Are the premiums of all carriers pretty much the same?	☐	☑

No two carriers are alike. There are excellent alternatives available to all Maryland physicians. It is not too soon to begin a review of your malpractice policy. Contemporary Insurance Services is an independent agency that can advise you concerning all malpractice carriers. We serve hundreds of Maryland physicians and are committed to providing the best coverage at the best price. Don't buy blind. It pays to review the alternatives.

Immunization Update

Routine Age for Haemophilus influenzae Vaccine Is Now 15 Months

Recommendation for Even Younger Age Is Expected Soon

Haemophilus influenzae type b (Hib) Conjugate Vaccine continues to undergo changes in the age at which it is recommended for routine use. The Immunization Practices Advisory Committee (ACIP) on April 13, 1990, recommended the routine vaccination of children at 15 months of age using any of the Hib conjugate vaccines licensed for use. Although there are differences in immunogenicity among the Hib conjugate vaccines made by different manufacturers, all are licensed for use at 15 months. Table 1 shows the differences in immunogenicity of the various conjugate vaccines.

The Immunization Division, Maryland Department of Health & Mental Hygiene (DHMH), has notified all local health departments of this recommendation, and is revising immunization schedules to reflect the routine use of Hib conjugate vaccine.

On the thrid and fourth pages of this update is a copy of the current Important Information about Hib Disease and Hib Conjugate Vaccine statement, for your use.

Note: As of September 4, 1990, the various Hib conjugate vaccine manufacturers had requested FDA approval for administering the Hib conjugate vaccine to children younger than 15 months of age. Obviously, further changes for routine administration Hib conjugate vaccine (possibly younger

age and more than one dose) are forthcoming.

Measles Outbreak Declines over Summer

Second Dose for Sixth Graders (Middle School Enterers) Encouraged

Through August of 1990, DHMH has officially reported 211 cases of measles (rubeola), the highest case count in more than a decade. With the resumption of school, there remains considerable potential for continued outbreaks of measles.

The number one priority continues to be routine administration of MMR to all children at 15 months of age. Health care providers should do all within reason to ensure that children are immunized at 15 months of age with MMR.

Health care providers should be alert to identify possible measles cases and to initiate rapid control measures including immunization of possible contacts. Prompt notification of the (suspect) case to the local/state health department is critical.

The DHMH continues to carefully study the issue of routine second dose measles (MMR) vaccine. At the present time, the DHMH recommends a routine second dose of measles (MMR) vaccine at sixth grade (middle school entry), and for students entering colleges and technical schools. Students who have received two doses of MMR at any time after their first birthday do **not** need a third dose later. Additional information will be provided, via local health departments, regarding the supplemental Federal funding that is now available for the second dose of MMR.

Pertussis Regulation Reminder: Give Information to Parent and Report Reactions

Health care providers who administer pertussis vaccine are required by Maryland Regulation (COMAR 10.52.05) to provide certain information to the patient/parent before pertussis containing vaccine is administered. The Maryland Pertussis Pamphlet meets this requirement. The Immunization Division, DHMH (301) 225-6679, or your local health department, can provide a copy to private physicians or clinics for reproduction.

Also, the regulation requires the health care provider to report any "major" adverse event associated with the administration of pertussis vaccine. This can be accomplished by telephoning your local health department or by mailing a standard morbidity report card to your local health department.

Hepatitis B Perinatal Prevention Funding Received

Report Pregnant Women who have HBsAg to Local Health Departments

The Immunization Division, DHMH, has received supplemental Federal funding for prevention of perinatal hepatitis B. This is the first Federal funding that has been made available to states for hepatitis B prevention.

This program will make hepatitis B vaccine and hepatitis B immune globulin (HBIG) available to infants born to hepatitis B surface antigen (HBsAg) carrier mothers if they have no other means of paying. It also provides for hepatitis B vaccine for the carrier mothers' household and sexual contacts, if they have no other means to secure vaccine. Additional information will be forthcoming via local health departments.

If you identify pregnant women who are HBsAg positive, please report them to your local health department. Specific information can then be obtained that will allow determination of which persons will be eligible to receive the vaccine and HBIG through this funding.

IMPORTANT INFORMATION ABOUT *HAEMOPHILUS INFLUENZAE* TYPE b DISEASE AND HAEMOPHILUS b CONJUGATE VACCINE

Please read this carefully

WHAT IS HAEMOPHILUS INFLUENZAE TYPE b DISEASE?

Haemophilus influenzae type b (Haemophilus b) is a bacterium which can cause serious disease, especially in children under 5 years of age. This bacterium does not cause the "flu" (influenza). In the United States, Haemophilus b causes about 12,000 cases of meningitis (infection of the covering of the brain) each year, mostly in children under 5 years of age. About 1 child in every 20 with meningitis caused by Haemophilus b dies of it and about 1 out of 4 has permanent brain damage. Haemophilus b can also cause pneumonia and infections of other body systems such as blood, joints, bone, soft tissue, throat, and the covering of the heart.

About 1 in every 200 children in the United States will have a moderate to severe disease caused by Haemophilus b before their fifth birthday. Serious Haemophilus b disease is most common in children between 6 months and 1 year of age, but 35 to 40 percent of severe disease occurs in children 18 months of age or older.

HAEMOPHILUS b CONJUGATE VACCINE:

There are at least three types of licensed Haemophilus b conjugate vaccines available for use. All of the vaccines contain the outer coating of the Haemophilus b bacterium which is the part that gives protection against the disease. There are some differences among the vaccines. However, all of the vaccines are considered to be effective.

The Haemophilus b conjugate vaccine is given by injection. More than 90 percent of 18-to 24-month-old children given this vaccine responded by making substances in their blood (antibodies) that are considered to provide protection for at least 1 year against the severe diseases caused by Haemophilus b bacteria. However, several days are required for any protection to be obtained after immunization. Whether the vaccine provides protection against ear infections caused by Haemophilus b bacteria is not known. It does not protect against disease caused by other types of Haemophilus. The vaccine does not protect against meningitis caused by other bacteria. The vaccine is not known to cause Haemophilus disease.

The Haemophilus b conjugate vaccine first became available in 1988 and its use is preferred over an earlier type of vaccine called the Haemophilus b polysaccharide vaccine, which first became available in 1985.

WHO SHOULD RECEIVE THE HAEMOPHILUS b CONJUGATE VACCINE?

1. A single dose of the vaccine is recommended for all children at 15 months of age. Children 15 months to 23 months of age should also receive a dose if they have not already been immunized.

(PLEASE READ OTHER SIDE)

2. Children 24 to 60 months of age may be considered for immunization, especially if they are believed to be at high risk for getting Haemophilus b disease. This includes children attending day-care facilities and children with certain medical conditions such as sickle cell disease, those whose spleens have been surgically removed, and children with cancers associated with decreased ability to fight infections.
3. Children under 15 months of age should not be immunized, because the vaccine is not approved for use in children younger than 15 months of age.
4. Children 60 months of age and older and adults normally would not be immunized.
5. A second dose (booster dose) of vaccine is not recommended at this time.

POSSIBLE SIDE EFFECTS FROM THE VACCINE:

The Haemophilus b conjugate vaccine has few side effects. Information about the vaccines now available in the United States indicates that approximately 1 out of every 8 children who receive the vaccine will get some redness, swelling, or tenderness in the area where the shot was given. About 1 out of every 140 children will have a fever of 102.2°F. or higher. These reactions begin within 24 hours after the shot is given, but generally go away by 48 hours after immunization. Other possible reactions such as vomiting, diarrhea, or crying may occur in approximately 1 out of every 100 children. With any vaccine or drug, there is a rare possibility that allergic or other reactions, such as febrile seizures or even death, could occur.

WARNING—SOME PERSONS SHOULD NOT TAKE THIS VACCINE WITHOUT CHECKING WITH A DOCTOR:

- Anyone who is sick right now with something more serious than a cold.
- Anyone who has had a serious reaction to a product containing thimerosal, a mercurial antiseptic (included in one of the vaccines that is in use).
- Anyone who has had an allergic reaction to a vaccine containing diphtheria toxoid so serious that it required medical treatment.

QUESTIONS:

If you have any questions about Haemophilus b disease or Haemophilus b conjugate vaccine, please ask now or call your doctor or health department before you sign this form.

REACTIONS:

If the person who received the conjugate vaccine has a convulsion or other serious reaction, the person should be seen promptly by a doctor.

If the person who received the conjugate vaccine gets sick and visits a doctor, hospital, or clinic during the 4 weeks after immunization, please report it to:

PLEASE KEEP THIS PART OF THE INFORMATION SHEET FOR YOUR RECORDS

I have read or have had explained to me the information on this form about Haemophilus b conjugate vaccine. I have had a chance to ask questions which were answered to my satisfaction. I believe I understand the benefits and risks of the haemophilus b conjugate vaccine and request that it be given to me or to the person named below for whom I an authorized to make this request.

One Minute with Diabetes

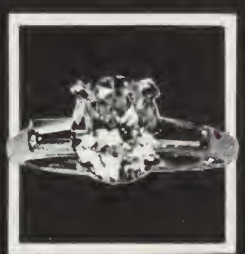
Splitting the Daily Dose of Insulin

Doctor, I have the type of diabetes in which my blood glucose is normal when I go to bed at night, and yet in the morning I wake up with hyperglycemia (250-300 mg/dl). My last glycohemoglobin test was 9 percent (normal 3-6 percent). My meal plan is fine although I am about 10 pounds overweight. I have taken 60 units of NPH insulin before breakfast each day for years. About six months ago, I changed from NPH Pork-Beef insulin to NPH Humulin. After that, the morning blood glucose seemed to be even higher. Should I change to a different kind of insulin? How can I correct the problem of morning hyperglycemia.

There are two approaches to improving the morning hyperglycemia in the presence of normoglycemia at bedtime - either changing to long-acting insulin (Protamine Zinc or Ultralente) or using split doses of NPH insulin. As a general rule, when the morning dose of intermediate-acting insulin (NPH or Lente) rises above 30-40 units, better control can be obtained by splitting the total daily dose into approximately two-thirds to three-quarters before breakfast, and one-fourth to one-third before the evening meal. In this patient, we should begin by changing to 45 units NPH before breakfast and 15 units NPH before the evening meal. Self-monitoring of blood glucose should be done before each meal and at bedtime. If possible, several days of testing should be recorded to obtain a pattern of results before making a change in insulin dosage. A guideline for adjustments of insulin using a mixture of NPH and Regular would be:

Time	Blood Glucose	Insulin
a.m.	high	increase afternoon NPH
noon	high	add regular to a.m. NPH
p.m.	high	increase a.m. NPH
bedtime	high	add regular to p.m. NPH

For low blood glucose results at times noted above, the insulin adjustment should be in the opposite direction. When Humulin NPH insulin is used, Humulin Regular should also be used in the mixture. Since the Humulin or synthetic types of insulin contain less impurities or contaminants than the animal source insulins, they have a shorter duration of action. It was a correct observation to note that the Humulin NPH insulin produced an increase in the morning hyperglycemia.



Another approach to this problem would be to change to one of the long-acting insulins (Protamine Zinc or Ultralente), and attempt to keep a once daily injection program. This type of program is usually not as successful as the split dose system and if attempted, the meal plan should be adjusted to contain an adequate bedtime snack; 2:00 a.m. blood glucose testing should be continued at lease four times a day until the readings are below 130 mg/dl almost 100 percent of the time, and there are almost no episodes of hypoglycemia. The glycohemoglobin test should be repeated about every eight weeks and should be within normal limits if well controlled.

A word of caution - it should be remembered that diabetic patients with autonomic neuropathy will often have hypoglycemic coma in the absence of the warning symptoms of nervousness, hunger, tachycardia, and sweatiness. These patients cannot be regulated as closely as others and it would be safer to accept blood glucose readings as high as 150 mg/dl to avoid hypoglycemic coma even on occasion.

Executive Director's Newsletter

November 1990

Federally Proposed Laboratory Regulations

Med Chi thanks all its members who wrote to the Health Care Financing Administration (HCFA) to request an extension of the comment period for the Clinical Laboratory Improvement Act (CLIA-88) regulations. Med Chi is especially grateful to Senator Barbara Mikulski for responding to Med Chi's request for assistance. Although the comment period ended on September 21, 1990, HCFA has been inundated with more than 25,000 letters and telegrams opposing these regulations.

Under this proposal, the federal government would oversee 300,000 laboratories-- a third of them located in doctor's offices. Labs performing simple and low risk testing would be subject to strict personnel requirements. Nurses, who now perform many lab tests, would no longer be able to do so under the new requirements.

If enacted, it is unclear how these regulations would impact Maryland's laboratory regulations. Because of the outpouring of complaints, however, Congress now must resolve the issues of cost, availability of labs in rural areas, timeliness of lab results and patient care management. Med Chi will keep you informed of further actions on this issue.

Medicare Reimbursement Changes

Effective April 1, 1990, physicians are required to accept Medicare assignment on claims for services provided to individuals who are also eligible for Medical Assistance.

On September 1, 1990, all physicians are required to submit claims for Medicare patients whether or not the physician accepts assignment. Physicians may not charge the beneficiary for preparing the claim and claims must be filed within one year from the service date or payment will be reduced by 10 percent. **Following this newsletter is a flier for your office informing your patients of this important change in Medicare. This flier can be mailed to your Medicare patients or posted in your waiting room.**

On September 4, 1990 the "model fee schedule" for physician services was printed in the *Federal Register*. The fee schedule is based on the resource-based relative value scale (RBRVS) and will replace the current reasonable charge payment mechanism.

By November 15, 1990, some physicians may be receiving a Comparative Performance Report (CPR). As part of the Omnibus Budget Reconciliation Act (OBRA) of 1989, Medicare carriers were required to monitor and profile physicians' billing patterns. Under the CPR program, the billing patterns of physicians will be compared to the billing norms for all physicians in the same specialty and locality. Only physicians who exceed the billing norms will be sent a CPR which will describe the procedures or services billed for at a higher rate than their peers. An explanatory letter will accompany the report and contain information on who to contact to discuss the report.

While CPR is being utilized strictly as an educational and informational tool and a response is not required, physicians are encouraged to contact the carrier to correct any misinformation.

A discussion of the new balance billing limits appears in Med Chi's Fall issue of the *Physician's Practice Digest*. The article includes formulas that will be applied for non-participating physician's services. The MAAC (maximum allowable actual coverage) will be replaced by new limiting charges starting January 1, 1991. The AMA will continue to fight these balance billing limits in the legislature by seeking to delay implementation of the new limits.

Release of Medical Records to Non-Custodial Parent

Med Chi has received numerous inquiries regarding the release of a child's medical records to a non-custodial parent. Although this is not mentioned in the medical records statute (HG Article, Section 4-301 et seq), Family Law Article, Section 9-104 provides:

Unless otherwise ordered by a court, access to medical, dental and educational records concerning the child may not be denied to a parent because the parent does not have physical custody of the child. (1987, ch. 337).

For additional questions about the release of medical records contact Med Chi at 301-539-0872 or 1-800-492-1056.

Training Update for Physician Office Laboratory Supervisors

The Eastern Area Resource Office of the National Laboratory Training Network and the Maryland State Department of Health and Mental Hygiene will present "Training Update for Consulting Supervisors to Maryland's Physician Office Laboratories" on Tuesday, November 13, 1990 at the Laboratory Workshop, Laboratories Administration in the O'Conor Building, 201 West Preston Street in Baltimore. This half-day lecture series and panel discussion is designed to review and update the responsibilities, methods and objectives of consulting supervisors who provide service to both physician office laboratories and the public. For additional information about this program contact Eunice Rosner at 215-363-8500 or Jack De Boy at 301-225-6080.

Physician's Practice Digest

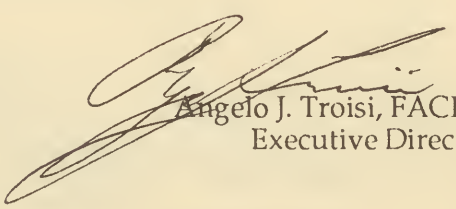
This fall, Med Chi is introducing the premiere issue of the *Physician's Practice Digest* (*PPD*). This new publication, which will be sent to all Med Chi physicians, is designed to address the business concern of the practicing physician. The first issue includes information on medical waste management, Medicare legislation and effective marketing of a practice. Med Chi is interested in your reaction to this new publication and would appreciate your comments. If you have any suggestions, opinions or an interest in contributing articles to the *PPD*, please send correspondence to Editor, Physician's Practice Digest, 1211 Cathedral Street, Baltimore, MD 21201.

Med Chi Handbook and Bylaws

Copies of the Med Chi *Handbook* for 1990-1991 and the May 1990 edition of Med Chi's *Bylaws* are now available at no charge to all members. The *Handbook* provides a listing of all Faculty officers, committee members, component medical societies and specialty societies. Committee member listings in this year's *Handbook* include a complete address and medical specialty codes. The *Bylaws* are a guide to the Faculty administration and governing rules. For a free copy of either of these publications, contact Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056.

Med Chi Compendium

Med Chi's *Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland* (1990 edition) is now available for all Med Chi members. An outstanding reference, the *Compendium* summarizes Maryland's health laws and regulations, outlines a collection of Med Chi and AMA ethical standards, lists current Med Chi policies, and provides guidelines for physicians and codes of cooperation for medical professionals. For a free copy of the *Compendium*, contact Bernadette LaRue at 301-539-0872 or 1-800-492-1056.



Doctor/Lawyer Partnership Against Drugs

On October 12, 1990 Med Chi physician representatives for the Doctor/Lawyer/Teacher Partnership Against Drugs met with their lawyer counterparts to discuss ways to bring doctor/lawyer education teams into schools to discourage 7th graders from using drugs. Additional physician volunteers are needed to participate in this program. For more information about how to become involved in this effort, contact your local component society or call Betsy Newman in the Public Relations Department at 301-539-0872 or toll free 1-800-492-1056.

Semiannual Meeting Awards

During the Semiannual meeting in September, Gerald A. Glowacki, M.D. was presented with the 1989 *Maryland Medical Journal* Best Article Award for his article, "Estrogen Replacement Therapy: Risk/Benefit Ratio for Treatment," which was featured in the July 1989 *Maryland Medical Journal.*

The winners of the Fifth Annual Med Chi Media Awards for Excellence in Medical Journalism were also announced at the meeting. The most outstanding entry in the daily newspaper category was "Mercy on Wheels" by Patrick Gilbert for *The Evening Sun.* In the magazine category, Larry Thompson of *Warfield's* won for The Ultimate Body Shop." The *Columbia Flier's* Lynne Salisbury was recognized for "One Day at a Time" in the non-daily newspaper category. "Just for the Health of It," by John Stupak for the Consultation Radio Network won in the Radio and Television Category.

Angelo J. Troisi, FACHE
Executive Director

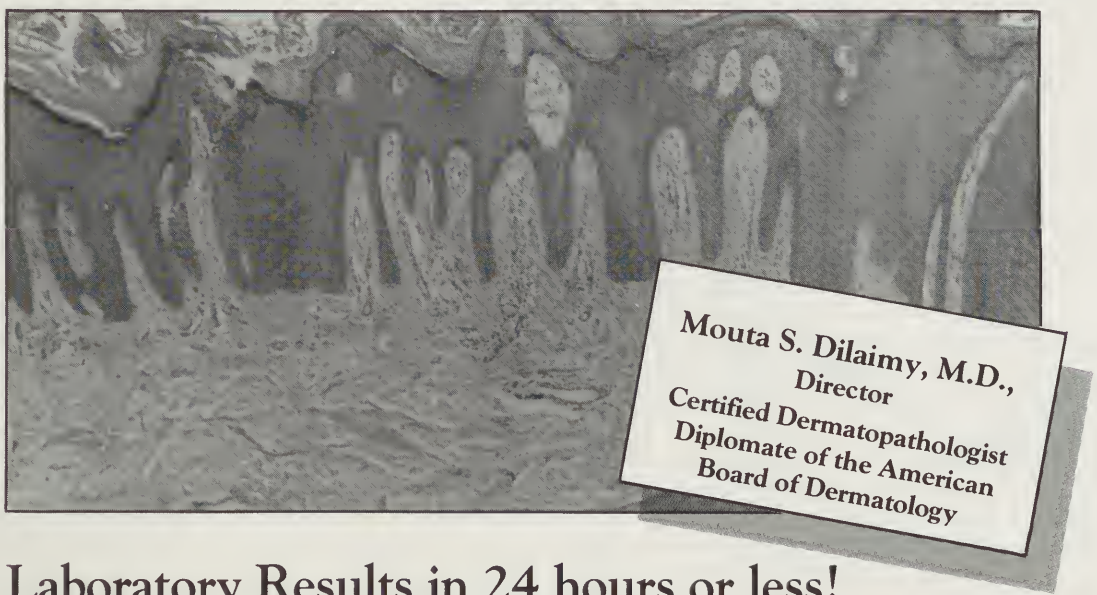
To My Medicare Patients

Dear Patient,

Starting September 1, 1990, the Federal Government requires *all* physicians to submit your Medicare claim for you.

From now on, I will submit a claim to Medicare for you and the Medicare payment will be sent to you.

Please do not submit a claim to Medicare on your own.



Thank you.

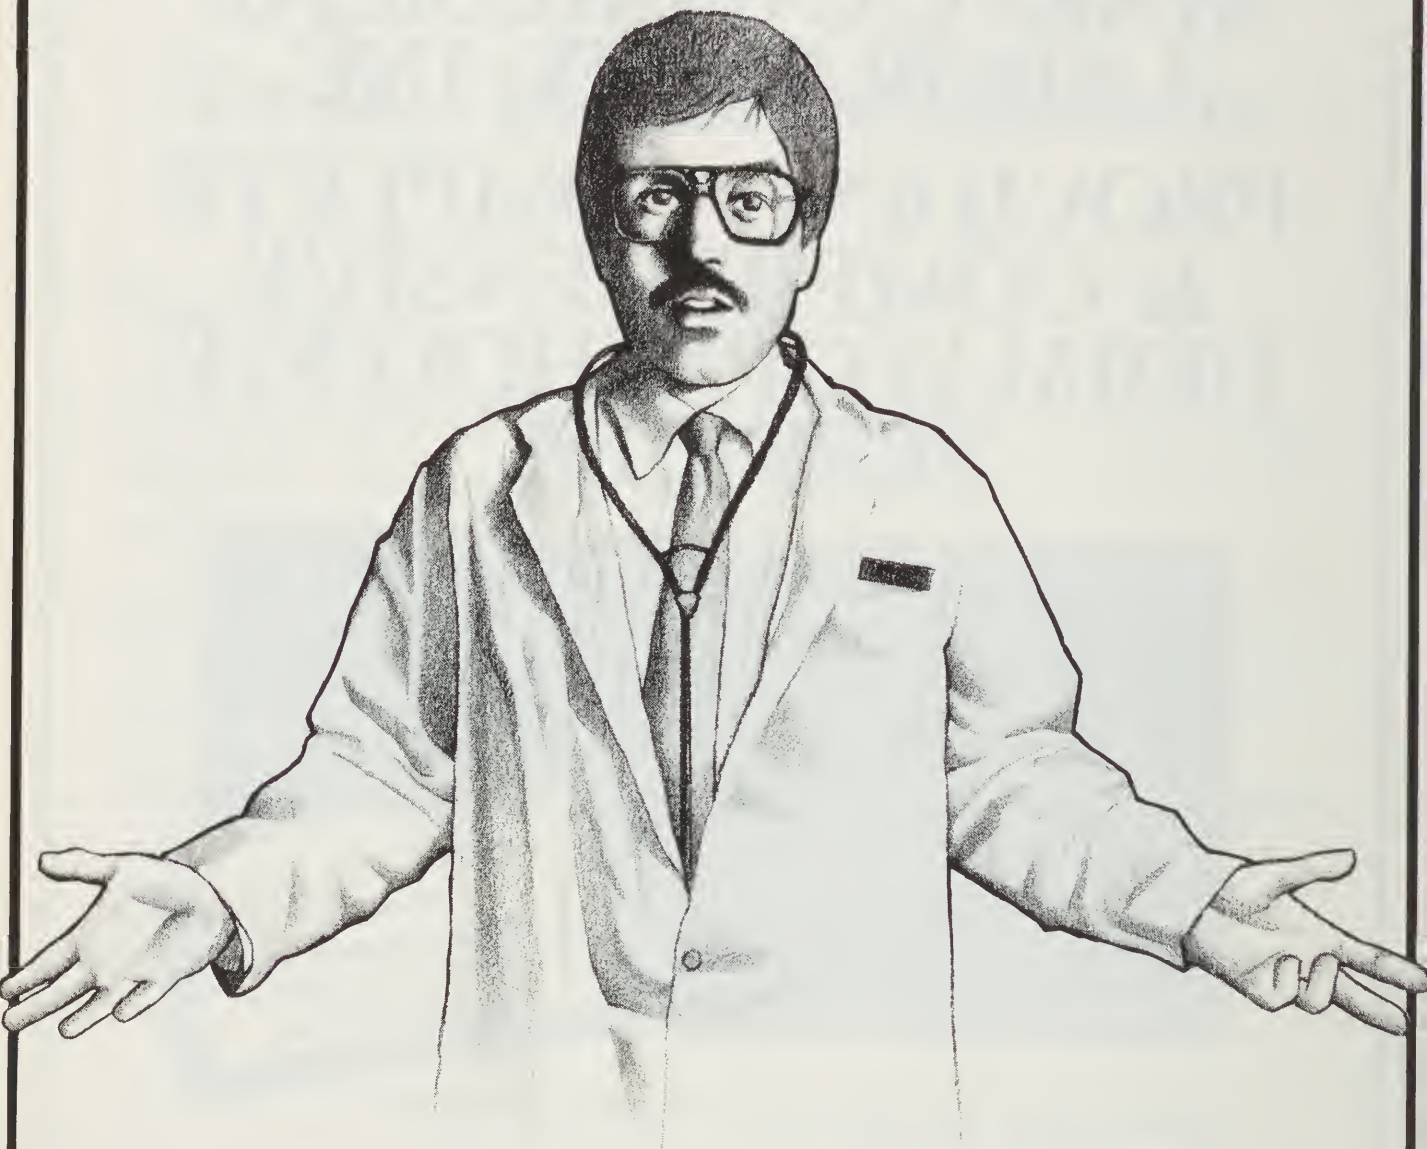
_____

Effective April 1, 1990, physicians are required to accept Medicare assignment on claims for services provided to individuals who are also eligible for Medical Assistance. On September 1, 1990, all physicians are required to submit claims for Medicare patients whether or not the physician accepts assignment. Physicians may not charge the beneficiary for preparing the claim and claims must be filed within one year from the service date.

MARYLAND MEDICAL LABORATORY, INC.

PROVIDING COMPLETE & COMPREHENSIVE DERMATOPATHOLOGY SERVICES

Laboratory Results in 24 hours or less!
(After Specimen Arrival)



Dermatopathology Services is a division of Maryland Medical Laboratory, Inc. one of America's largest medical laboratories. Dermatopathology Services is directed by board certified dermatopathologists and provides complete, comprehensive, histopathology services.

- Biopsy Procedures
- Immunofluorescence Procedures
- Monoclonal Antibodies
- Immunopathology (Direct and Indirect Immunofluorescence)
- Consultation with a Dermatopathologist
- Special Stains
- Slide Preparation
- Pick Up Service
- Teleprinting (To Qualified Clients)
- Complimentary Collection/Transport Supplied
- Insurance Assignments
- Complete, Clinical Diagnostic Testing Services

The Physician Rehabilitation Program of the Medical and Chirurgical Faculty of Maryland: Twelve Years and Going Strong

Stanley R. Platman MD and Michael C. Llufrio CAC

The Medical and Chirurgical Faculty of Maryland established the Physician Rehabilitation Committee in 1978. This Committee is responsible for the Physician Rehabilitation Program which for the past twelve years has served the Maryland medical community on matters of physician impairment, including alcoholism, drug abuse, psychiatric illness, marital/family problems, organic impairments and physical handicaps. Maryland was one of the first states in the nation to offer such a service to its physicians.

The Program serves a dual purpose: (1) It assists in ensuring that Maryland consumers receive competent medical care and (2) it directs impaired physicians to the proper help and monitors their recovery. By monitoring the recovery of the physician participants, the Program is able to advocate for them on matters such as licensure, malpractice insurance, and hospital privileges.

Also under the purview of the Committee is the education of Maryland physicians on issues of physician impairment, as well as on substance abuse in general. An example of the latter is the highly successful conference, "Practical Clinical Management: Drug Abuse Education for the Primary Care Physician," which was held October 20-21, 1990. This conference, presented by the Committee on Drugs, was sponsored by the Physician Rehabilitation Program. Working in concert with the Committee on Drugs and the Committee on Alcoholism and Chemical Dependency, the Program has numerous plans for ongoing educational endeavors. One of these is the recently published newspaper, *Straight Forward,* which will be distributed on a monthly basis.

This issue of the *Maryland Medical Journal* is another means that the Physician Rehabilitation Program is using to educate Maryland physicians. Dr. Gallegos et al discuss the terrible toll that substance abuse by physicians can have on the family. Dr. Platman defines the role of the Medical Review Officer in identifying illicit drug use among employees. The reasons behind physician addiction to prescription drugs and how substance abuse by physicians might be prevented are addressed by Curtis Wright IV, MD, MPH. Finally, Stanley Platman MD and Michael Llufrio describe the evolution of the Physician Rehabilitation Program, and the roles and responsibilities of Med Chi's Committee on Physician Rehabilitation. The Committee would like to express its appreciation to Dr. Curtis Wright who has been instrumental in the planning and coordination of this dedicated issue.

The Program is continuing to grow. It will be working with the Focused Professional Education Program to help physicians receive individualized educational evaluations and retraining - again, working to provide patients with competent medical care. The Program's staff will be expanded in order that assistance can be rendered to more physicians then ever. After all, "Helping is our Business."

The Effect of Physician Impairment on the Family

Karl V. Gallegos MD; Kathy Bettinardi-Angres MS, RN; and G. Douglas Talbott MD

Dr. Gallegos is Director of Research, Caduceus Foundation, College Park, GA; Ms. Bettinardi-Angres is Director of Family Services and Research, Parkside Recovery Center of Woodsridge, IL; and Dr. Talbott is Founder and Director of the Impaired Physicians Program, Talbott-Marsh Recovery Center, College Park, GA.

There are few studies on the effect of physician impairment on the marriage and the family. There is a need for research on both the functional and non-functional medical marriage, and treatment needs to be devised to focus on the special needs of the medical family.

Over the last three decades several hundred articles have been written about the impaired physician.[1] During the same period, many authors have written about the medical marriage, yet little attention has been paid to the effect of chemical dependence on the physician's family.

Much of the existing literature on the medical marriage suggests that physicians' long work hours are the source of conflict in the marriage. However, studies of physicians do not show a correlation between long work hours and unhappy marriages or divorces.[2,3] Vaillant found that 47 percent of the physicians he studied reported an unhappy marriage compared to 32 percent of controls.[3] Gabbard and Menninger contend that "blaming lack of time is a rationalization for troubles from other sources of conflict in the medical marriage." Physicians' long working hours may be more of an effect than a cause of marital problems.[4]

Only a few studies of physician impairment also address marriage and family-related issues. Winick reported that marital problems are a significant causative factor for physicians' drug abuse. He found that 71 percent of the spouses of drug-abusing physicians, and 60 percent of their office nurses were aware of the physician's drug use, but in none of the cases were measures taken to intercede.[5] Canavan has stated that the spouse and children of the impaired physician are usually the first to suffer from the side effects of chemical dependence, and they are the first to identify the impairment.[6] Modlin and Montes reported that the "disillusionment of expectations to gain succor in marriage, and the inability to grow in the traditional role of the father, and to achieve satisfaction as a parent from the parent/child relationship were antecedents to physician drug use."[7] Hall et al have stated that marital problems among addicted physicians result from both partners' unfulfilled dependency needs. The authors concluded that the major issue was the professionals' resentment of being treated differently by their spouses than they are treated by their patients and colleagues.[8]

Vaillant et al noted that physicians, especially those in primary care specialties, were more likely than non-physicians to be heavy users of drugs and alcohol, and to have relatively unsuccessful marriages. In their investigation, the presence of these "occupational hazards" appeared to be strongly associated with individual life adjustments occurring before medical school. Those physicians who had the least stable childhoods seemed to be especially vulnerable to these hazards.[3]

What comes first, the dysfunction in the marriage or the dysfunction in the chemically-dependent physician? What is the impact of the dysfunction on the family? What can be done to treat the problem? The purpose of this report is to: describe the progression of the family impairment as a function of the disease progression in the impaired physician; examine data from two treatment centers specializing in family issues related to physician chemical dependence; and draw conclusions to ultimately minimize our suffering and that of our colleagues and families.

Background

Lewis has described the healthy family as one that preserves the sanity and encourages the growth of both parents, and produces healthy children.[9] Healthy marriages are characterized by deep levels of intimacy. Waring defines intimacy as a "multifaceted dimension of an interpersonal relationship at a point in time, which is a composite of: conflict resolution, affection, cohesion, sexuality, identity, compatibility, autonomy, and expressiveness."[10]

Vincent has stated "many good doctors, when confronted simultaneously with both family and professional problems prefer the medical pressures."[11] He also has compared and contrasted the requirements of being a good physician versus being a good spouse and parent:

- "The good physician can control feelings. A good spouse and parent is able to express feelings.
- A good physician works hard. A good spouse and parent is available for companionship.
- A good physician is characterized by the following factors: success, status, prestige, professional esteem, and money. To fulfill each of these needs requires time away from the spouse and parent relationship.
- Patients want a physician who is available, helpful, and good humored."[11]

Thus, it quickly becomes apparent that the two systems compete selectively for essentially all of the physician's resources.

The Medical Marriage

Even when there is no chemical dependence in the family, the medical marriage is believed to be a family at high risk for impairment. Gabbard and Menninger have described physicians as individuals who are "conscientious about attending to the needs of both their practices and their families. They make futile efforts to please everyone that leave them with the feeling that they have pleased no one. They have an exaggerated sense of responsibility that makes them feel guilty about things beyond their control. Their unrelenting perfectionism and chronic self-doubt produce a profound sense that what they are doing is never enough."[12]

The physician marriage appears unique.[13] There is an overwhelming work priority in the physician's marriage and the non-physician spouse is recruited into activities to compensate for the absent physician-parent. There is difficulty communicating. The physician who is treated with special status while at work, is not so privileged or entitled at home. Frequently, physicians have an exaggerated overexposure to sex (through the examination of patients) which may also have a negative impact on physicians' marital relationships.

Finally, there are cultural expectations of the doctor's family.[14] Spouses and children of physicians feel they are expected to behave in ways different from the general population.

Chemical Dependence and the Medical Marriage

Generally, the family is affected by chemical dependence to the same extent that the dependent person has progressed in his/her illness. Initially, the chemically-dependent physician spends even less time at home and, therefore, neglects duties as a spouse and/or parent. As the disease progresses, more of the family's resources are spent on the addict's alcohol and drugs, and drug-using behavior. Eventually, the chemically-dependent physician will tend to rationalize, justify, and project blame onto others (particularly those around him or her). The family will begin to join in the addict's denial, and consequently begin to feel hurt, anger, disgust, frustration, and guilt about feelings they have toward the addicted physician. Progressively, family members are likely to shield the addict and themselves from exposure and embarrassment. When family members protect the addict from the consequences of his or her disease, they enable the addict to stay sick.

Frequently, family members are afraid to intervene on behalf of the patient because they fear the anger of the addict, who may become physically and verbally intimidating or abusive. The family of the impaired physician frequently worries about others in the community finding out, about the shame, and about the loss of financial well-being and status. At this point, if the family does not overcome these fears and intervene on behalf of the impaired physician, the addict gains a destructive power over the family, and the family becomes hostage.

Codependence

In recent years, attention has been directed to the

understanding and treatment of the family members of chemically-dependent individuals. There appears to be a reflexive adaptive behavior by the family as it attempts to live with the chemically-dependent person. This maladaptive behavior is referred to as codependence and may take an extraordinary emotional toll.

Codependence is "a pattern of painful dependence on compulsive behaviors and on approval from others in the search for safety, self-worth and identity. Recovery from this condition is possible."[15] Among the characteristics ascribed to adults raised by a chemically-dependent parent are: fear of losing control; fear of feelings; fear of conflict; an overdeveloped sense of responsibility; feelings of guilt when standing up for oneself; an inability to relax, let go, or have fun; harsh self-criticism; living life from the stance of a victim; the tendency to be more comfortable with chaos than security; the pressure to assume an all or nothing point of view; suffering a backlog of grief; and a tendency to react rather than to act, and an ability to survive.[16-18]

Treatment of the Family

Two major issues arise when dealing with the families of recovering alcoholics and addicts: (1) Is there another chemically-dependent family member who also needs help? and (2) What impact has the patient's disease had on the family? Both issues need to be explored in detail during the assessment and treatment process. When the family is involved in the recovery process, family members have an opportunity to see that they are not alone or so unusual. Family therapy combats the sense of isolation and allows family members to acknowledge the feelings of anger, shame, guilt, disappointment, or fear common among families of chemically-dependent individuals. Patients will frequently use any excuse for not completing treatment or avoiding key therapeutic issues. Often the family can be helpful in getting the patient to be more cooperative, more honest, and more open. Family involvement facilitates the decompression of painful issues and allows improved communication to occur. It is not unusual for many couples to continue family therapy in the aftercare period.[19]

Family therapy has been shown to be an effective tool in treating the impaired physician.[20,21] The tasks of the family members are to: confront and deal with the emotional pain from the past, as well as the anxiety and apprehension over the future; reestablish communication; gain the ability to give one another support; and reduce the fear that intimate communication will lead to rejection or a competitive disadvantage.

Self-help groups are also available for family members. Al-Anon[22] is for family members of alcoholics, and Nar-Anon is for the family members of addicts. Family-related issues are most frequently cited as excuses for relapses in treatment outcome studies. Most therapists feel that treating the family unit as a system provides the most beneficial outcome.

Analysis of Impaired Physician Marriage and Family Data

Currently, an ongoing collaborative research effort on the impaired physician is underway at the Talbott-Marsh Recovery Center (TMRC), in Atlanta, Georgia and the Impaired Physicians Program, Parkside Recovery Center of Woodridge, Illinois.

Together these two centers have evaluated and treated more than 2,500 physicians and almost 4,000 health professionals. This database is a rich source of information relative to physician impairment and recovery.

Since 1974, more than 2,200 physicians have been referred to the Georgia Impaired Physicians Program (now located at the Talbott-Marsh Recovery Center) for an assessment of impairment. Ninety-eight percent were U.S. citizens. Approximately 3 percent had neither chemical dependence nor a psychiatric problem. A primary psychiatric disorder was exhibited by 7 percent. The remaining 90 percent were chemically dependent. The study population is comprised of only the chemically-dependent physicians.

The mean age of the study population was forty-four years, with the mean reported age of first alcohol or drug use being seventeen years. Most (95 percent) were male, and 96 percent were white. Sixty percent had had at least one previous chemical-dependence and/or psychiatric treatment. In addition, approximately 50 percent had a legal and/or licensing problem related to their substance abuse.

Most of the chemically-dependent physicians were married (65 percent), but only 28 percent were in their first marriage. Fourteen percent were divorced, 6 percent were separated, and 10 percent had never been married. Of those physicians who were married, divorced or separated, 82 percent reported significant marital discord as a result of their substance abuse. Factors of conflict presented by the study population included those referred to by Angres (Table) as well as issues specific to the substance abuse behavior but directed at the family, such as dishonesty, concealment of drugs, infidelity, and violence.

Although 70 percent cited alcohol as a drug of abuse, only 25 percent abused alcohol exclusively. More than 73 percent of the physician-patients reported they abused two or more drugs. A narcotic was the drug of choice for 48 percent. Approximately 40 percent of the study population reported administering their drug of choice intravenously or intramuscularly. Most of the physicians who used drugs reported obtaining their drugs from the workplace.

A sampling of 139 physicians discharged from the program in 1988 was undertaken to learn more about addiction in first and second degree relatives. Eighty-six percent reported a family history of addiction with 55 percent reporting chemical dependence in at least one parent. When both parents were reported to have been chemically dependent, the physician-patient was more likely to have begun substance abuse at an early

age and to have presented for treatment at a younger age. When one or more older siblings were reported to be chemically dependent, the physician-patient was more likely to be a poly-drug addict, with first drug use at a relatively early age, and first treatment at an early age.

Recovery and the Medical Marriage

Angres[23] compared the responses of recovering physicians and their spouses to those of a sample of "normal" physicians questioned by Gabbard and Menninger[3] (Table). The purpose of this study was to determine if there was a difference between the couples from the recovering group (N=50) versus the normal group (N=111). All recovering physicians and their spouses had been exposed to family therapy compared to less than half of the normal couples.

Each respondent was asked to rate the sources of conflict in the marriage on a scale from zero to five, according to their importance in his or her marriage. A zero indicated the issue was "not applicable" as a source of conflict within the respondent's marriage, and a five indicated it was "of paramount importance."

Gabbard and Menninger found that both physicians and spouses from normal groups ranked the sources of conflict fairly similarly. For example, "lack of time for fun, family and self" ranked first on both lists. However, there were two major discrepancies. First, physicians reported seeing the "amount of time away from home at work" as a much more important source of conflict than spouses did. Second, spouses considered "lack of intimacy" a much more serious problem than the physicians did. The four areas of greatest disagreement in order from most to least disparate were: (1) "amount of time away from home at work"; (2) "lack of intimacy"; (3) "lack of shared responsibilities for children and for work around the house"; and (4) "money management."

The recovering couples ranked sources of conflict fairly similarly also. For example, "lack of intimacy" was ranked first, followed by "tension in the family home" and "frequency in sexual relations." The four areas of greatest disagreement in order from most to least disparate were: (1) "lack of time for fun, family and self"; (2) "quality of sexual relations"; (3) "finances"; and tied for fourth were "money management" and "lack of shared responsibilities for children and for work around the house."

In the normal group, the complaint of lack of time due to the demands of practice may be a function of externalizing the conflicts of the marriage to factors outside of the marriage. The recovering group saw lack of intimacy as the major source of conflict in the marriage. Angres has concluded that the recovering physician's marriage and the normal physician's marriage are probably the same in terms of amount of conflict. Both marriages are impaired by the practice of medicine and the inherent problems associated with being a physician. However, recovering physicians and their spouses, perhaps because of their exposure to family therapy while in treatment for their addiction, appear to have more insight into their problems and the solution to these problems.

Conclusion

Unique stressors, predisposing psychological vulnerabilities, genetic loading, and a culture permissive of substance abuse are predisposing factors to an impaired medical marriage. Even when the risk factors are minimized, the medical family may be programmed for malfunction. Physicians are chosen selectively and trained to enter a profession which is rigorous and objective. On the other hand, we enter into marriage and parenthood without any formal training, peer review, or codes of acceptable practice in areas of intimacy, sharing, and loving.

Chemical dependence increases the risk for catastrophic conflicts and reduces satisfaction and gratification in medical marriages. Treatment and recovery appear to make couples more aware of relationship needs and more capable of solving problems within the marriage.

There needs to be more research on both the functional and the nonfunctional medical marriage. Physicians need to be trained early in their career about the occupational risk factors and their contribution to an impaired family system. Treatment needs to be devised to specifically focus on the special needs of the medical family. Physicians who are recovering from chemical dependence and their family members need family therapy.

Table. Ranking of Sources of Conflict Cited by Physicians and Their Spouses

	"Normal" Physicians (N=111)[1]	Recovering Physicians (N=50)[2]	Spouses of "Normal" Physicians (N=111)[1]	Spouses or Signif. Others of Recovering Physicians (N=50)[2]
Lack of time for fun, family and self	1	9	1	3
Amount of time away from home at work	2	6	8	6
Frequency of sexual relations	3	4	4	4

POS Physicians Office System

"With POS, you get the strength and stability of SMS, the leading provider of healthcare information systems, combined with the personalized service that you would expect only from a small company."

In today's demanding and ever changing healthcare environment, you need an information system that will help you meet business challenges and competition head-on.

SMS' Physicians Office System (POS) can give you that edge. POS is a comprehensive medical information system offering all the features required by large clinics, but designed specifically for solo and group medical practices.

- **Advanced Features.** POS capabilities go far beyond billing office functions - they also include extensive management and clinical tools, HMO support, automated appointment scheduling and physicians access to patient information residing in your hospital's system.

- **Backed By The Industry Leader.** POS system software is developed and offered by SMS, the leading provider of healthcare information systems in the U.S. and Europe. With over 20 years of experience and 10,000 physicians as clients nationwide, SMS will be around to support you not only today, but in many years to come.

- **State-Of-The-Art Hardware.** POS runs on state-of-the-art IBM hardware that is easily expandable and adaptable to future requirements. With IBM, you can be sure that your medical information system uses the best and most valued hardware in the marketplace.

But most importantly - POS is delivered with a personal touch. SMS representatives are involved with our clients from the moment they choose our system. We provide continuity by guiding them through both their training and system installation. And we are always available to answer questions and to help them accommodate new regulatory requirements.

Call us today - and learn more about the POS personal touch.

The Role of the Medical Review Officer in the Workplace

Stanley R. Platman MD

Dr. Platman is Chief of Psychiatry and Vice-president for Medical Affairs at Homewood Hospital Center, Inc. He is also Chairperson of Med Chi's Physician Rehabilitation Committee.

Drug testing is now a firmly entrenched part of the American workplace. It is the role of the Medical Review Officer to decide whether a test is positive and meaningful in terms of illicit drug use.

People don't check their substance abuse problems at the door when they enter the workplace. In a recent study of seven transportation companies, the rate of drug-positive urine specimens varied from 3 percent to 16 percent.[1] These rates included pre-employment, random, and probable-cause drug testing. Employees caught up in substance abuse tend to be absent from their jobs up to sixteen times more often, claim three times as many sick benefits, and file five times as many workers' compensation claims as other employees.[2] The National Institute on Drug Abuse (NIDA) estimates that one in five workers aged 18-25, and one in eight workers aged 26-34 use drugs on the job. Not all people with a substance abuse problem fit the traditional stereotype. For example, a serious cocaine user is typically:

- well-educated (14 years of education),
- employed (77 percent),
- well-paid (37 percent earn over $25,000 annually), and
- engaged in illegal activities to support the drug habit (56 percent).

Eight million American workers were tested for drugs in 1989. Nearly double that number, fifteen million, are expected to be tested in 1990. As recently as five years ago, drug testing in the workplace seemed likely to be just another idea that would come and go in the war on drugs. Today, it is a firmly entrenched part of the American workplace and growing by the minute. A survey by the American Management Association found that 50 percent of U.S. companies test either job applicants or current employees for drugs, a jump from 21 percent four years ago. A majority of Americans, increasingly alarmed by illicit drug use, favor drug testing in the workplace.[3] In a Gallup poll conducted in December 1989, over 60 percent of respondents favored such testing. It is evident that even employees are beginning to recognize the problems generated by substance abuse in the workplace. David Fontaine, Executive Director of the Baltimore Area Labor-Management Committee, noted in the Committee's *Annual Report*

1989-90 that "the workforce is shrinking and getting older, and the new entrants will include more women, minorities, and immigrants. New workers will need more qualifications to get the new jobs and will have to be retrained three to five times in their worklife. We will have to build systems that provide child and family care, *design strategies that realistically attack drug and alcohol abuse and rising healthcare costs.....*" (emphasis added).

Hospitals frequently have impaired employees, and this all too often includes physicians. The Johns Hopkins Hospital will be the first in the nation to require its medical staff to undergo random alcohol and drug screening. The new policy affects all physicians with staff privileges - about 1500 full- and part-time physicians. There are physicians at Hopkins that see the policy as intrusive. Many are concerned that the error rate will be high and that there will be difficulties in distinguishing recreational use from impairment. In addition, it is unlikely that routine testing will assay the drugs most likely to be used by physicians. The American Civil Liberties Union (ACLU) called the Hopkins plan "unfortunate." However, individuals often show evidence of substance abuse in their urine long before they are noted to be impaired by their peers and, therefore, identification can assist in early treatment and the monitoring of potentially dangerous physicians.[4] The planned implementation of this policy at Hopkins has been delayed, and opposition by the academic and medical staff has been growing.[5]

The Law

On September 15, 1986, President Reagan issued Executive Order 12564 mandating a drug-free federal workplace with the intent that the federal workforce would serve as a model for all American businesses. The Executive Order states that all employees testing positive for drug use should be referred to appropriate treatment or counseling, and requires all federal employees to refrain from using illegal drugs on or off the job. The Order limits testing to those drugs listed in Schedules I and II of the Controlled Substances Act and, in practice, has limited federally mandated testing to marijuana, cocaine, opiates, amphetamines and phencyclidine (PCP). On July 11, 1987, Congress passed legislation affecting implementation of the Executive Order under Section 503 of the Supplemental Appropriations Act of 1987, Public Law 100-71, in an attempt to establish uniformity among federal agency drug- testing plans with regard to reliable and accurate drug testing, employee access to records, and confidentiality of drug test results. In addition, the legislation established a means for centralized oversight of the federal government's drug-testing program.

The rationale for urine drug screening derives, in part, from the experience of the military. In 1980, 27 percent of military personnel reported using an illicit drug within the month preceding the survey; in 1985, only 9 percent reported similar use. During the years between these two surveys, a program of urinalysis was instituted. In recent interviews, 64 percent of military personnel reported believing that urinalysis had reduced drug use in the military.[6] In the most recent survey, released in July 1988, illicit drug use in the previous month was reported by only 5.3 percent, representing a decline in drug use of more than 80 percent over the eight year period.

However, it is important to note that much controversy exists around drug testing in the workplace. As recently as May 16, 1990, U.S. District Judge Gerhard A. Gesell ordered the Justice Department to hire a lawyer even though the lawyer had, as a matter of principle, refused to take the drug tests required of all applicants for attorney jobs in the Department. Judge Gesell ruled that such testing is unconstitutional if the job has nothing to do with police work, public safety, or official secrets.[7] On the same day, Maryland legislators urged the state's personnel secretary to meet with state employees over the proposed drug- testing program, even though the testing was only to be for those employees in "sensitive" jobs. On June 6, 1990, a federal judge in Manhattan declared unconstitutional a New York City Transit Authority policy, issued in the mid-1980s, that mandated marijuana testing for all applicants and employees, even those holding jobs unrelated to safety. The decision affected more than 2,000 people who tested positive for marijuana use from 1984 to 1987.[8]

The Council on Scientific Affairs of the American Medical Association (AMA) addressed a number of employee drug-testing issues in 1987.[9] Constitutional issues of search and seizure, invasion of privacy, and due process were major concerns but the Council's report noted that the law is complicated and the ethical issues are being affected by social change. It would appear that at this time, the AMA advises employee testing only if the outcome is related to motivating employees to seek appropriate assistance and treatment. The AMA has opposed mandatory screening for drugs except in specific cases such as pre-employment testing of people whose jobs affect the health and safety of others, the monitoring of compliance as part of a treatment program, and in situations where there is clear evidence of a problem.

The Role of the Medical Review Officer

Drug testing can be used in a variety of ways. The most common is the testing of job applicants. Response to a positive result in these cases is almost universal; the applicant is simply not hired. Testing of current employees is more complicated. At some companies, a positive test is grounds for immediate discharge. More commonly, employees testing positive are funneled into mandatory drug treatment programs and then carefully monitored. The physician, in his or her role as a Medical Review Officer (MRO), is the essential decision maker, as it is the MRO who decides whether a test is positive and meaningful in terms of

illicit use. It is wise for the MRO and the employer to develop jointly the significant worksite policies to be used in addressing these issues. The models utilized by most MROs are based on the federal experience and the NIDA guidelines.[10] However, nonfederal employers may expand the number or type of drugs to be tested.

The Medical Review Officer role is not new and was, in fact, developed over twenty years ago by Richard Reigard MD who served as the Federal Department of Transportation's MRO and as the Federal Air Surgeon. The role has broadened as drug testing in the workplace has become more common, and since *Mandatory Guidelines for Federal Workplace Drug-Testing Programs* was published in the Federal Register on April 11, 1988.

The *Guidelines* provide for the use of a Medical Review Officer. The MRO plays a critical role in assuring that the requirements of the *Guidelines* are met. The MRO must be a licensed physician with knowledge of substance abuse disorders. He or she works with management and may refer those with problems for counseling and treatment. The MRO acts as a vital screen to assure that management is not notified of a positive result on a drug test until the MRO is satisfied that it resulted from illegal drug use. The MRO's review may include a medical interview, a review of the individual's medical history, or a review of other relevant biomedical factors.

As required by the *Mandatory Guidelines*, the MRO's specific responsibilities are:

1. Receive confirmed positive results from the laboratory.
2. Request, if needed, a quantitative description of test results.
3. Receive a certified copy of the original chain of custody.
4. Review and interpret positive test results.
5. Inform the tested individual and provide test results.
6. Conduct, if necessary, a medical interview with the tested individual.
7. Review the individual's medical history, or any other relevant biomedical factors.
8. Give the individual an opportunity to discuss test results, but not necessarily face-to-face.
9. Order a reanalysis of the original sample in a NIDA certified laboratory, if necessary.
10. Consult with others if a question of accuracy arises.
11. Consult with laboratory officials.
12. Do not accept urinalysis results that do not comply with the *Mandatory Guidelines*.
13. Do not declare as positive an opiate-positive urine without clinical evidence. (Ingestion of a variable quantity of poppy seeds, which contain small amounts of morphine, can produce a positive result. The presence of needle tracks would obviously provide clinical evidence.)
14. Determine whether a result is scientifically insufficient.
15. Determine whether a result is consistent with legal drug use. (For example, a cocaine-positive urine may follow proper medical use. Cocaine is still employed as a local vasoconstrictive anesthetic in bronchoscopy or dentistry, and not infrequently, amphetamines may be used for treatment of resistant depression or narcolepsy.)
16. Forward results of verified positive tests to management officials empowered to recommend or take administrative action.

The role of the MRO can be expanded if contracted between the MRO and the specific business entity. It is important to note that the MRO does not adjudicate, punish, or otherwise arrange consequences for employees whose drug-positive urines apparently do not result from medical treatments or from problems in handling or analyzing samples.

In brief, the MRO determines whether a reason other than illegal drug use explains a drug-positive urine. If the MRO verifies illegal drug use, the case is referred to the employer's Employee Assistance Program (EAP) and to the appropriate management official. If illegal drug use is not verified, the test result is deemed negative, the employee is informed, and no further action is taken. It is essential that the employee understands and gives consent to the MRO's role. The employee should be aware that if there is no reasonable medical reason (e.g., legitimate prescription) or other reason (e.g., breakdown in chain of custody or laboratory error) to account for the positive results, the results will be disclosed to management and others as required by the plan or contract. Any medical information that is not specifically related to the use of illegal drugs will be treated as confidential and not disclosed. Problems related to the role of the MRO have received limited attention in the medical literature,[11,12] although a new journal, *MRO Alert*, is to be published in the near future.[13]

Clinical Difficulties in Interpreting Tests

Most "acceptable" drug-positive urines come from patients receiving legitimate medical treatment (e.g., methadone-positive urines from patients receiving methadone maintenance treatment; codeine- and/or morphine-positive urines in patients with codeine prescriptions for cough or pain; THC-containing urines in cancer patients prescribed tetrahydrocannabinol for anti-emetic purposes). Phencyclidine (PCP) is not approved for any medical use and, therefore, is always a drug of abuse. Natural opiate drugs are derived from poppy plants. Poppy seeds commonly used on bagels frequently contain sufficient amounts of morphine to produce detectable concentrations of morphine in urine, even though the amount of ingested morphine is insufficient to cause any behavioral

effect in the individual. Either codeine or morphine may be found in urine for a few days after eating poppy seeds. Therefore, a positive urine resulting from poppy seeds is *not* a false positive, since the drug is actually present in detectable amounts. In contrast, heroin, an acetylated semisynthetic product of morphine, does not occur in poppies. Its metabolic product, 6-monoacetylmorphine, also does not occur after poppy seed consumption, so the presence of that compound in urine proves illegal heroin use. However, absence of the metabolite does not rule out heroin use as it only persists briefly in the body and a heroin user may have an opiate-positive urine which no longer shows the metabolite.

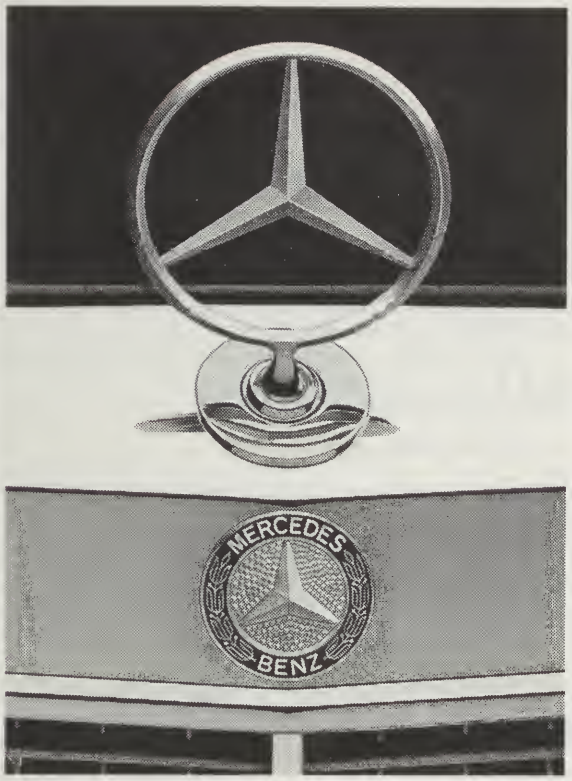
The duration of time that a drug is detectable by urinalysis is complicated by many variables. Such a determination must take into account the pharmacokinetics of the drug, as well as individual variation in the absorption, distribution, metabolism, and excretion of the drug and its metabolites. The medical use of cocaine, morphine, codeine, or amphetamines will lead to detectable amounts in urine for several days. The sensitivity of urine assay methods generally available today allows detection of cocaine or amphetamine use for a period of one to three days and opiate use for two to four days. Benzoylecgonine can be detected in the urine at levels of 300 ng/ml for up to twenty-two days after the last cocaine use.[14]

False negatives can be produced by errors in collection or laboratory analysis. Drug abusers can also generate false negatives by substituting another person's urine for their own. Drug-related deception is not uncommon. Techniques to address these issues include direct observation of urine collection, sampling of the urine temperature, and creatine and osmolarity measurements of the urine.

The Business of Being an MRO

Many MROs have been employees of government agencies or of companies. Today, there is an increasing trend to have MROs be independent from the entity testing its employees and from the laboratory assessing the urine samples. The value of this independence is that the MRO can more narrowly define his or her role and not become an instrument of management or the laboratory. It is also usually advisable to have the MRO independent of the company's EAP or treatment program. The MRO contracts with a specific company to perform those roles generally defined in the federal *Guidelines*, although the role may be expanded in terms of the drugs to be tested and the amount of direct clinical evaluation. Charges are usually based on a cost per urine evaluated regardless of the urine being positive or negative. However, charges may be higher for those urines which are not routinely or randomly provided. At this time, the physicians in an MRO organization are legally protected by their customary malpractice insurance, although some MROs may have specific liability insurance coverage.

The cost of providing MRO services is increasing due to the desire of companies for rapid response, the need for technology to assure that all the complicated steps in determining the presence of a positive test have been completed, and the fact that many companies are national in operation and discussion with an employee may require long and expensive telephone conferences.



Although the clinical information for evaluating the five types of drugs identified by Reagan's Executive Order is available, skill and experience are required, especially for MROs willing to evaluate a wider spectrum of drug abuse. MROs should be thoroughly versed in addictions, toxicology, laboratory methodology, and specific regulations and laws. They should put forth much effort to establish excellent relations with the testing laboratories and collection sites. Adequate communication is essential to avoid false negative and false positive results.

Summary

MROs need to be knowledgeable and experienced in the area of substance abuse. This relatively new field raises many clinical issues, complicated by legal and ethical issues. It is advisable that MROs be independent from the companies, laboratories, and collection sites with which they contract or to which they relate in the process of performing their evaluations.

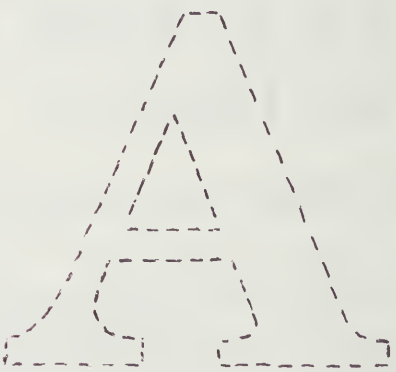
LifePlus Introduces Exotic Flavors

Move over chocolate, vanilla & strawberry. LifePlus has introduced **PINA COLADA** and **ORANGE SHERBET** flavored shakes to its physician-supervised weight control program – a program that combines a modified fast with behavior modification, nutritional counseling and exercise.

"We've eliminated the boredom of the typical modified fast. People crave variety. That's why we were first to introduce creamy chicken soup, and now we have exotic flavors. Just in time for the summer, these new flavors will help patients feel that they're not missing out on summer fun just because they're on a diet," says Cleo Bennett Kelly, president of LifePlus.



The shakes and soups, which are available in two high protein formulations, are low in fats, carbohydrates and cholesterol, yet high in protein and essential amino acids. LifePlus is only available through physicians. For information or samples, call LifePlus.

If these are your Questions:

What is meant by impairment?
When considering self–disclosure, what issues should be taken into account?
How will others react to my self–disclosure?
Should I tell my colleagues?
What should I tell my patients?
What should I say on applications for privileges, licensing, etc.?

The Physician Rehabilitation Committee Has the Answers

For a free copy of "To Disclose or Not to Disclose," a brochure of questions and answers on the topic of self–disclosure for the physician recovering from impairment or illness, published by the Physician Rehabilitation Committee of the Medical and Chirurgical Faculty of Maryland as a service to all Maryland physicians, members and non–members, write to Med Chi, Physician Rehabilitation Committee, 1211 Cathedral Street, Baltimore, MD 21201 or call (301) 539–0872 or in MD 800–492–1056.

Physician Addiction to Pharmaceuticals: Personal History, Practice Setting, Access to Drugs, and Recovery

Curtis Wright IV, MD, MPH

Dr. Wright is on the Drug Abuse Staff of the Pilot Drug Evaluation Staff, Center for Drug Evaluation and Research, Food and Drug Administration, Rockville, MD. Reprints: Curtis Wright IV, MD, MPH; 1520 Gridley Lane; Silver Spring, MD 20902.

Specialists in the field of anesthesiology, emergency medicine, and general or family practice are at increased risk of addiction. They may manifest a pattern of habitual overwork and/or grandiosity, have unrestricted access to drugs, and initiate use through self-medication.

Impaired physicians are to the rest of the profession as canaries were to the coal miners of an earlier generation. Until we can determine the risk of addiction to drugs for a specific individual *before* the individual is exposed to them, we must rely on the experience of the most vulnerable individuals in our occupational cohort to learn how to protect ourselves from addiction to the chemical tools of our trade. This article describes the current state of knowledge regarding physicians at risk for addiction to pharmaceuticals (prescription drugs), some ongoing studies, and some of the measures that have been tried to manage that risk.

Addiction to alcohol and other drugs of abuse has been a major concern of the profession ever since the initial American Medical Association (AMA) initiatives in this area in the 1970s.[1] The impaired professionals programs in Maryland and other states were influenced by a model which included inpatient rehabilitative treatment, participation in Alcoholics or Narcotics Anonymous, contingency contracting, individualized case management, and peer group therapy. Studies of such programs by Talbott, Gualtieri, and others,[2-4] have shown that the incidence and prevalence of alcoholism (DSM-IIIR alcohol dependence) among physicians is nearly that of the general population, and that the prognosis is for complete rehabilitation following adequate treatment for the majority of physicians dependent on alcohol or a combination of alcohol and other drugs. Physicians are neither especially vulnerable to alcoholism nor protected from it, and can be rehabilitated if their illness is recognized and effectively managed. This conclusion is consistent with the general literature on alcoholism, and the clinical experience of most treating physicians.

The literature on drug abuse and dependence among physicians, however, has contradictions not found in the alcoholism literature. Drug addiction has been described as both a serious occupational risk of all physicians, and as a problem which is rare among professionals.[5] Medical students and young physicians have been described as being less likely than their peers to indulge in recreational use of illicit drugs,[6] yet another article has recommended the

withdrawal of meperidine from the market as being too likely to addict nurses and doctors.[7] Most of the divergent opinions have resulted from articles which generalize from data collected on small populations in treatment, about the risk of addiction among all physicians.

Who is at Risk?

One of the oldest screening programs for detecting physician impairment due to addiction was established by the Federation of State Medical Boards of the United States (FSMB).[8] The screening questions used are given in Table 1, and are directed toward the identification of prevalent or evolving cases of impairment.

The questions, with some variations, are part of the data set collected by the FSMB in collaboration with the AMA for the Physician Screening Data Base, a clearinghouse for interstate communication regarding disciplinary information which was mandated by the Federal Health Care Quality Improvement Act of 1986. While both the FSMB and the AMA are limited in their ability to participate in epidemiologic surveys by their duty to protect the confidentiality of information supplied to the Data Base, both do participate in several ongoing projects. One such project, reported on in the *MMJ* in 1987, is the Pilot Impaired Physician Epidemiologic Surveillance System[8] which surveys physicians in treatment in an attempt to add to the available information on physicians at risk for alcohol and drug problems. A second project, currently being funded by the National Institute on Drug Abuse, is looking specifically at drug dependence among physicians on a national scale; results are expected to be available in 1991.

Until such national data are available, the only general source of data is from states having active impaired professionals programs.[2-4] Such programs provide assistance in evaluation, rehabilitative treatment, posttreatment monitoring, and advocacy for the impaired professional. They are the major source of information about drug use by physicians. However, it is risky to draw conclusions based on analysis of such data since such programs identify only physicians whose addiction was detected.

Table 2 gives the risk of addiction by self-declared specialty compared to the general physician population. It includes physicians identified by a Georgia program,[2] a California program,[3] an Oregon program,[4] and in a study of 100 alcoholic and drug-dependent women in medicine.[9] The specialties overrepresented in the identified cases are anesthesiology, family or general practice, emergency medicine, and psychiatry. In spite of the agreement of several programs, the disadvantage of self-declared specialty is that while closely corresponding to actual specialty status for tightly controlled, credentialled, hospital-based specialties like anesthesiology, there is a high rate of misrepresentation of specialty in other settings. In addition, the increased risk seen among physicians in general practice and emergency medicine may reflect preferential choice of this type of practice by professionals *after* their impairment develops rather than an a priori increased risk.

Another source of data on relative risk is in articles prepared by programs treating a substantial number of impaired professionals. Vogtsberger[10] and Brewster[5] have reviewed a number of surveys published by such programs and have discussed the limitations of this data in detail. Many such articles contain case reports of a pattern of behavior which recurs with some frequency, a pattern which Talbott has described as the "M-Deity" syndrome[2] and Jones as "precipitating factors."[11] This pattern consists of a physician who shows considerable promise in medical school, training, and early career, followed by a pattern of compulsive overwork leading to difficulties with family, friends and, eventually, with peers. Words like "acheiver," "successful, " "perfectionist," "driven," "overworked," and, ultimately, phrases like "grandiose about his practice," and "overworked, then resentful of extra duties" are used in describing such physicians. It is not clear from this literature if this is a portrait of a physician at increased risk of addiction, or the portrayal of the gradual loss of social attachment and the obsessional

Table 1. Questionnaire of the Federation of State Medical Boards (FSMB) of the United States

1. Have you ever been treated or hospitalized for mental illness or drug or alcohol abuse?
2. Have you ever been convicted of violation of any national, state, or local statute?
3. Have you ever been denied the privilege of taking an examination given by any state licensing board, or been denied a certificate/license issued to you, or been the subject of any other disciplinary action?
4. Has any state licensing board revoked or suspended a certificate/license issued to you, or taken other disciplinary action?
5. Have you ever had your hospital privileges limited, denied, or revoked?
6. Have you ever been denied a DEA registration number or been issued a restricted DEA registration?
7. Have you ever had any malpractice suits filed against you? How many?
8. Have you ever been denied membership in any medical association or specialty society?
9. Have you ever resigned from a hospital staff after a complaint or a peer review action has been initiated against you?
10. Have you ever voluntarily surrendered a medical license, a controlled substance registration, or a DEA registration?
11. To your knowledge, are you the subject of a current investigation by any licensing board?

Table 2. Relative Risk by Self-Declared Specialty Compared to the General Physician Population

Specialty	Georgia Program[2] n=1000	California Program[3] n=100	Oregon Program[4] n=63	Women (Bissell)[9] n=100
Anesthesiology	3.1	3.5	1.2	0.98
Family/General	2.1	1.6	2.8	1.5
Emergency Medicine	2.0	3.0	1.25	2.33
Psychiatry	0.97	1.11	1.51	2.33

Relative risks >2.0 as compared to the general physician population, are likely to be significant.

protection of employment seen as a result of addiction. In either event, this pattern of hard work and occupational success makes identification and confrontation difficult.

Prescribing Practices

Recent articles on impaired prescribers from states with triplicate prescription laws are providing intriguing data on the impaired professional. One such article by Kofoed et al[12] reviewed 300 complaints of inappropriate prescribing in Oregon for the period 1981-1986. Nearly all such complaints involved controlled substances, and the majority were detected in the course of routine audit by the Board of Pharmacy. Of 130 key complaints against physicians for excessive or inappropriate writing for controlled substances, seventy-five were terminated in the investigative stages, leaving fifty-five to be reviewed by the full Board. Of those fifty-five cases, thirty-four resulted in voluntary surrender by the physician of the right to prescribe controlled substances, sixteen resulted in other sanctions, and five were closed without comment. Most of the cases (53 of 130) involved general or family practitioners, and thirty-five of the fifty-five cases reviewed by the Board involved repeated offenses. Kofoed et al use the term "pseudo-benevolent prescriber" to define the physician at risk for excessive prescribing, the description of which is very similar to Talbott's "M-Deity" concept. This pattern is characterized by:

1. A strong and deeply felt need to help.
2. Professional grandiosity and omnipotent feelings such as "Only I am able to help this patient."
3. An orientation toward immediate solutions such as symptomatic relief that overshadow long-term consequences.
4. A stated inability to handle his or her feelings if treatment that could provide immediate relief is withheld.

Medical Students at Risk

Another discussion of relative risk for professionals comes from studies of substance use and abuse among medical, pharmacy, and nursing students. Since the 1970s,[6] studies have reviewed the patterns of drug and alcohol use among students in the health sciences and all have found substantial use of "soft" drugs (e.g., benzodiazepines, methaqualone, cannabis) among the student population. It is interesting to note that there is a positive association between high academic achievement and alcohol and drug abuse in both medical student and physician-in-training populations which holds up in prospective studies.[13]

As the drug-using high school cohort of the 1970s begins to mature into the college and medical school cohorts of the 1980s and 1990s, papers are appearing that reflect the increasing detection of abuse of illicit drugs (e.g., cocaine and opiates) among physicians. Personal communications with treatment centers have verified that these reports do reflect a new type of physician addict, one who has brought a pre-existing personal history of drug abuse and addiction into the profession.

Behavioral Risk Factors

The literature cited suggests that the physicians at increased risk are those with a prior history of illicit drug use, those in high-risk specialties (e.g., anesthesiology, emergency room medicine, general or family practice), those who have a pattern of over-prescribing, and those who manifest a pattern of academic success or habitual overwork accompanied by a combination of professional grandiosity and excessive guilt.

To Which Drugs are They Vulnerable?

The same sources which discuss physicians at risk also discuss the drugs to which impaired physicians have been addicted. Such lists are subject to bias due to a tendency to overreport drugs which are tightly controlled under the law (Schedules I & II), and to underreport drugs which are subject to lesser scrutiny (Schedules III - V).[14] Drug diversion is greatly affected by changes in availability brought about by federal, state, and local regulatory actions. Table 3 summarizes data from a variety of sources on the relative abuse of drugs by physicians. These data include reports of drug use by medical students, surveys of practicing physicians,[6] and a ten-year survey of anesthesiology training programs,[15] as well as the sources cited previously.

The reports highlighted in Table 3 describe a cannabis-cocaine pattern of abuse in medical students, benzodiazepine abuse in the practicing physician, a mixed opiate-tranquilizer pattern in the Georgia physician treatment program, a mixed oral opiate-tranquilizer pattern amoung over-prescribers, and an almost pure opiate addict profile in the anesthesiologist survey. The most commonly abused drug is proportional to the prevalence of that drug's use in each treatment setting, and it may be that the patterns of abuse among healthcare professionals are related to the patterns of access to and the familiarity with the drugs used. Of particular concern is the fact that most of the drug use among young physicians is for self-treatment. Use of drugs with a high abuse liability in order to function normally is hazardous, since it is a pattern of use which is less likely to fade over time than is simple recreational use.[13]

How Effective is Prevention, Intervention, and Treatment?

Increased attention to the impaired professional over the last few decades has limited physicians' easy

access to controlled substances through the restriction of mail-orders and samples supplied by "detail" men, as well as early detection of diversion and self-prescription. The areas where these controls are not effective include the dispensing practice of the general or family physician, the operating and emergency rooms, and the endoscopy suite. In these situations, drugs are subject to diversion at the point of administration (usually nurses), or while a physician is in sole custody of a supply of a drug (e.g., anesthesiologists). It is worth noting that the most common drug involved in addiction among nurses is meperidine, the most common postoperative parenteral analgesic; among anesthesiologists, it is either meperidine or fentanyl, the most common operative and postoperative analgesics. Methods of diversion of parenterals usually consist of administration of smaller doses to patients than are logged out, fraudulent log entries, or replacement of active drugs in multiple dose vials with saline or water. Methods of diversion (for personal use) of oral dosage forms usually consist of fraudulent dispensing (i.e., dispensing of less pills than were prescribed), diversion of returned medications, or various kinds of fraudulent prescribing (e.g., deceased patient, duplicate prescription, or imaginary patient).

The most extensive literature on drug abuse detection among and intervention with physicians has emerged from studies of anesthesiologists. As a specialty, anesthesiology has been willing to address drug abuse and addiction as an occupational hazard. Drug abuse in anesthesiology training programs afflicts 2 percent of the physicians in training,[15] involves both opioid and non-opioid abuse, and results in a significant fatality rate.[16,17] Systems to control access to narcotics by anesthesiologists have included: satellite pharmacies in the operating room, narcotics boxes locked to the anesthesia machines, periodic screening for adulteration or diversion of multi-dose vials by refractometry, tamper-resistant "case-packs" rather than individaul vials, and periodic audit.[18] Studies of the process of detection, intervention, and treatment have shown that physicians are willing to use their professional hierarchy to confront alcoholism and addiction,[19] and that impaired professionals programs are effective in engaging impaired professionals in a treatment contract that is usually successful,[2-4] although special care is advocated in the case of the opioid-dependent anesthesiologist.[20]

What More Might Be Done?

The data would suggest that the current measures to control exposure to addictive substances offer reasonable protection for all but those who directly handle and administer the drugs, either by injection (nurses, anesthesiologists) or in oral dosage forms (general and family practitioners who dispense). These groups still seem at greater risk compared to the rest of the medical community, and it is not clear that the laws protecting the general public are adequate to reduce this risk.

It is unlikely that the answer to physician abuse of and dependence on prescription drugs lies in more education on alcoholism and illicit drug addiction. Education is effective only to the extent that it is able to shape attitudes, and it is reinforced by the attitudes and behavior of a peer group. Until most physicians consider all drugs that alter mood, behavior, and the perception of pain as potentially addicting, the problem will remain with us. Medical schools, residency programs, hospitals, group practices, HMOs, and professional societies must establish and maintain a zero-tolerance attitude toward self-prescription and self-administration of psychoactive drugs. Physicians must not write prescriptions for themselves, dispense such medications to themselves, or make personal use of samples provided by pharmaceutical companies. Physicians in practice should establish a professional courtesy relationship with other physicians such that it is *never necessary for them to write even the most in-*

Table 3. Specific Drugs or Drug Classes as a Percentage of All Physician Drug Use

Drug Name or Drug Class	Medical Students Recreational[6] (n=381)	Physician Survey Recreational[6] (n=107)	Physicians Survey Self-RX[6] (n=135)	Pilferage Episodes[14] (n=352)	Excessive RX[12] (n=130)	Georgia Impaired Physicians[2] (n=1000)	Women Physicians[9] (n=100)	Anesthesiology Survey[15] (n=334)

nocuous prescription for themselves. Insofar as it is possible for the medical community to do so, it should impress upon its members that it is both unethical and dangerous for a physician to self-administer any controlled substance.

It is possible to establish and support a system of professional values which makes it risky and wrong to divert medications for personal use without a prescription, and thus to reduce the chances of impulsive or imprudent use. Little has been written in the professional literature regarding methods of protecting the dispensing practice, although the use of prescription-sized tamper-resistant packaging, improved record-keeping, and local or regional agreements on dispensing practices have all been tried.

The basic principle is that drugs with abuse potential represent a threat of addiction to all individuals exposed to them. If addiction is to be prevented, it must be made both difficult and improper for physicians to treat themselves with psychoactive drugs. While not every physician is called upon to practice the relapse-prevention disciplines necessary for the recovering addict, the same principles should apply to all physicians. If our professional culture can be altered so that fewer of us self-medicate with addicting drugs, the need may be reduced for early identification, treatment, and rehabilitation as described elsewhere in this issue.

Where there's smoke...there may be bronchitis

"Recent research has delineated early, more subtle changes in lung and immune functions. These alterations directly predispose smokers to respiratory tract infection."

Am Fam Phys 1987;36:133-140

Ceclor® Pulvules® 250 mg
cefaclor

Established therapy for today's patients

For respiratory tract infections due to susceptible strains of indicated organisms

Brief Summary.
Consult the package literature for prescribing information.
Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae, Haemophilus influenzae,* and *Streptococcus pyogenes* (group A β-hemolytic streptococci).
Contraindication: Known allergy to cephalosporins.
Warnings: CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:
• Discontinue Ceclor in the event of allergic reactions to it.
• Prolonged use may result in overgrowth of non-susceptible organisms.
• Positive direct Coombs' tests have been reported during treatment with cephalosporins.
• Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
• Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
• Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:
• Hypersensitivity reactions have been reported in about 1.5% of patients and include morbilliform eruptions (1 in 100). Pruritus, urticaria, and positive Coombs' tests each occur in less than 1 in 200 patients. Cases of **serum-sickness-like** reactions have been reported with the use of Ceclor. These are characterized by findings of erythema multiforme, rashes, and other skin manifestations accompanied by arthritis/arthralgia, with or without fever, and differ from classic serum sickness in that there is infrequently associated lymphadenopathy and proteinuria, no circulating immune complexes, and no evidence to date of sequelae of the reaction. While further investigation is ongoing, **serum-sickness-like** reactions appear to be due to hypersensitivity and more often occur during or following a second (or subsequent) course of therapy with Ceclor. Such reactions have been reported more frequently in children than in adults with an overall occurrence ranging from 1 in 200 (0.5%) in one focused trial to 2 in 8,346 (0.024%) in overall clinical trials (with an incidence in children in clinical trials of 0.055%) to 1 in 38,000 (0.003%) in spontaneous event reports. Signs and symptoms usually occur a few days after initiation of therapy and subside within a few days after cessation of therapy; occasionally these reactions have resulted in hospitalization, usually of short duration (median hospitalization = two to three days, based on postmarketing surveillance studies). In those requiring hospitalization, the symptoms have ranged from mild to severe at the time of admission with more of the severe reactions occurring in children. Antihistamines and glucocorticoids appear to enhance resolution of the signs and symptoms. No serious sequelae have been reported.
• Stevens-Johnson syndrome, toxic epidermal necrolysis, and anaphylaxis have been reported rarely. Anaphylaxis may be more common in patients with a history of penicillin allergy.
• Gastrointestinal (mostly diarrhea): 2.5%
• Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
• As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
• Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.
• Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1% and, rarely, thrombocytopenia and reversible interstitial nephritis.

Abnormalities in laboratory results of uncertain etiology.
• Slight elevations in hepatic enzymes.
• Transient lymphocytosis, leukopenia, and, rarely, hemolytic anemia and reversible neutropenia.
• Rare reports of increased prothrombin time with or without clinical bleeding in patients receiving Ceclor and Coumadin concomitantly.
• Abnormal urinalysis; elevations in BUN or serum creatinine.
• Positive direct Coombs' test.
• False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinitest® tablets but not with Tes-Tape® (glucose enzymatic test strip, Lilly).

P.I.E.'s quality rating insurance program isn't for everyone, but it might be the best policy for you.

When it comes to professional medical liability insurance, one size doesn't fit all. If it did it would be too expensive. P.I.E. Mutual Insurance Company's Quality Rating Insurance Program (QRP) is designed to provide the best coverage for the best doctors at the best rate.

QRP FACTS:

Strict Underwriting Criteria – Not every applicant will qualify, but those who do will enjoy a substantial savings in premium costs. And they will reap the benefits of stable premiums in a volatile malpractice environment.

Scheduled Premium Reductions – Beginning in the second year, doctors who experience no payable loss will earn premium discounts, which can add up to a 30% reduction in premium costs over a five-year period. Insurance rates of individual members in a group practice are not affected by losses incurred by other members.

High Limits – Backed by our reinsurer, Lloyd's of London, P.I.E. is able to offer higher coverage limits for qualifying doctors: up to $7 million for individual doctors and $13 million for group policies. Lloyd's of London is the largest reinsurer in the world.

Designed With Input from Doctors – P.I.E.'s QRP plan is an innovative modified claims-made insurance specially designed with input from P.I.E.-insured doctors. Our claims-made program has taken the sting out of the tail endorsement. No additional premium is charged for an extended reporting endorsement, provided the physician does not leave the state to practice, or does not change insurance companies.

Do you qualify? Contact your P.I.E. representative, or our headquarters office today.

The Physician Rehabilitation Program of Maryland

Stanley R. Platman MD and Michael C. Llufrio CAC

Dr. Platman is Chief of Psychiatry and Vice-president for Medical Affairs at Homewood Hospital Center, Inc., as well as Chairperson of Med Chi's Physician Rehabilitation Committee. Mr. Llufrio is Director of Physician Rehabilitation, Med Chi.

The Physician Rehabilitation Program, under the auspices of Med Chi's Committee on Physician Rehabilitation, was established to assist physicians who are experiencing problems because of substance abuse, physical disability, or psychiatric illness.

Physician impairment is the inability to practice medicine with reasonable skill and safety because of physical or mental illness. Reliable analyses attribute three-fourths or more of physician impairment cases to substance abuse and addiction, either primary, or secondary to other underlying psychopathology or physical illness.[1] In 1956, the American Medical Association (AMA) passed a landmark policy stating that alcoholism was a medical disease.[2] In 1987, the AMA House of Delegates resolved that the American Medical Association endorse the proposition that drug dependencies, including alcoholism, are diseases and that their treatment is a legitimate part of medical practice.

In 1973, the AMA Council on Mental Health published a landmark study, "The Sick Physician."[3] The study suggested that as many as 3.2 percent of physicians suffer from alcoholism, 2 percent from drug abuse, and 1.3 percent from other mental disorders. Since this study, it has become evident that these findings were, unfortunately, a gross underestimation. Newer estimates of physicians impaired with mental illness and substance abuse range as high as 12 to 16 percent.[4]

As of 1984, every state medical society in the country had formed a committee for the purpose of:

- ensuring safe and competent patient care; and
- demonstrating concern for the welfare of the sick physician and his/her family.

These dual responsibilities are at times complementary and at other times conflicting. "The presence of an impairment doesn't mean that the physician is dangerous to patients. Quite often impairment precedes any obvious evidence of deterioration of a physician's practice. Left untreated, however, the inevitable consequence of physician impairment is bad patient care and dangerous patient care."[5]

The Committee on Physician Rehabilitation in Maryland was formed in 1978 as a committee of the Medical and Chirurgical Faculty of Maryland (Med Chi), the state medical society. A

full-time program director was hired in 1985 to ensure continuity and to provide much-needed manpower. Funding was obtained from a ten dollar assessment on the medical society membership fee and more recently, from a yearly donation by the Medical Mutual Liability Insurance Society of Maryland (Med Mutual). From the beginning, the services of the program were available to all licensed and non-licensed physicians and medical students in Maryland, but funding was very limited as was active outreach and meaningful preventive education. However, in its most recent session, the State Legislature included, at the request of the Med Chi Executive Committee, an amendment to SB 138 (the Board of Physician Quality Assurance bill) assessing all licensed Maryland physicians $50.00 to support the Physician Rehabilitation Program. This bill passed and was signed by Governor Schaefer, and will provide a significant infusion of funds. These resources mark a new era in the activities of the Physician Rehabilitation Program under the auspices of Med Chi's Committee on Physician Rehabilitation.

The Present Program

The Physician Rehabilitation Program in Maryland has grown gradually over the years, more rapidly since the hiring of a full-time Program Director (Table 1).

Although the growth is evident and all individuals contacting or being brought to the attention of the Program are investigated, the numbers do not reflect the expected incidence and prevalence of impairment to be found among physicians in Maryland. This is also true in all other states. There are many reasons for this finding. Many physicians are in treatment and never come to the attention of the Program unless they fail to comply with the care provided. A small number are reported directly to the Board of Physician Quality Assurance (BPQA) and only a few are referred to the Program from this source. However, the majority of impaired physicians fall into two groups and may never be identified. They are:

1. Impaired physicians who are *not recognized* and continue to practice at an impaired level.
2. Impaired physicians who *are recognized* by their colleagues, family, or staff but are *never reported* to the Physician Rehabilitation Program or the Board of Physician Quality Assurance.

The presence of the first group reflects the fact that many physicians are not aware of the significant signs that should make them suspect they are dealing with an impaired physician. Whereas no single sign is a warning, a pattern or cluster of signs should make us all "think impairment." It is more likely that a physician is apt to be recognized if he or she practices in a hospital. In the hospital setting, peer observation is increased and behavior is observed by many individuals. Suspicion may be raised by quality assurance activities, incident reports, patient or staff complaints, and risk management concerns. Certainly the following should be of concern:

- Changes in behavior
- Failures in responsibility
- Small errors
- Missing drugs
- Alcohol on breath
- Missed appointments
- Phone calls not returned
- Absenteeism, especially on Mondays
- Malpractice cases
- Friction with staff and peers

The continued existence of the second group of physicians creates harm by allowing the disease to progress unchecked. This often comes about due to a false belief that greater harm will occur by intervention and that, in any case, the decision should be that of the impaired physician. Physicians, like other people, often believe that the problem is a moral issue and that the impaired person will mend his or her ways. Unfortunately, all too often, impairment is a situation in which the physician is no longer capable of making wise choices. Denial is the normal response and many physicians respond by stating, "It's okay, I'm a doctor."

Table 1. Number of Physicians Reported by Year and Primary Impairment.

Primary Impairment	1980	1986	1989
Alcoholism	15	25	23
Drug Addiction	11	29	34
Psychiatric Illness	5	12	18
Physical Disability	0	4	1
Total	31	70	76

How Does the Program Work?

Confidentiality. Both federal and Maryland law protect the confidentiality of physicians referred to the Physician Rehabilitation Program.[6] However, there are limitations to this protection. Basically the Program is always faced with two major issues: confidentiality and dangerousness. In order for physicians to be protected by the right of confidentiality, it is essential that they be willing to enter into treatment and that they comply with the contract that is developed by the Program. If a physician is not compliant or is considered dangerous to self or others, confidentiality will be breached and the name of the physician will be forwarded to the Board of Physician Quality Assurance. This action follows accepted case law as outlined in the *Tarasoff v Regents of the University of California.*[7] In addition, Program staff may advise the person(s) who initially called, to report a physician directly to the BPQA if it is the staff's opinion on first contact that this physician is not interested in treatment and is an obvious, immediate danger to his or her patients.

By 1980, at least thirty-nine states had enacted some form of "sick doctor" statute. The requirements for reporting an impaired physician vary considerably from state to state. Some of these statutes allow report-

ing and others mandate it; immunity for good faith reporting is usually included in the statute. Reporting is generally made to the state's medical licensing board. New Jersey law mandates that hospitals and physicians report suspected incidents of gross incompetence or impairment to a nine-member Medical Practioners Review Board that operates under the state's Board of Medical Examiners. It should be noted that there is pressure in Maryland to enact similar mechanisms. There is a fear that the Physician Rehabilitation Program is protecting dangerous and incompetent physicians, and that the BPQA should be aware of all physicians under the auspices of the Rehabilitation Program. To date, this trend has been resisted and the Program has carefully examined its practices and contracts to assure that noncompliant and dangerous physicians are not protected inappropriately under the legislated, confidential protection clause.

In summary, the Physician Rehabilitation Program is not disciplinary in character and is confidential in practice. However, no physicians should believe that by entering into its domain, they will be protected from the consequences of being an imminent danger to their patients or to themselves.

Advocacy. The Committee on Physician Rehabilitation, through the Physician Rehabilitation Program, acts as an advocate for the impaired physician. It will loan treatment funds to those physicians whose impairment has depleted them of the financial capacity of obtaining treatment. Over 80 percent of these funds have been paid back, reflecting the excellent clinical outcome for most physicians entering into treatment under the auspices of the Committee. Med Chi was the first medical society to provide loans for impaired physicians in financial trouble.

The Physician Rehabilitation Program will also act as an advocate for a physician who is seeking employment or who is under threat of punishment from the BPQA. The Program will advocate for the restoration of the right to practice medicine in the state. Advocacy in these situations is based on how well the physician has done in the treatment program. Recovery is a long and sometimes painful process, and the ability to function again as a physician is an important motivation in the recovery process.

The Process. There are four phases to the program: investigation, evaluation, treatment, and monitoring. Investigation begins after the report is received. The report may be from the physician, other physicians, patients, family, and staff or it may be received anonymously. The greatest number of reports come from other physicians concerned about a specific physician. On receipt of the report, discrete inquiries are made to verify the information from several different sources. At times, problems arise at this initial level. The Physician Rehabilitation Program may get a report from a spouse of an impaired physician. However, he or she may state that Program staff cannot talk to the physician because the spouse fears the impaired physician's response.

If it appears that there is substance to the initial report, the physician is contacted and informed of the nature of the report and requested to come and meet some members of the Committee on Physician Rehabilitation. This evaluation is conducted to determine if there is a problem that needs attention. It is often immediately evident that the individual is impaired and he or she is anxious to be helped and to enter into treatment. In such circumstances, the physician will be referred to treatment (or may have already voluntarily entered into treatment), be requested to sign a customized contract, and a monitor (usually a Committee member) will be assigned to the case. The contract is usually for a five-year period, and penalties for relapse (e.g., report to the Board of Physician Quality Assurance) are built into it if the basic problem is one of substance abuse.

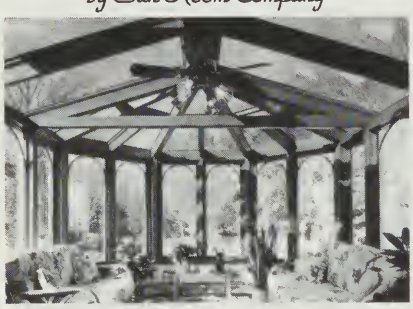
If the problem is not immediately evident or if the physician denies a problem, the physician is referred for consultation to an appropriate specialist. In these situations, the physician is requested to sign releases so that the Committee may obtain further information about him or her. Such releases are usually sent to the Chiefs of Service, the treating physicians or nonphysicians, and other significant informants. If substance abuse is suspected, the physician will be asked to provide a sample of urine during the initial evaluation. The suspected physician may attend this initial evaluation alone or bring family, significant others, or a lawyer. The philosophy behind the initial evaluation is one of helpfulness and honest communication. It is not intended to be an inquisition although it may appear that way to the physician since many individuals associated with the physician may be in attendance. If no problem is evident from the evaluation, the case is either dropped from active status or held open for continued monitoring.

On acceptance into the treatment phase, the impaired physician has to sign a contract with the Physician Rehabilitation Program. This contract outlines treatment expectations, urine testing if substance abuse is a problem, the role of the monitor, and the conditions that might lead to a report to the BPQA. If a relapse occurs, the first one is usually handled as a clinical issue and appropriate changes are made in the treatment plan. At this time it is common for the impaired physician to be referred to an inpatient program. A second relapse with alcohol or a drug may result in a communication to the BPQA. Behavior that is dangerous to the physician's patients is automatically forwarded to the BPQA. The Physician Rehabilitation Program has also produced a pamphlet, "To Disclose or Not to Disclose ..." This pamphlet provides guidelines to impaired physicians regarding difficult questions such as *who* to tell about their situation, *what* to tell their patients and colleagues, or how to explain a multi-week absence from their practice for treatment purposes.

The standard length of the treatment phase is now two years, but may be extended indefinitely if neces-

sary. Monitoring by a Committee member may be extended for a further three years and, therefore, the standard period of observation by the Committee is five years. Initial treatment may take place in an inpatient setting although increasingly this is not considered necessary. Treatment for problems of substance abuse also include random, collected urines, and regular attendance at Alcoholics Anonymous (AA) or Narcotics Anonymous (NA) meetings. The Monitor is an essential variable in the recovery of the impaired physician. The Monitor serves as both an observer and a helping hand. If a problem should arise, it is the responsibility of the Monitor to communicate this information to the Program Director or the Chairperson of the Committee. Table 2 shows the May 1990 status of the active case-load being followed by the Committee through the Physician Rehabilitation Program.

Special and New Issues



Hospitals taking local responsibility. Hospitals are increasingly concerned about the presence of impaired physicians. A number of them are establishing or have established committees to address this issue. In many ways they are replicas of the Med Chi Committee on Physician Rehabilitation and use it as a model, as well as a subsequent source of referral. To date, this process has been encouraged and it is the Committee's hope that with the new funding initiated on July 1, 1990, the Committee will be able to assist hospitals in developing physician rehabilitation programs.

Johns Hopkins Hospital will be the first in the nation to require its medical staff to undergo random alcohol and drug screening. (See Platman, S.R. p. 1015)

Table 2. Active Cases

Program Phase	Number	Percent
Investigation	8	9.3
Evaluation	8	9.3
Treatment	30	34.9
Monitoring	40	46.5
Total	86	100.0

Sex-related impairments. In recent months, there have been a small number of referrals to the Physician Rehabilitation Program for sex-related impairments. Individuals referred have generally already received criminal sentences for sexual relationships with patients; a variety of paraphilias with patients or non-patients; or incestuous relations with members of their families. They are referred for monitoring or for advocacy to regain their licenses to practice.

At this time, the Physician Rehabilitation Program continues to study the practice and standards required to monitor these physicians. It is evident that a number of these physicians are being treated with Depo-Provera and certainly some are no more difficult to monitor than physicians with a mental disorder. In contrast, others cannot be adequately monitored and this raises major concerns about supporting their return to practice even within a site that assures no contact with a vulnerable population.

Summary

The Physician Rehabilitation Program of Maryland has been developed by Med Chi's Committee on Physician Rehabilitation over the last twelve years. Its primary purpose is to assist physicians who are experiencing problems because of substance abuse, physical disability, or psychiatric illness. Rapid changes in the field have challenged the Committee in recent years. New funding which started in July of 1990 will assist Med Chi in meeting these new challenges.

Assistance for the impaired physician may be obtained by calling the Physician Rehabilitation Program at 301-539-0872, or in Maryland 1-800-492-1056. Or, leave a message on the 24 hour Helpline, 1-301-727-0120.

MARYLAND GENERAL PROFESSIONAL CENTER

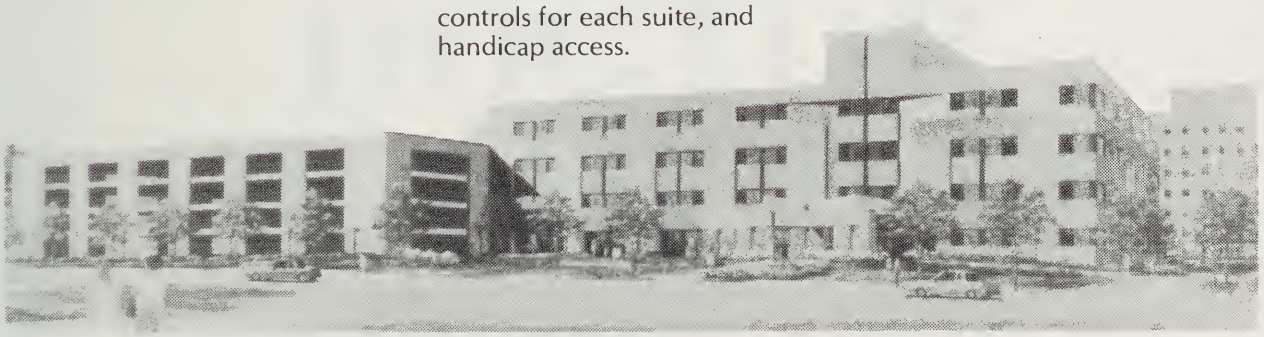
UPSCALE ENVIRONMENT. DOWNTOWN ACCESSIBILITY.

In response to the needs of medical professionals, we've built the Maryland General Professional Center. Reserved solely for the practice of medicine and related services, the center provides a professional atmosphere in a new, beautifully designed location for your practice.

• Central location is easily accessed by major traffic arteries from every direction, is served by the subway station at the State Office Complex, and is conveniently located adjacent to the planned light rail system.

• Conveniently located adjacent to Maryland General Hospital, within walking distance of hospitalized patients and specialized hospital services. Proximity improves coordination of care among patient, physicians and hospital.

• Reduced travel time between hospital and office for both physicians and patients.



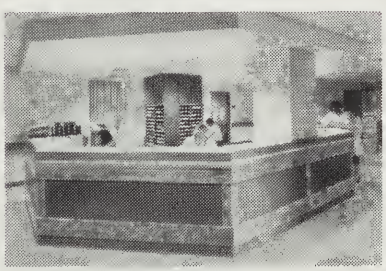
• Features include a patient dropoff at the main entrance, 2 elevators (1 sized to accommodate stretchers), sound-conditioned walls, thermostatic controls for each suite, and handicap access.

• Condominium arrangement offers office ownership benefits with low equity requirement. Also available are lease/purchase or leasing options.

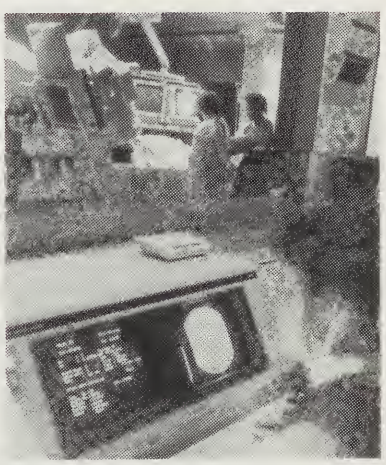
• Ample parking available in the enclosed 317-space garage adjacent to the building.

• Located near Meyerhoff Symphony Hall, Lyric Opera House and Center Stage.

For more information, a brochure and a personal tour, call
ROBERT HAUSSMANN,
Vice President for Corporate Development
(301) 225-8390.



The MRI Center offers physicians state-of-the-art diagnostic services with 24 hour report turn around and a voice retrieval system for instant access to dictated MRI reports from any telephone.



Maryland General Hospital is a 243-bed acute care facility serving the Baltimore metropolitan community for 108 years. Maryland General offers a comprehensive range of patient care services. We pride ourselves in the excellent quality in patient care and support services. Qualified professionals are dedicated to assisting the patient and family members during treatment and recovery. We provide this clinical support through the staff and services of many departments.

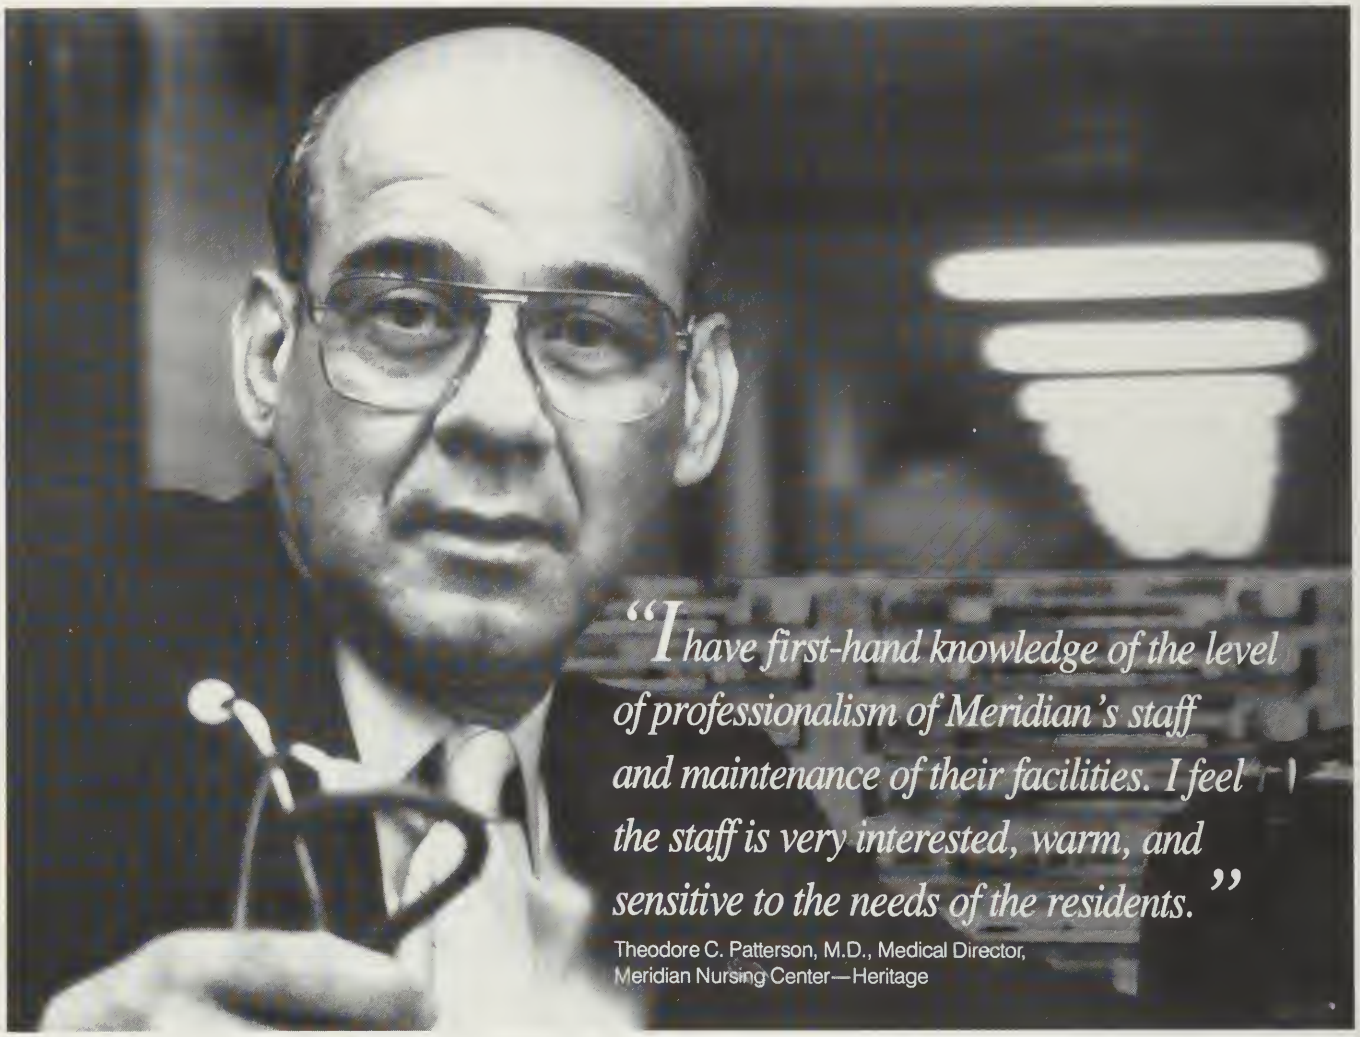
Your Day in Annapolis

DOCTOR OF THE DAY



Each year since 1964, *the Medical and Chirurgical Faculty* and its physician members staff the first aid facility at the state capitol during the General Assembly Session. This is made possible through the generous donation of one day of **your** time to serve in the first aid room located in the State House in Annapolis.

The first aid facility is open to legislators, their staffs and the public for the 90-day session. A registered nurse is on duty during this time. It is very important, however, that we provide a **"Doctor of the Day"** *each and every day* of the legislative session. As the Doctor of the Day, you are provided an opportunity to see firsthand the workings of the Maryland State Legislature while staffing the first aid facility.

Please take a moment to check your calendar and determine if you are able to donate a day of your time to the first aid facility in Annapolis. Preceding is a post card indicating the dates of the 1991 Legislative Session. Please fill out and return the card to Med Chi if you are able to serve. You will receive a confirmation card and then later a letter explaining when and where to report. (Please note, all Monday dates are *evening sessions* - beginning at 4:00 p.m. and ending at 9:00 p.m.)

Thank you for your interest and willingness to participate in this unique and valuable experience. For more information, call Berndette La Rue at Med Chi's Legal Department, 301-539-0872 or toll free in MD at 1-800-492-1056.

Maryland's 1991 Legislative Session
January 9 - April 8, 1991

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

Legal and Ethical Concerns of Your Medical Practice

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation, and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIII, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.

Dispensing Medications

I have received a number of calls recently regarding the ability of physicians to dispense medications. Therefore, I have delineated below the applicable legal sections pertaining to this issue.

Health Occupations Article Sec. 12-102 provides:

(a) *Definitions.*
  (1) In this section the following terms have the meanings indicated.
  (2) "In the public interest" means the dispensing of drugs by a licensed dentist, physician, or podiatrist to a patient when a pharmacy is not conveniently available to the patient.
  (3) "Personally preparing and dispensing" means that the licensed dentist, physician, or podiatrist:
    (i) is physically present on the premises where the prescription is filled; and
    (ii) performs a final check of the prescription before it is provided to the patient.

(b) *In general.* This title does not limit the right of an individual to practice a health occupation that the individual is authorized to practice under this article.

(c) *Preparing of prescriptions by a licensed veterinarian, dentist, physician, or podiatrist.* This title does not prohibit:
  (1) a licensed veterinarian from personally preparing and dispensing the veterinarian's prescriptions;
  (2) a licensed dentist, physician, or podiatrist from personally preparing and dispensing the dentist's, physician's, or podiatrist's prescriptions when:
    (i) the dentist, physician, or podiatrist:
      1. has applied to the board of licensure in this State which licensed the dentist, physician, or podiatrist;
      2. has demonstrated to the satisfaction of that board that the dispensing of prescription drugs by the dentist, physician, or podiatrist is in the public interest; and
      3. has received a written permit from that board to dispense prescription drugs, except that a written permit is not required in order to dispense starter dosages or samples without charge;
    (ii) the person for whom the drugs are prescribed is a patient of the prescribing dentist, physician, or podiatrist;
    (iii) the dentist, physician, or podiatrist does not have a substantial financial interest in a pharmacy; and
    (iv) the dentist, physician, or podiatrist:
      1. complies with the labeling requirements of Section 12-510 of this title;
      2. records the dispensing of the prescription drug on the patient's chart;
      3. allows the Division of Drug Control to enter and inspect the dentist's, physician's, or podiatrist's office at all reasonable hours;
      4. except for starter dosages or samples without charge, provides the patient with a written prescription, maintains prescription files in accordance with Section 12-505 of this title, and maintains a separate file for Schedule II prescriptions;
      5. does not direct patients to a single pharmacy in accordance with Section 12-403 (a) (7) of this title; and
      6. does not receive remuneration for referring patients to a pharmacy; or
  (3) a hospital-based clinic from dispensing prescriptions to its patients.

(d) *Dispensing drug samples.* This title does not prohibit:
  (1) a licensed veterinarian from personally dispensing a drug sample to a patient of the veterinarian; or
  (2) a licensed dentist, licensed physician, or licensed podiatrist from personally dispensing a drug sample to a patient of the licensed dentist, licensed physician, or licensed podiatrist if:
    (i) the sample complies with the labeling requirements of Section 12-510 of this title;
    (ii) no charge is made for the sample; and
    (iii) the authorized prescriber enters an appropriate record in the patient's chart.

(e) *Administering prescription drugs.*
  (1) This title does not prohibit a dentist, physician, or podiatrist from administering a prescription drug in the course of treating a patient.

(2) For the purposes of paragraph (1) of this subsection, "administering" means the direct introduction of a single dosage of a drug at a given time, whether by injection or other means, and whether in liquid, tablet, capsule, or other form.

(f) *Dispensing starter dosage of prescription drugs.*
(1) This title does not prohibit a dentist, physician, or podiatrist from personally dispensing a starter dosage of a prescription drug to a patient of the dentist, physician, or podiatrist, provided that:
(i) the starter dosage complies with the labeling requirements of Section 12-510 of this title;
(ii) no charge is made for the starter dosage; and
(iii) the dentist, physician, or podiatrist enters an appropriate record on the patient's chart.
(2) For the purposes of paragraph (1) of this subsection, "starter dosage" means an amount of drug sufficient to begin therapy:
(i) of short duration of 72 hours or less; or
(ii) prior to obtaining a larger quantity of the drug to complete the therapy.

(g) *Dispensing drugs at certain medical facilities or clinics.* This title does not prohibit a dentist, physician, or podiatrist from dispensing a prescription drug in the course of treating a patient:
(1) at a medical facility or clinic that specializes in the treatment of medical cases reimbursable through workmen's compensation insurance;
(2) at a medical facility or clinic that is operated on a nonprofit basis;
(3) at a health center that operates on a campus of an institution of higher education; or
(4) at a public health facility, a medical facility under contract with a state or local health department, or a facility funded with public funds.

(h) *Nonprescription sales by general merchants.* This title does not limit the right of a general merchant to sell:
(1) any nonprescription drug, medicine, or device;
(2) any commonly used household or domestic remedy; or
(3) any farm remedy or ingredient for a spraying solution, in bulk or otherwise.

(i) *Violations; penalty.* A dentist, physician, or podiatrist who fails to comply with the provisions of this section governing the dispensing of prescription drugs shall:
(1) have the dispensing permit revoked; and
(2) be subject to disciplinary actions by the appropriate licensing board.

Additionally, Health Occupations Article Sec. 12-510 (e) describes the labeling requirements for medications dispensed by authorized prescribers.

(1) Except as provided in this subsection, if an authorized prescriber dispenses medication, the prescriber shall label each container of the medication.
(2) In addition to any other information required by law, the authorized prescriber shall include on the label:
(i) the name and strength of the medication;
(ii) the date the prescription is dispensed;
(iii) the month and year when the medication expires, if known; and
(iv) any appropriate special handling instruction regarding proper storage of the medication.
(3) The labeling requirements of this subsection do not apply if the authorized prescriber dispenses the medication:
(i) to an inpatient in a hospital or related institution;
(ii) in an emergency situation; or
(iii) as a sample medication dispensed in the regular course of the authorized prescriber's practice.

Perhaps of greatest importance to physicians is Health Occupations Article Sec. 14-504 which provides:

(a) *In general.* Subject to the hearing provisions of Section 14-505 of this subtitle, the Board, on the affirmative vote of a majority of its full authorized membership, may reprimand any licensee, place any licensee on probation, or suspend or revoke a license if the licensee:

(29) fails to comply with the provisions of Section 12-102 of this article.

Physicians should realize that the regulations drafted in accordance with the above statutes have not been formally proposed in the *Maryland Register.* If you are interested in obtaining further information about this subject, please contact me at the Faculty office at (301) 539-0872, ext. 312, or 1-800-492-1056.

Chemotherapy For Advanced Nonsmall Cell Lung Cancer

The role of chemotherapy in nonsmall cell lung cancer (NSCLC) has been questioned by many investigators and lacks universal acceptance. Few of the large number of agents tested in phase II studies of NSCLC have shown significant single agent activity resulting in major responses in more than 15 percent of previously untreated patients. Nevertheless, many multidrug combinations developed to treat NSCLC have shown diverse results (Table 1). These results account, in part, for the poor acceptance of chemotherapy in the treatment of NSCLC in the past.

Recent studies, however, demonstrate that current chemotherapy regimens can improve survival in patients with advanced NSCLC. In a Canadian multicenter randomized trial, two chemotherapy regimens and a supportive care regimen were compared in 251 patients with advanced NSCLC.[1] Of the 233 eligible patients, fifty were treated with supportive care alone; ninety-one were treated with a vindesine/cisplatin (VP); and ninety-two received a combination of cyclophosphamide, doxorubicin, and cisplatin (CAP). Median survival was 32.6 weeks for VP, 24.7 weeks for CAP, and 17 weeks for best supportive care, indicating a statistically significant advantage with combination chemotherapy. Adding the costs of hospitalization and therapy, the authors found that the costs associated with best supportive care were no less than those for chemotherapy. In a randomized study of cisplatin and vindesine versus no chemotherapy, the difference in median survival not only favored chemotherapy (43 vs 26 weeks), but also reached statistical significance.[2] These studies suggest that appropriate combination chemotherapy does have a potential role in the management of advanced NSCLC.

Although cisplatin-based combination chemotherapy can produce a useful response and a significant prolongation of survival in patients with advanced NSCLC, more effective chemotherapy is clearly needed. Research continues to focus on the search for new therapeutic agents. A new class of compounds, the lipid soluble antifols which are analogous to methotrexate, include trimetrexate, piritrexim, and 10-EdAM (10-ethyl-10-deaza-aminopterin). These compounds are being investigated for their potential efficacy in patients with advanced NSCLC. An encouraging single agent response rate of 32 percent in patients with advanced NSCLC was observed using 10-EdAM in a phase II study. [3] This agent thus appears to be one of the most interesting and efficacious among those tested in NSCLC. Using 10-EdAM in combination with mitomycin-C and vinblastine (EMV) produced significant tumor regression in 59 percent of patients with advanced NSCLC in a pilot study recently completed at Memorial Sloan Kettering Cancer Center. [4] The median survival of all patients was 12.8 months. Treatment with EMV resulted in an improvement in symptoms and weight gain, and maintenance or improvement in performance status. This study also established that chemotherapy is justified in patients with advanced NSCLC. To further define the role of 10-EdAM in the management of NSCLC, a multi-institutional phase III study comparing the combination of mitomycin and vinblastine to the combination of mitomycin-C, vinblastine, and 10-EdAM is in progress; the University of Maryland Cancer Center is one of the participating institutions.

Other new agents that have shown promising results in the management of NSCLC are 5' nor-anhydrovinblastine (navelbine) with a single agent response rate of 33 percent [5] and CPT-11, a new camptothecin derivative, with a 41 percent response rate in chemotherapy-naive patients. [6] Further trials of these agents in combination with other drugs are in the planning stages and may further support the role of chemotherapy in NSCLC, thus offering a rational alternative to surgery and radiotherapy in patients with advanced disease.

With the availability of more effective agents with high response rates in NSCLC, and with results of randomized studies favoring chemotherapy, the controversy as to whether to treat or not to treat seems to have been resolved. Patients can be best served by participating in organized clinical phase II and III investigations, so that optimal therapy can be selected with the goal being improvement in quality of life and increase in overall survival.

Table 1. Selected Combination Chemotherapy Regimens for NSCLC

Regimen	Studies	Patients/Trial	% Response	Median Survival

INTRODUCING
PDQ FROM PDS
A rapid response system, specially designed to meet the new Medicare claims filing requirements.

Beginning September 1, 1990 and thereafter, all physicians and suppliers must file all claims for services for Medicare beneficiaries with the Medicare Carrier. If you are not now on electronic billing, this is the most opportune time to consider making the change. Our rapid response system, PDQ, automatically submits for your patients easily, efficiently and quickly. Our system provides tape billing for Blue Shield, Medicare and Medical Assistance. For a limited time, this package with equipment will be offered at special rates.

If You Are Looking For A High Quality Clinical Laboratory With A Strong Commitment To Personalized Service, Then Call . . .

SB

SmithKline Beecham
Clinical Laboratories

The One Lab For Your Clinical Testing Needs

Accurate Results

At SBCL, accurate results are no mistake. By constant checking and recalibration of equipment, blind submission of control samples, regular participation in federal, state and independent proficiency programs, and a multi-tiered quality control system that evaluates every phase of testing, we ensure you get accurate results – each and every test. And, our professional staff is available for consultation.

Service

From the top down, the people of SBCL take pride in meeting your individual needs.Whether it is the courtesy and knowledge of a client service representative, or the cooperation of your sales manager or help from a field service representative, you'll discover your needs are important to us. We also offer direct billing to insurance providers and continuing education programs.

Test Availability

SBCL offers over 1400 tests from the routine to the rare. With a trained staff and sophisticated instrumentation, we are able to respond rapidly to all your testing needs at our new facility located in Owings Mills, MD.

Med Chi members reading papers before organizations are invited to submit their papers to the MMJ *for consideration for publication.*

The *Maryland Medical Journal* is the monthly publication of the Medical and Chirurgical Faculty of Maryland. Its goals are educational and informative: the publishing of scientific articles and other technical information as well as editorials, special articles (evaluations, position papers, reviews of nonscientific subjects), membership news, notices of medical events, legislative and governmental news, meetings, continuing education courses, and programs and policies of the Faculty.

Manuscripts may be sent to Editor *MMJ*, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by the editor, editorial board members, and guest reviewers. The final decision is reserved for the Editor.

Specifications

When submitting manuscripts for review by *MMJ*'s Editorial Board, please send an IBM compatible floppy disk with the document entered in a Word Perfect, Multimate, or Wordstar program. At your request, *MMJ* will return your disk after your article is published or if your manuscript is not accepted. Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with margins of a least one inch. Number pages consecutively. Please submit two additional copies.

Include in the manuscript the concise title, full name of the author (or authors) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

An introductory synopsis/abstract of approximately 25-50 words is required.

Race, creed, color, national origin, or religion shall not be included in descriptions of case reports unless such information is a necessary contribution to clinical understanding.

Tables are to be typed on separate sheets of paper, numbered, and have a brief descriptive title. The Editor reserves the right to edit tables. Be sure that statistics are consistent in both tables and text.

References are limited to those citations noted in the text. References are to be typed double-spaced and numbered consecutively as they appear in text. They will be examined critically at the time of review and must be kept to a minimum. The number of references is generally limited to 20 in major contributions and fewer in shorter articles. Exceptions may be made if appropriate in the opinion of the reviewing editor. Personal communications and unpublished data should not be included. The following are necessary: names of all authors, complete title of article cited (lower case), name of journal abbreviated according to *Index Medicus*, volume number, first and last page numbers, and year of publication. For more extensive information about preparing medical articles for publication, the editors suggest the International Committee of Medical Journal Editors: Uniform requirements for manuscripts submitted to biomedical journals. The complete document is available in the June 1982 issue of the *Annals of Internal Medicine*.

Illustrations are material that cannot be set in type. *Photographic material* must be submitted as high-contrast, glossy prints. *Drawings and graphs* must be done professionally in india ink on high-grade white drawing paper or be computer generated. **Omit illustrations that do not increase understanding of text, and limit them to a reasonable number.** Four or fewer illustrations should be adequate for a manuscript of 4 to 5 typed pages. Identification should be typed on a gummed label and affixed to the back of each illustration: figure number, title of manuscript, name of senior author, and arrow indicating top. Legends for illustrations should be typed on a separate page with numbers corresponding to those on the photographs and drawings. **Cost of printing color photographs must be borne by the author.**

Recognizable photos of patients are to be masked and should carry with them written permission for publication.

Permissions. When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright. Material published in *MMJ* is protected by copyright and may not be reproduced without the written permission of both the principal author and *MMJ*.

Editorial Responsibility

Manuscripts are subject to editorial modification and such revisions necessary to bring them into conformity with *MMJ* style.

Galley proofs will be mailed to the principal author and, if not returned by the specified date, will be considered approved as typeset.

Statements made or opinions expressed by any contributor in any article or feature published in *MMJ* are the sole responsibility of the author. ■

Physician Placement Service
1211 Cathedral St., Baltimore, MD 21201-5585
(301-539-0872)

Physicians wishing to locate in Maryland are invited to submit a resume to be kept on file with the *Physician Placement Service*. Candidates are requested to inform the Faculty when they are no longer available for consideration for opportunities in Maryland. ***MMJ*** announcements on the Classified Advertising page for Physician Placement Service are charged at the regular Classified Advertising rate.

AMERICAN MEDICAL ASSOCIATION

Interactions
A Medical Staff Leadership Program

November 29, 1990
The Peabody Orlando
Orlando, Florida

Medical staff leaders may find that their special clinical skills and extensive clinical experience do little to prepare them for the complexities of this demanding role. A role that requires the skills and sensitivity of an arbitrator, facilitator, manager, advisor, negotiator, communicator, problem solver, peacemaker and professional peer.

To help you refine your personal style of leadership, develop your professional decision-making and problem-solving abilities, and enhance your repertoire of management skills, the AMA is pleased to offer Interactions, the 1990 Medical Staff Leadership Program. It offers ample opportunity for leadership skill-building, self-assessment, frank conversation and feedback.

Program Participants
If you are a new chief-of-staff, department director, committee chairman or you serve in any other leadership capacity, the AMA's new Interactions can provide you with the self-assurance and skills you need to be successful in this challenging new role.

Leadership Objectives
- Improve emerging medical staff leaders' understanding of skills needed to perform formal duties.
- Enhance the understanding of medical staff leadership conflicts inherent in today's healthcare scene.
- Increase ability to interact effectively with medical staff peers and hospital/governing body leadership.

Location and Date
The AMA Medical Staff Leadership Program will be conducted on Thursday, November 29, 1990, at the Peabody Orlando Hotel, in Orlando, Florida. For ease of accommodations and travel, the AMA offers the program one day prior to the 1990 Hospital Medical Staff Section Interim Meeting, and three days prior to the 1990 AMA Interim Meeting.

Registration
For immediate registration or information, **call toll-free 1-800-621-8335.** Please have your MasterCard or Visa ready.

Registration fee
AMA Member - $275
Non-member - $375

TO REGISTER CALL 1-800-621-8335

LYME HANDBOOK

Clinical manifestations, diagnosis and current & proposed treatment. 40 pgs. Send $8 payable to *LYME HANDBOOK*, c/o MD Lyme Support Group, 13151 Triadelphia Rd., Ellicott City, MD 21043.

YOUR SPECIALTY IS WORTH AN EXTRA $8,000 A YEAR.

If you're a resident in any of the following specialties:

- anesthesiology
- orthopedic surgery
- general surgery
- neurosurgery
- colon/rectal surgery
- cardiac/thoracic surgery
- pediatric surgery
- peripheral/vascular surgery
- plastic surgery

you could be eligible for an $8,000 annual stipend in the Army Reserve's Specialized Training Assistance Program.

You'll also be using your skills in a variety of challenging settings, from major medical centers to field hospitals, and there are opportunities for conferences and continuing education.

We know your time is valuable, so we'll be flexible about the time you serve. Your immediate commitment could be as little as two weeks a year, with a small added obligation later on. If you'd like to talk to an Army Reserve physician, or if you'd like more information about the stipend program or other medical opportunities, call our experienced Army Reserve Medical Counselor.

4,831 Of You Have Attended Our Risk Management Seminars.

There's Always Room For One More.

Informed consent, ICD-9-CM coding, medical record documentation, physician-patient communication, AIDS and medical practice, emerging medical technologies, financial planning, legal aspects of medical practice, insurance options, office staff procedures, health care politics in the 90's, to mention a few.

We offer an ongoing schedule of timely, relevant, and concise Risk Management programs for you and your office staff, each specifically designed around the extra skills you need in today's practice of medicine. Developed by our member physicians, the programs feature expert speakers, convenient locations, and CME credits. Some even include premium discounts.

Our seminar evaluations tell us that we're doing things right, and our attendance figures speak for themselves. We'll look forward to seeing you at an upcoming program.

There's always room for one more!

The Luxury Of Living Closer To Work Gives You More Time To Play.

Maplewood Park Cityhomes near area hospitals and golf courses.

Our priorities are right on par with yours at Maplewood Park. Just moments from Holy Cross, Suburban, and Shady Grove Hospitals, the tradition of luxury continues with Cityhomes by Mitchell & Best.

These low-maintenance homes, with enclosed brick courtyards, enjoy a high-profile setting just inside the Beltway at Old Georgetown Road. With a move to Maplewood Park you're on course to an easier way of life. Superior homes in a superior location. Maplewood Park. Prices from the low $400s.

C·I/*Mitchell & Best Company*

To visit; Take Old Georgetown Rd. N. past Cedar Lane. Turn right at Beech Ave. traffic light, to left on Montgomery Dr. to model homes on the left. Or use our Old Georgetown Rd. entrance, 1 block past Beech Ave. Phone (301) 530-8959. Open 11am-6pm, Sun.-Fri, and 10am-6pm Sat.

"We are pledged to the letter and spirit of U.S. policy for the achievement of Equal Housing Opportunity throughout the Nation. We encourage and support an affirmative advertising and marketing program in which there are no barriers to obtaining housing because of race, color, religion, sex, handicap, familial status, or national origin."

Making the right choices means asking the right questions.

You know the questions to ask your patients. Questions that will provide the information you need to make an informed decision about medical treatment.

When it comes to choosing a medical malpractice insurer, knowing which questions to ask--and how to interpret the answers--is no less important. Because just as your treatment decisions may have a lasting impact on your patient's long-term health, your choice of insurer may make all the difference to your professional and financial well-being in the years ahead.

In an uncertain medical situation, you might consult a specialist. When you're making decisions about insurance, why not consult with an insurance specialist? An expert who can suggest which questions to ask, guide you through the technical jargon, and help you select the coverage that's right for you.

That's where Princeton's network of independent insurance agents comes in. Our agents understand the insurance needs of health care professionals. They'll show you how to compare costs and benefits, and help you avoid gaps or duplications in coverage.

Do ask an agent why Princeton should be your choice. Ask about our financial strength, about our claims management philosophy that vigorously defends physicians against meritless claims...and about our new office package policy that offers protection for your practice and premises. We think you'll like the answers.

MALPRACTICE INSURANCE

It pays to review the alternatives

Do you know the answers to these questions?	Yes	No
*Do all carriers have the same success rate defending claims?	☐	☑
*Do all carriers have the same philosophy towards settling unjustified claims for their nuisance value?	☐	☑
*Are any carriers required to renew policies regardless of claims history?	☐	☑
*Do all carriers offer only claims made coverage?	☐	☑
*At retirement, do all carriers provide the same level of protection for the physician's lifetime?	☐	☑
*Do all carriers provide their physicians with the same quality of service?	☐	☑
*Are the premiums of all carriers pretty much the same?	☐	☑

No two carriers are alike. There are excellent alternatives available to all Maryland physicians. It is not too soon to begin a review of your malpractice policy. Contemporary Insurance Services is an independent agency that can advise you concerning all malpractice carriers. We serve hundreds of Maryland physicians and are committed to providing the best coverage at the best price. Don't buy blind. It pays to review the alternatives.

RECOMMENDATIONS OF THE ADVISORY COMMITTEE FOR ELIMINATION OF TUBERCULOSIS

The following recommendations are abstracted from the MMWR Vol.39/No. RR-8, May 18, 1990

THE USE OF PREVENTIVE THERAPY FOR TUBERCULOSIS INFECTION IN THE UNITED STATES

INTRODUCTION

The appropriate use of preventive therapy will play a crucial role in efforts to eliminate tuberculosis in the United States by the year 2010 (1). When taken as prescribed, isoniazid preventive therapy is highly effective in preventing latent tuberculosis infection from progressing to clinically apparent disease. In controlled trials conducted by the Public Health Service in ordinary clinical and public health settings, isolated preventive therapy reduced the incidence of disease by 54%-88% (2). Isoniazid preventive therapy was estimated to be 98% effective among children in Houston and in recently infected nursing home patients who were compliant with therapy (3,4). Isoniazid preventive therapy has been shown to be effective for long periods and to be reasonably cost-effective (5,6).

The following recommendations of the Advisory Committee for Elimination of Tuberculosis (ACET) are intended to increase the effective application of preventive therapy in the United States. Health department, medical and nursing schools, schools of public health voluntary agencies, and professional societies may use these guidelines to educate health-care providers about the appropriate use of preventive therapy in efforts to eliminate tuberculosis. The ACET recognizes that clinical decisions regarding preventive therapy must be individualized and based on an assessment of benefits and risks. These recommendations are intended to assist physicians and patients in making these decisions.

RECOMMENDATIONS

The main purpose of preventive therapy is to prevent latent (asymptomatic) infection from progressing to clinical disease (9). Such therapy also is used to prevent initial infections and to prevent recurrence of past disease.

High-Risk Groups

Certain groups within the infected population are at greater risk than others and should receive high priority for preventive therapy. In the United States, persons with any of the following six risk factors should be considered candidates for preventive therapy, regardless of age, if they have not previously been treated:

- Persons with human immunodeficiency virus (HIV) infection ($\geq$5 mm)* and persons with risk factors for HIV infection whose HIV infection status is unknown but who are suspected of having HIV infection.
- Close contacts of persons with newly diagnosed infectious tuberculosis ($\geq$5mm). In addition, tuberculin-negative ($<$5mm) children and adolescents who have been close contacts of infectious persons within the past 3 months are candidates for preventive therapy until a repeat tuberculin skin test is done 12 weeks after contact with infectious source.
- Recent converters, as indicated by a tuberculin skin test ($\geq$10mm increase within a 2-year period for those $<$35 years old; $\geq$15 mm increase for those $\geq$35 years of age).
- Persons with abnormal chest radiographs that show fibrotic lesions likely to represent old healed tuberculosis ($\geq$5mm).
- Intravenous drug users known to be HIV-seronegative ($\geq$10 mm).

***The criterion for a positive reaction to a skin test (in millimeters of induration) for each group is given in parentheses and is based on data cited in references 1-13.**

Pneumococcal Vaccine: Remember to immunize those 65 years and over, and those with chronic illness

- Persons with medical conditions that have been reported to increase the risk of tuberculosis (≥10 mm).

In addition, in the absence of any of the above risk factors, persons <35 years of age in the following high-incidence groups are appropriate candidates for preventive therapy if their reaction to a tuberculin skin test is ≥10 mm:

- Foreign-born persons from high-prevalence countries.
- Medically underserved low-income populations, including high-risk racial or ethnic minority populations, especially Blacks, Hispanics, and Native Americans.
- Residents of facilities for long-term care (e.g., correctional institutions, nursing homes, and mental institutions).

In addition to the groups listed above, public health officials should be alert for other high-risk populations in their communities. For example, through a review of cases reported in the community over several years, health officials may use geographic or sociodemographic factors to identify groups that should be targeted for intervention. Screening and preventive therapy programs should be initiated and promoted within these populations based on an analysis of cases and infection in the community. To the extent possible, members of high-risk groups and their health-care providers should be involved in the design, implementation, and evaluation of these programs. Staff of facilities in which an individual with disease would pose a risk to large numbers of susceptible persons (e.g., correctional institutions, nursing homes, mental institutions, other health-care facilities, schools, and child-care facilities) may be considered for preventive therapy if their tuberculin reaction is ≥10 mm induration.

Preventive Therapy

The usual preventive therapy regimen is isoniazid (10 mg/kg daily for children, up to a maximum adult dose of 300 mg daily). The recommended duration of isoniazid preventive treatment varies from 6 to 12 months of continuous therapy (9). Twelve months of therapy is recommended for persons with HIV infection and persons with stable abnormal chest radiographs consistent with past tuberculosis. The other groups should receive a minimum of 6 continuous months of therapy. To ensure that persons in high-risk groups comply with therapy, health-care personnel should, if necessary, directly observe the therapy. Isoniazid can be given twice weekly in a dose of 15 mg/kg (up to 900 mg) when therapy must be directly observed and resources are inadequate for daily therapy. Recommendations of the ACET are summarized in Table 1.

Patients should be thoroughly educated and should be monitored monthly, in person, by appropriately trained personnel. Isoniazid preventive therapy should not be prescribed if monthly monitoring cannot be done. Some data indicate that Black and Hispanic women, especially postpartum, may be at greater risk of serious or fatal adverse reactions, even when this risk is low, is as important as providing the benefits of preventive therapy. Additional details on preventive therapy have been published (9).

TABLE 1. Criteria for determining need for preventive therapy for persons with positive tuberculin reactions, by category and age group

Category	Age group (yrs)	
	<35	≥35
With risk factor*	Treat at all ages if reaction to 5TU purified protein derivative (PPD) ≥10 mm (or ≥5 mm and patient is recent contact, HIV-infected, *or* has radiographic evidence of old TB)	
No risk factor High-incidence group†	Treat if PPD ≥10 mm	Do not treat
No risk factor Low-incidence group	Treat if PPD ≥15 mm§	Do not treat

*Risk factors include HIV infection, recent contact with infectious person, recent skin-test conversion, abnormal chest radiograph, intravenous drug abuse, and certain medical risk factors (see text).

†High-incidence groups include foreign-born persons, medically underserved low-income populations, and residents of long-term-care facilities.

§Lower or higher cut points may be used for identifying positive reactions, depending upon the relative prevalence of *Myobacterium tuberculosis* infection and nonspecific cross-reactivity in the population.

SCREENING FOR TUBERCULOSIS AND TUBERCULOSIS INFECTION IN HIGH-RISK POPULATIONS

Recommendations of the Advisory Committee for Elimination of Tuberculosis

HIGH-RISK GROUPS

On the basis of published reports in the medical literature and CDC surveillance data, the Advisory Committee for Elimination of Tuberculosis (ACET) recommends that the following groups be screened for tuberculosis and tuberculosis infection:

- Persons infected with the human immunodeficiency virus (HIV).
- Close contacts of persons known or suspected to have tuberculosis, sharing the same household or other enclosed environments.
- Persons with medical risk factors known to increase the risk of disease if infection has occurred (see below).
- Foreign-born persons from countries with high TB prevalence.
- Medically underserved low-income populations, including high-risk racial or ethnic minority populations (e.g., Blacks, Hispanics, and Native Americans).
- Alcoholics and intravenous drug users.
- Residents of long-term-care facilities, correctional institutions, mental institutions, nursing homes/facilities, and other long-term residential facilities.

Flexibility must be maintained in defining high priority groups for screening. (Consult your local health department for local recommendations.)

GENERAL COMMENTS ON SCREENING

Screening is done to identify infected persons at high risk of disease who would benefit from preventive therapy, and to find persons with clinical disease in need of treatment. Therefore, appropriate follow-up, after initial screening, is essential.

Screening Methods

A detailed discussion of current screening methods for tuberculosis infection and tuberculosis can be found in the American Thoracic Society/CDC publication "Diagnostic Standards and Classification of Tuberculosis" (2).

Tuberculin skin testing is the standard method of identifying persons infected with M. tuberculosis. The intracutaneous administration of 5 units of purified protein derivative (PPD) tuberculin (Mantoux test) is the best means of detecting infection, although multiple-puncture devices may be used for screening large, low-risk populations.

Chest radiography or sputum smear examinations are the screening methods of choice only when the objective is intended to identify persons with current pulmonary disease and when the administration of preventive therapy to infected persons is not possible (e.g., among the homeless). In all screening programs, patients with signs and/or symptoms suggesting pulmonary or pleural tuberculosis should have a standard posterior-anterior chest radiograph, regardless of the tuberculin skin test result. Radiographic abnormalities suggestive of tuberculosis have been described in medical literature; however, tuberculosis may produce almost any form of pulmonary radiographic abnormality, especially in immunosuppressed persons (2).

RECOMMENDATIONS FOR SPECIFIC HIGH-RISK GROUPS

Persons with HIV infection and Intravenous Drug Users

Recommendations for screening individuals with HIV infection and intravenous drug abusers to determine the presence of tuberculosis infection have been published (3).

Tuberculin testing for persons with HIV infection should be conducted at the following sites:

- Tuberculosis and chest disease clinics
- Substance abuse treatment centers

- AIDS (acquired immunodeficiency syndrome) clinics
- HIV counseling and testing sites (including sexually transmitted disease [STD] clinics)
- Other facilities in which HIV testing is offered

Administrators of these facilities should ensure that the recommended screening is completed.

Contacts of Infectious Cases

Because close contacts of persons with tuberculosis are at extremely high risk of infection and disease, they should be identified within 3 days and examined within 7 days after the infectious index case has been diagnosed. Comprehensive guidelines for identifying, examining, and managing contacts of persons with infectious tuberculosis have been published (4). State and local health departments are responsible for ensuring that these monitoring activities are completed.

Persons with Other Medical Risk Factors

Health-care providers should tuberculin test all patients with medical risk factors that substantially increase the risk of tuberculosis. These medical risks factors include:

- Silicosis
- Gastrectomy
- Jejunoileal bypass
- Weight of 10% or more below ideal body weight
- Chronic renal failure
- Diabetes mellitus
- Conditions requiring prolonged high-dose corticosteroid therapy and other immunosuppressive therapy
- Some hematologic disorders (e.g., leukemia and lymphomas)
- Other malignancies

HAEMOPHILUS VACCINE NOW APPROVED FOR INFANTS

The Food and Drug Administration (FDA) has recently approved the Haemophilus b Conjugate Vaccine (diphtheria CRM_{197} Protein Conjugate) manufactured by Praxis Biologics, Inc., and distributed by Lederle Laboratories as HibTITER™ for use in infants as a three-dose immunization series at 2, 4, and 6 months of age, a two-dose series for children 7-11 months, and one dose for children 12-14 months of age. All of these infants and children should receive a booster dose of Hib conjugate vaccine at 15 months of age. The American Academy of Pediatrics Committee has recommended this schedule provisionally, and notes that any of the currenly licensed conjugate vaccines can be used for the booster dose at 15 months. For previously unimmunized children 15-60 months of age, one dose of Hib conjugate vaccine is still recommended (see table).

Because the peak incidence of bacterial meningitis caused by Haemophilus influenzae type b is in children less than one year of age, this recommendation change is particularly important. This recommendation is for HibTITER™ only at this time.

Ref. 1. MMWR 1990;39:698-9.

2. Am Acad Peds. News Release. 10/8/90.

Age	HibTITER Vaccine Recommendation*
2-6 months	1 dose at 2, 4, and 6 months; booster at 15 months of age
7-11 months	2 doses, 2 months apart; booster at 15 months of age
12-14 months	1 dose; booster at 15 months of age
15-60 months	1 dose

* Am. Acad. Peds. Committtee noted that any currently licensed conjugate vaccine can be used for booster dose at or after 15 months.

THERAPY THAT MAY BE AS SILENT AS HYPERTENSION ITSELF

VASOTEC is generally well tolerated and not characterized by certain undesirable effects associated with selected agents in other antihypertensive classes.

VASOTEC is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

A diminished antihypertensive effect toward the end of the dosing interval can occur in some patients.

For a Brief Summary of Prescribing Information, please see the last page of this advertisement.

FOR MANY HYPERTENSIVE PATIENTS
ONCE-A-DAY

VASOTEC®
(ENALAPRIL MALEATE | MSD)

Copyright © 1990 by Merck & Co., Inc.

VASOTEC®

(ENALAPRIL MALEATE | MSD)

VASOTEC is available in 2.5-mg, 5-mg, 10-mg, and 20-mg tablet strengths.

Contraindications: VASOTEC® (Enalapril Maleate, MSD) is contraindicated in patients who are hypersensitive to this product and in patients with a history of angioedema related to previous treatment with an ACE inhibitor.

Warnings: *Angioedema:* Angioedema of the face, extremities, lips, tongue, glottis, and/or larynx has been reported in patients treated with ACE inhibitors, including VASDTEC. In such cases, VASOTEC should be promptly discontinued and the patient carefully observed until the swelling disappears. In instances where swelling has been confined to the face and lips, the condition has generally resolved without treatment, although antihistamines have been useful in relieving symptoms. Angioedema associated with laryngeal edema may be fatal. **Where there is involvement of the tongue, glottis, or larynx likely to cause airway obstruction, appropriate therapy, e.g., subcutaneous epinephrine solution 1:1000 (0.3 mL to 0.5 mL), should be promptly administered.** (See ADVERSE REACTIONS.)

Hypotension: Excessive hypotension is rare in uncomplicated hypertensive patients treated with VASOTEC alone. Patients with heart failure given VASDTEC commonly have some reduction in blood pressure, especially with the first dose, but discontinuation of therapy for continuing symptomatic hypotension usually is not necessary when dosing instructions are followed; caution should be observed when initiating therapy. (See DDSAGE AND ADMINISTRATION.) Patients at risk for excessive hypotension, sometimes associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death, include those with the following conditions or characteristics: heart failure, hyponatremia, high-dose diuretic therapy, recent intensive diuresis or increase in diuretic dose, renal dialysis, or severe volume and/or salt depletion of any etiology. It may be advisable to eliminate the diuretic (except in patients with heart failure), reduce the diuretic dose, or increase salt intake cautiously before initiating therapy with VASDTEC in patients at risk for excessive hypotension who are able to tolerate such adjustments. (See PRECAUTIONS, *Drug Interactions* and ADVERSE REACTIONS.) In patients at risk for excessive hypotension, therapy should be started under very close medical supervision and such patients should be followed closely for the first two weeks of treatment and whenever the dose of enalapril and/or diuretic is increased. Similar considerations may apply to patients with ischemic heart disease or cardiovascular disease in whom an excessive fall in blood pressure could result in a myocardial infarction or cerebrovascular accident. If excessive hypotension occurs, the patient should be placed in the supine position and, if necessary, receive an intravenous infusion of normal saline. A transient hypotensive response is not a contraindication to further doses of VASOTEC, which usually can be given without difficulty once the blood pressure has stabilized. If symptomatic hypotension develops, a dose reduction or discontinuation of VASDTEC or concomitant diuretic may be necessary.

Neutropenia/Agranulocytosis: Another ACE inhibitor, captopril, has been shown to cause agranulocytosis and bone marrow depression, rarely in uncomplicated patients but more frequently in patients with renal impairment, especially if they also have a collagen vascular disease. Available data from clinical trials of enalapril are insufficient to show that enalapril does not cause agranulocytosis at similar rates. Foreign marketing experience has revealed several cases of neutropenia or agranulocytosis in which a causal relationship to enalapril cannot be excluded. Periodic monitoring of white blood cell counts in patients with collagen vascular disease and renal disease should be considered.

Precautions: *General: Impaired Renal Function:* As a consequence of inhibiting the renin-angiotensin-aldosterone system, changes in renal function may be anticipated in susceptible individuals. In patients with severe heart failure whose renal function may depend on the activity of the renin-angiotensin-aldosterone system, treatment with ACE inhibitors, including VASOTEC, may be associated with oliguria and/or progressive azotemia and rarely with acute renal failure and/or death.

In clinical studies in hypertensive patients with unilateral or bilateral renal artery stenosis, increases in blood urea nitrogen and serum creatinine were observed in 20% of patients. These increases were almost always reversible upon discontinuation of enalapril and/or diuretic therapy. In such patients, renal function should be monitored during the first few weeks of therapy.

Some patients with hypertension or heart failure with no apparent preexisting renal vascular disease have developed increases in blood urea and serum creatinine, usually minor and transient, especially when VASDTEC has been given concomitantly with a diuretic. This is more likely to occur in patients with preexisting renal impairment. Dosage reduction and/or discontinuation of the diuretic and/or VASOTEC may be required.

Evaluation of patients with hypertension or heart failure should always include assessment of renal function. (See DDSAGE AND ADMINISTRATION.)

Hyperkalemia: Elevated serum potassium (>5.7 mEq/L) was observed in approximately 1% of hypertensive patients in clinical trials. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was a cause of discontinuation of therapy in 0.28% of hypertensive patients. In clinical trials in heart failure, hyperkalemia was observed in 3.8% of patienfs, but was not a cause for discontinuation.

Risk factors for the development of hyperkalemia include renal insufficiency, diabetes mellitus, and the concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salt substitutes, which should be used cautiously, if at all, with VASOTEC. (See *Drug Interactions.*)

Surgery/Anesthesia: In patients undergoing major surgery or during anesthesia with agents that produce hypotension, enalapril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it can be corrected by volume expansion.

Information for Patients:

Angioedema: Angioedema, including laryngeal edema, may occur especially following the first dose of enalapril. Patients should be so advised and told to report immediately any signs or symptoms suggesting angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty in swallowing or breathing) and to take no more drug until they have consulted with the prescribing physician.

Hypotension: Patients should be cautioned to report lightheadedness, especially during the first few days of therapy. If actual syncope occurs, the patients should be told to discontinue the drug until they have consulted with the prescribing physician.

All patients should be cautioned that excessive perspiration and dehydration may lead to an excessive fall in blood pressure because of reduction in fluid volume. Other causes of volume depletion such as vomiting or diarrhea may also lead to a fall in blood pressure; patients should be advised to consult with the physician.

Hyperkalemia: Patients should be told not to use salt substitutes containing potassium without consulting their physician.

Neutropenia: Patients should be told to report promptly any indication of infection (e.g., sore throat, fever) which may be a sign of neutropenia.

NDTE: As with many other drugs, certain advice to patients being treated with enalapril is warranted. This information is intended to aid in the safe and effective use of this medication. It is not a disclosure of all possible adverse or intended effects.

Drug Interactions:

Hypotension: Patients on Diuretic Therapy: Patients on diuretics and especially those in whom diuretic therapy was recently instituted may occasionally experience an excessive reduction of blood pressure after initiation of therapy with enalapril. The possibility of hypotensive effects with enalapril can be minimized by either discontinuing the diuretic or increasing the salt intake prior to initiation of treatment with enalapril. If it is necessary to continue the diuretic, provide close medical supervision after the initial dose for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and DOSAGE AND ADMINISTRATION.)

Agents Causing Renin Release: The antihypertensive effect of VASOTEC is augmented by antihypertensive agents that cause renin release (e.g., diuretics).

Other Cardiovascular Agents: VASOTEC has been used concomitantly with beta-adrenergic-blocking agents, methyldopa, nitrates, calcium-blocking agents, hydralazine, prazosin, and digoxin without evidence of clinically significant adverse interactions.

Agents Increasing Serum Potassium: VASOTEC attenuates potassium loss caused by thiazide-type diuretics. Potassium-sparing diuretics (e.g., spironolactone, triamterene, or amiloride), potassium supplements, or potassium-containing salt substitutes may lead to significant increases in serum potassium. Therefore, if concomitant use of these agents is indicated because of demonstrated hypokalemia, they should be used with caution and with frequent monitoring of serum potassium. Potassium-sparing agents should generally not be used in patients with heart failure receiving VASOTEC.

Lithium: Lithium toxicity has been reported in patients receiving lithium concomitantly with drugs which cause elimination of sodium, including ACE inhibitors. A few cases of lithium toxicity have been reported in patients receiving concomitant VASOTEC and lithium and were reversible upon discontinuation of both drugs. It is recommended that serum lithium levels be monitored frequently if enalapril is administered concomitantly with lithium.

Pregnancy – Category C: There was no fetotoxicity or teratogenicity in rats treated with up to 200 mg/kg/day of enalapril (333 times the maximum human dose). Fetotoxicity, expressed as a decrease in average fetal weight, occurred in rats given 1200 mg/kg/day of enalapril but did not occur when these animals were supplemented with saline. Enalapril was not teratogenic in rabbits. However, maternal and fetal toxicity occurred in some rabbits at doses of 1 mg/kg/day or more. Saline supplementation prevented the maternal and fetal toxicity seen at doses of 3 and 10 mg/kg/day, but not at 30 mg/kg/day (50 times the maximum human dose).

Radioactivity was found to cross the placenta following administration of labeled enalapril to pregnant hamsters.

There are no adequate and well-controlled studies of enalapril in pregnant women. However, data are available that show enalapril crosses the human placenta. Because the risk of fetal toxicity with the use of ACE inhibitors has not been clearly defined, VASOTEC® (Enalapril Maleate, MSD) should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Postmarketing experience with all ACE inhibitors thus far suggests the following with regard to pregnancy outcome. Inadvertent exposure limited to the first trimester of pregnancy has not been reported to affect fetal oulcome adversely. Fetal exposure during the second and third trimesters of pregnancy has been associated with fetal and neonatal morbidity and mortality

When ACE inhibitors are used during the later stages of pregnancy, there have been reports of hypotension and decreased renal perfusion in the newborn. Oligohydramnios in the mother has also been reported, presumably representing decreased renal function in the fetus. Infants exposed *in utero* to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of blood pressure and renal perfusion with the administration of fluids and pressors as appropriate. Problems associated with prematurity such as patent ductus arteriosus have occurred in association with maternal use of ACE inhibitors, but it is not clear whether they are related to ACE inhibition, maternal hypertension, or the underlying prematurity.

Nursing Mothers: Milk in lactating rats contains radioactivity following administration of ^{14}C enalapril maleate. It is not known whether this drug is secreted in human milk. Because many drugs are secreted in human milk, caution should be exercised when VASOTEC is given to a nursing mother.

Pediatric Use: Safety and effectiveness in children have not been established.

Adverse Reactions: VASOTEC has been evaluated for safety in more than 10,000 patients, including over 1000 patients treated for one year or more. VASOTEC has been found to be generally well tolerated in controlled clinical trials involving 2987 patients.

HYPERTENSIDN: The most frequent clinical adverse experiences in controlled trials were: headache (5.2%), dizziness (4.3%), and fatigue (3%).

Other adverse experiences occurring in greater than 1% of patients treated with VASDTEC in controlled clinical trials were: diarrhea (1.4%), nausea (1.4%), rash (1.4%), cough (1.3%), orthostatic effects (1.2%), and asthenia (1.1%).

HEART FAILURE: The most frequent clinical adverse experiences in both controlled and uncontrolled trials were: dizziness (7.9%), hypotension (6.7%), orthostatic effects (2.2%), syncope (2.2%), cough (2.2%), chest pain (2.1%), and diarrhea (2.1%).

Other adverse experiences occurring in greater than 1% of patients treated with VASDTEC in both controlled and uncontrolled clinical trials were: fatigue (1.8%), headache (1.8%), abdominal pain (1.6%), asthenia (1.6%), orthostatic hypotension (1.6%), vertigo (1.6%), angina pectoris (1.5%), nausea (1.3%), vomiting (1.3%), bronchitis (1.3%), dyspnea (1.3%), urinary tract infection (1.3%), rash (1.3%), and myocardial infarction (1.2%).

Other serious clinical adverse experiences occurring since the drug was marketed or adverse experiences occurring in 0.5% to 1% of patients with hypertension or heart failure in clinical trials in order of decreasing severity within each category:

Cardiovascular: Cardiac arrest; myocardial infarction or cerebrovascular accident, possibly secondary to excessive hypotension in high-risk patients (see WARNINGS, *Hypotension*); pulmonary embolism and infarction; pulmonary edema; rhythm disturbances; atrial fibrillation; palpitation.

Digestive: Ileus, pancreatitis, hepatitis (hepatocellular or cholestatic jaundice); melena, anorexia, dyspepsia, constipation, glossitis, stomatitis, dry mouth.

Musculoskeletal: Muscle cramps.

Nervous/Psychiatric: Depression, confusion, ataxia, somnolence, insomnia, nervousness, paresthesia.

Urogenital: Renal failure, oliguria, renal dysfunction (see PRECAUTIONS and DOSAGE AND ADMINISTRATION).

Respiratory: Bronchospasm, rhinorrhea, sore throat and hoarseness, asthma, upper respiratory infection.

Skin: Exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, herpes zoster, erythema multiforme, urticaria, pruritus, alopecia, flushing, hyperhidrosis.

Special Senses: Blurred vision, taste alteration, anosmia, tinnitus, conjunctivitis, dry eyes, tearing.

A symptom complex has been reported which may include a positive ANA, an elevated erythrocyte sedimentation rate, arthralgias/arthritis, myalgias, fever, serositis, vasculitis, leukocytosis, eosinophilia, photosensitivity, rash, and other dermatologic manifestations.

Angioedema: Angioedema has been reported in patients receiving VASOTEC (0.2%). Angioedema associated with laryngeal edema may be fatal. If angioedema of the face, extremities, lips, tongue, glottis, and/or larynx occurs, treatment with VASDTEC should be discontinued and appropriate therapy instituted immediately. (See WARNINGS.)

Hypotension: In the hypertensive patients, hypotension occurred in 0.9% and syncope occurred in 0.5% of patients following the initial dose or during extended therapy. Hypotension or syncope was a cause for discontinuation of therapy in 0.1% of hypertensive patients. In heart failure patients, hypotension occurred in 6.7% and syncope occurred in 2.2% of patients. Hypotension or syncope was a cause for discontinuation of therapy in 1.9% of patients with heart failure. (See WARNINGS.)

Clinical Laboratory Test Findings:

Serum Electrolytes: Hyperkalemia (see PRECAUTIONS), hyponatremia.

Creatinine, Blood Urea Nitrogen: In controlled clinical trials, minor increases in blood urea nitrogen and serum creatinine, reversible upon discontinuation of therapy, were observed in about 0.2% of patients with essential hypertension treated with VASOTEC alone. Increases are more likely to occur in patients receiving concomitant diuretics or in patients with renal artery stenosis. (See PRECAUTIONS.) In patients with heart failure who were also receiving diuretics with or without digitalis, increases in blood urea nitrogen or serum creatinine, usually reversible upon discontinuation of VASDTEC and/or other concomitant diuretic therapy, were observed in about 11% of patients. Increases in blood urea nitrogen or creatinine were a cause for discontinuation in 1.2% of patients.

Hemoglobin and Hematocrit: Small decreases in hemoglobin and hematocrit (mean decreases of approximately 0.3 g% and 1.0 vol %, respectively) occur frequently in either hypertension or heart failure patients treated with VASOTEC but are rarely of clinical importance unless another cause of anemia coexists. In clinical trials, less than 0.1% of patients discontinued therapy due to anemia.

Other (Causal Relationship Unknown): In marketing experience, rare cases of neutropenia, thrombocytopenia, and bone marrow depression have been reported. A few cases of hemolysis have been reported in patients with G6PD deficiency.

Liver Function Tests: Elevations of liver enzymes and/or serum bilirubin have occurred.

Dosage and Administration: *Hypertension:* In patients who are currently being treated with a diuretic, symptomatic hypotension occasionally may occur following the initial dose of VASOTEC. The diuretic should, if possible, be discontinued for two to three days before beginning therapy with VASOTEC to reduce the likelihood of hypotension. (See WARNINGS.) If the patient's blood pressure is not controlled with VASOTEC alone, diuretic therapy may be resumed.

If the diuretic cannot be discontinued, an initial dose of 2.5 mg should be used under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*)

The recommended initial dose in patients not on diuretics is 5 mg once a day. Dosage should be adjusted according to blood pressure response. The usual dosage range is 10 to 40 mg per day administered in a single dose or in two divided doses. In some patients treated once daily, the antihypertensive effect may diminish toward the end of the dosing interval. In such patients, an increase in dosage or twice-daily administration should be considered. If blood pressure is not controlled with VASDTEC alone, a diuretic may be added.

Concomitant administration of VASOTEC with potassium supplements, potassium salt substitutes, or potassium-sparing diuretics may lead to increases of serum potassium (see PRECAUTIONS).

Dosage Adjustment in Hypertensive Patients with Renal Impairment: The usual dose of enalapril is recommended for patients with a creatinine clearance > 30 mL/min (serum creatinine of up to approximately 3 mg/dL). For patients with creatinine clearance ≤ 30 mL/min (serum creatinine ≥ 3 mg/dL), the first dose is 2.5 mg once daily. The dosage may be titrated upward until blood pressure is controlled or to a maximum of 40 mg daily.

Heart Failure: VASDTEC is indicated as adjunctive therapy with diuretics and digitalis. The recommended starting dose is 2.5 mg once or twice daily. After the initial dose of VASOTEC, the patient should be observed under medical supervision for at least two hours and until blood pressure has stabilized for at least an additional hour. (See WARNINGS and PRECAUTIONS, *Drug Interactions.*) If possible, the dose of the diuretic should be reduced, which may diminish the likelihood of hypotension. The appearance of hypotension after the initial dose of VASOTEC does not preclude subsequent careful dose titration with the drug, following effective management of the hypotension. The usual therapeutic dosing range for the treatment of heart failure is 5 to 20 mg daily given in two divided doses. The maximum daily dose is 40 mg. Once-daily dosing has been effective in a controlled study, but nearly all patients in this study were given 40 mg, the maximum recommended daily dose, and there has been much more experience with twice-daily dosing. In addition, in a placebo-controlled study which demonstrated reduced mortality in patients with severe heart failure (NYHA Class IV), patients were treated with 2.5 to 40 mg per day of VASOTEC, almost always administered in two divided doses. (See CLINICAL PHARMACOLOGY, *Pharmacodynamics and Clinical Effects.*) Oosage may be adjusted depending upon clinical or hemodynamic response. (See WARNINGS.)

Dosage Adjustment in Patients with Heart Failure and Renal Impairment or Hyponatremia: In patients with heart failure who have hyponatremia (serum sodium < 130 mEq/L) or with serum creatinine >1.6 mg/dL, therapy should be initiated at 2.5 mg daily under close medical supervision. (See DOSAGE AND ADMINISTRATION, *Heart Failure,* WARNINGS, and PRECAUTIONS, *Drug Interactions.*) The dose may be increased to 2.5 mg b.i.d., then 5 mg b.i.d. and higher as needed, usually at intervals of four days or more, if at the time of dosage adjustment there is not excessive hypotension or significant deterioration of renal function. The maximum daily dose is 40 mg.

Our Pictures Are Worth A Thousand Words.™

Case #12

74 year old female with history of memory loss, drowsiness and slurred speech. No history of hypertension.

DIAGNOSIS: ANEURYSM of the RIGHT ANTERIOR COMMUNICATING ARTERY [arrow] revealed by MRA — MAGNETIC RESONANCE ANGIOGRAPHY.

MRA provides a non-invasive, 3-dimensional study of the blood vessels without the use of contrast injection. Investigative studies report a 95% accuracy in diagnosing aneurysms as small as 3-4mm with MRA. Thus, MRA represents an extremely sensitive and safe screening examination for patients at risk for aneurysm. The MRA study is performed as an adjunct to cranial MRI and takes only an additional 8 minutes. MRA is also accurate in screening the carotid bifurcation region for atherosclerotic disease.

At Drs. Copeland, Hyman & Shackman, P.A. we are proud of our high resolution, state-of-the-art imaging. We look forward to consulting with you on any diagnostic imaging procedure in order to best serve you and your patients in the most expeditious and economic manner.

We provide convenient evening and weekend hours at both MRI locations, double-readings for quality assurance, and FAX capabilities for delivering reports immediately.

You work hard to gain your patients' trust and confidence. At Drs. Copeland, Hyman & Shackman, we'll help you keep it.

Executive Director's Newsletter

December 1990

DEA Number Requirement

On December 4, 1989, Blue Cross and Blue Shield of Maryland announced that subsequent to January 1, 1990 all prescription drug claims for state employees would be rejected if the prescriber's DEA number was not also submitted. Since that time, Med Chi has diligently tried to overturn such a policy for the following reasons:

- Some physicians do not possess DEA numbers and will, therefore, be unable to write prescriptions for eligible insurance beneficiaries.
- Physicians who do not have a DEA number should not be required to obtain one merely to comply with a state instituted policy which clearly contravenes federal guidelines regarding DEA number usage.
- Such a requirement will result in DEA numbers being circulated to more people which will subsequently result in a higher incidence of illegal drug diversion.

A letter from Margaret A. Brophy, Chief, Registration Unit, Drug Enforcement Administration, clearly delineates the DEA policy regarding dissemination of DEA numbers:

> It is the DEA's policy that a DEA registration number is unique and was designed to impose a "closed system" on the prescribing, dispensing and administering of licit controlled substances. **It is not intended to be an identification number. (Emphasis added).** The intended purpose of a DEA registration number is to provide a record of authorized possession and responsibility for a controlled substance in accordance with the Controlled Substances Act.
>
> The DEA does not endorse the use of a registration number by insurance companies or others for any reason inconsistent with its intended purpose. Prescriptions for controlled substances will, of course, display a DEA registration number, however, insurance companies or claim processors cannot demand a DEA registration number on a prescription for a non-controlled substance."

Although Med Chi representatives have been told that this policy will be reviewed, no definite resolution has occurred. If you or any of your patients have experienced problems in complying with this requirement or agree that it is an inappropriate use of the DEA number, please send a letter to Med Chi's legal department addressing your concerns.

Maryland Medical Journal Index

This issue of the *MMJ* features the annual index for 1990. This index includes listings by author and by topic to assist you in referencing material published over the past year.

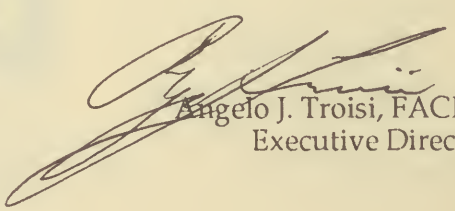
Physician's Practice Digest

In late October, Med Chi introduced the *Physician's Practice Digest (PPD)* a publication that addresses issues related to the business concerns of practicing physicians. To best meet the needs of its membership, Med Chi is interested in incorporating your ideas about this publication in future issues. If you have any suggestions, opinions, or an interest in contributing articles to the *PPD*, please send correspondence to Editor, *Physician's Practice Digest*, 1211 Cathedral Street, Baltimore, MD 21201.

Straight Forward

In early November, all licensed Maryland physicians received copies of *Straight Forward*, a newspaper designed to inform physicians about news and information related to drug and alcohol rehabilitation. The official publication of the Physician Rehabilitation Committee in cooperation with the Med Chi Alliance Against Drug Abuse (MAADA), *Straight Forward* will feature guest columns written by experts in the field of substance abuse and will also serve as a forum for readers with questions and ideas about specific drug and alcohol addiction topics. If you have any suggestions, opinions or an interest in contributing articles to *Straight Forward*, please write to Vivian Smith, Managing Editor, *Straightforward*, 1211 Cathedral Street, Baltimore, MD, 20201 or call 301-539-0872 or 1-800-492-1056.

Med Chi Handbook, Bylaws and Compendium



Copies of the Med Chi *Handbook* for 1990-1991, the May 1990 edition of the *Bylaws* and the 1990 edition of the *Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Maryland* are now available for all Med Chi members. For a free copy of any of these publications, contact Med Chi's Communications Department at 301-539-0872 or 1-800-492-1056.

Doctor/Lawyer/ Teacher Partnership Against Drugs

More than 100 Maryland physicians have volunteered to participate in the Doctor/Lawyer/Teacher Partnership Against Drugs, a new program that will bring doctor/lawyer education teams into schools to discourage 7th graders from using drugs. The program is essentially a "rap-session" where physicians talk with students about the physical dangers of drug abuse and lawyers emphasize the legal consequences of using drugs. Additional physician volunteers are urgently needed to participate in this effort. To volunteer, contact your local component society or call Betsy Newman in the Public Relations Department at 301-539-0872 or 1-800-492-1056.

Pneumococcal Vaccine

Adele Wilzack, Secretary, Maryland Department of Health and Mental Hygiene, is requesting all physicians in Maryland to provide pneumococcal vaccine as a preventive measure to all patients over 65 and others with chronic medical conditions. Physicians are encouraged to stock this vaccine and make it available in their office. The vaccine has a two-year shelf life (two years from the date of manufacture) and its cost is covered by Medicare. The CPT code for pneumococcal vaccine, polyvalent, is 90732. It is important to immunize children as well as adults over 65.

Angelo J. Troisi, FACHE
Executive Director

How to Respond to a PRO Quality Inquiry

Background

As of April 1, 1989, Utilization and Quality Control Peer Review Organizations, commonly known as PROs, have entered into "The Third Scope of Work," i.e., the third round of PRO contracts negotiated between the Health Care Financing Administration (HCFA) and the nation's 54 PROs. Despite new contractual provisions in the Third Scope of Work, PROs still have as their primary responsibility the medical review of services reimbursed by Medicare. PROs review such services to ensure that they are: (a) medically necessary, (b) provided in an appropriate setting and (c) meet professionally recognized standards of care.

Quality Intervention Plan under the Third Scope of Work

Cases selected for review by PROs under the Third Scope of Work are passed through six generic quality screens, identical to those used in the Second Scope of Work. However, the Third Scope of Work rules also require the implementation of a Quality Intervention Plan (QIP). Under the QIP, each PRO is required to perform a quality review and implement interventions when quality concerns are identified. The following is an overview of the QIP:

- Every case selected for retrospective review is screened for potential quality problems.
- If a potential quality problem is identified, the QIP requires the PRO to allow 30 days for the physician and/or provider to comment on the proposed quality problem.
- A PRO physician reviews comments submitted within the specified time frames in order to confirm or resolve the potential quality problem.
- When the PRO determines that there is a confirmed quality problem, the PRO must identify the source of the problem and notify the affected party of the final determination. The notice to the responsible party must include sufficient detail so that he/she will clearly understand the identified problem, what the appropriate action should have been in the case, the severity of the problem, and the action to be taken to resolve the quality problem, if appropriate.
- A PRO physician must assign a severity level to each case with a confirmed quality problem. The three-level severity system is based upon the degree of harm or potential for harm to the patient. This system was developed with the assistance of physicians representing the major medical specialty societies.

The three levels are:

- Confirmed quality problem with significant adverse effects on the patient (Level III);
- Confirmed quality problem with the potential for significant adverse effects on the patient (Level II); and
- Confirmed quality problem without the potential for significant adverse effects on the patient (Level I).

"Significant adverse effect" is defined as (1) patient management which results in anatomical or physiological impairment, disability, or death, or (2) unnecessarily prolonged treatment, complications or readmission.

- Each case with a confirmed quality problem is assigned a weight based upon the severity level of the problem. Each severity level has an assigned weight, from a weight of 25 for a Level III problem, to a weight of 5 for a Level II problem, to a weight of 1 for a Level I problem.

Each quarter the PRO will profile the total weights accumulated for reviews completed in that quarter by problem source (e.g., physician and provider). The total weight will determine the corrective action to be implemented. When the quarterly profile shows that a particular physician has a total weighted score of three points or more, the PRO must initiate corrective action. The Third Scope of Work states that when a severity Level II or III potential quality problem is identified or a pattern of severity Level I potential quality problems is identified, the responsible party (i.e., the physician and/or provider as appropriate) will be notified of the potential quality problem and provided with an opportunity to respond and discuss the issue with a PRO physician. The initial notification should include sufficient detail so that the responsible party will clearly understand the identified problem and the severity of the problem.

How to Respond

Following is a list of steps to take if you receive a letter of inquiry regarding quality concerns from your PRO:[1]

Step 1: Remain calm. Do not send angry letters back to the PRO; discuss the quality issue with a peer.

Step 2: Review the medical record to make sure the PRO hasn't made a factual error in its review of the case. The PRO may have overlooked a critical entry in the medical record.

Step 3: Do not call your PRO unless there is some clear advantage to doing so. A preferred course of action is to write to your PRO, with a copy to the chief of the hospital medical staff, component medical society and Med Chi's PRO Monitoring Committee.

In your communication with your PRO, present factual information without self-serving statements, argumentative remarks, explicit or implicit admissions of error in judgment, or criticism of care provided by others.

Step 4: You may request a personal interview with the district medical director and specialist consultant prior to writing a response. A personal interview may be more appropriate than writing, particularly in a complicated case.

Step 5: Keep your response and all other communications in a separate file other than the patient's medical record. Therefore, this information will not be inadvertently disclosed if the medical record is produced in response to a subpoena.

As always, detailed histories and patient records are important to keep. They help you to remember clearly relevant facts involved in the treatment and the course of the treatment.**

One Minute With Diabetes

Meal Planning

Doctor, please help me with my meal plan. My height is 62 inches and my weight is 160 lbs when it should be 100 lbs. Both my blood cholesterol and blood glucose are elevated. Looking after four children and running a household give me plenty of exercise. The 1500 calorie meal plan given to me by the dietitian requires me to purchase or prepare special foods and to read package labels that do not make sense. Should I have a second appointment with the dietitian for more instruction?

There is not a single meal plan that suffices to treat satisfactorily all individuals with diabetes. Diabetes does not require special foods - just the same nutrients, vitamins, and minerals as the non-diabetic members of the family. The fundamental principles of nutrition that apply to healthy people apply to those with diabetes. The most important dietary concept concerns total caloric intake. In youth, caloric intake must be sufficient to assure normal growth, development, and maturation. For adults with obesity, the total caloric intake must be reduced. Even small amounts of weight loss will lower both blood glucose and cholesterol levels.

Some diet maxims:

1. At total bed rest, an adult requires about 1600 calories per day.
2. To lose one pound of body weight over a period of one week, one must consume 3500 calories less than what is needed to maintain the usual weight (500 calories per day for one week).
3. The average adult requires about six hours of dietary instruction to be able to understand and apply the fundamental principles of meal planning and package label interpretation.
4. Daily exercise, such as walking up 20 flights of stairs, will consume approximately 70 calories (equivalent to one slice of bread) and produce one ounce of body weight loss per week. Walking consumes about 100 calories per mile.
5. The most important thing that can be learned from a weight loss program is good eating habits.

Our problem patient today - diabetic, obese, and with hypercholesterolemia - fortunately recognizes that she does not understand her meal plan and wants to do something about it. Since her history suggests an active person, it is reasonable that basic caloric needs might be 2000 calories per day. If she is instructed in the use of a 1200 calorie meal plan and adheres to it, she would have a deficit of 5600 calories per week. This would bring about a weight loss of almost two pounds per week on average. Body fluid adjustments and activity would be factors causing variations in the program.

Present thinking is that the 1200 calorie meal plan should be approximately 30 percent fat (360 calories), 50 percent carbohydrates (600 calories) and 20 percent protein (240 calories). The dietitian will recommend food selections based on ethnic and personal likes and dislikes. He or she will advise patients about serving sizes and exchanges, and assist them in reading and interpreting package labels in order to determine acceptable carbohydrate and lipid content. Sodium restriction is often needed and can easily be incorporated into the basic instruction. A poor method of meal preparation can double its caloric content. Thus, appropriate methods of food preparation should be discussed. Good dietary instruction utilizes visual aids and should include individual and group instruction. Practice classes in "eating out in a restaurant" or "eating in a cafeteria" can be helpful.

Physicians should have a list of qualified dietitians working in the area of their practice to whom they can refer patients for instruction. Adequate diet instruction is often expensive and frequently not covered by insurance programs, but it is essential for the proper management of all diabetic patients, especially those with hyperlipidemia.

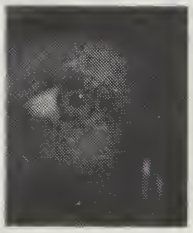
Intensification of Adjuvant Chemotherapy in Patients with Primary Breast Cancer and Positive Axillary Nodes

During the past two decades, irrefutable evidence has been obtained from a number of trials to indicate that the administration of systemic chemotherapy after operation has benefited patients with primary breast cancer. The results from these studies are largely responsible for the therapeutic focus in breast cancer treatment since 1958. There is universal agreement, however, that a need exists for enhancing the effectiveness of postoperative chemotherapy. Despite manipulations of doses, schedules, and combinations of drugs, progressively better disease-free survival and survival have not been observed. Numerous hypotheses have been formulated to explain why such improvements have not occurred in spite of the major efforts exerted toward accomplishing these goals. Foremost among them is the contention that inadequate drug dose administration is a major factor responsible for the failure to achieve a greater therapeutic effect in responsive tumors.

In an article published in 1984,[1] Hryniuk and Bush presented compelling arguments for recognizing the importance of dose intensity in the use of chemotherapy for metastatic breast cancer. They defined dose intensity as the amount of drug administered per unit of time, expressing intensity as mg/m^2/week using a single drug regimen. For the determination of dose intensity using regimens containing several drugs, they used certain calculations and assumptions but still expressed the intensity of the regimen as mg/m^2/week, assuming that "each of the various drugs in a combination has equivalent activity and that the major effect of scheduling is to vary the total amount of drug delivered per unit of time." Hryniuk and Bush considered that differences in drug scheduling can be ignored except insofar as dose intensity is varied. Their retrospective review and analysis of the literature led them to conclude that the higher the dose intensity, the higher the remission rate of patients with advanced breast cancer. They also emphasized the fact that when *actual* rather than *projected* doses were used in their calculations, the relationship between response rate and dose intensity became even more evident. Their concept was established using information obtained by other investigators from nonrandomized studies that were not originally carried out to assess the issue of dose intensity. Results from several recently reported randomized trials are purported to support the Hryniuk thesis.[2] A study by Tannock et al is most significant in that regard,[3] in that it reports results from a prospectively randomized trial conducted to test the relationship between two dose levels of cyclophosphamide, methotrexate, fluorouracil (CMF) and the remission rate in patients with advanced breast cancer.

Using the same approaches that they employed for evaluating dose intensity in advanced disease, Hryniuk and his associates correlated the dose intensity of adjuvant chemotherapy with relapse-free survival.[4,5] Their retrospective review of the literature led them to conclude in 1986 that, as in advanced disease, dose intensity of chemotherapy correlated with relapse-free survival and that this correlation was independent of the number of positive nodes or menopausal status.

It is generally agreed that high-dose chemotherapy and marrow transplant is an appropriate experimental clinical approach for the treatment of advanced metastatic breast cancer. However, it is also reasonable to examine the worth of a chemotherapy intensification approach in earlier stage disease where chances for cure may be greater and where treatment short of marrow transplant would be more appropriate.



To evaluate the effect of dose intensification and increased cumulative dose of adjuvant chemotherapy, the National Surgical Adjuvant Breast/Bowel Project (NSABP) has initiated protocol B-22. Patients who have a histologically-proven primary operable breast cancer, and who have been found, postoperatively, to have one or more histologically-positive axillary lymph nodes but who have no evidence of distant metastases, will be randomized to receive one of the following three regimens: (1) Adriamycin 60 mg/m^2 and cyclophosphamide 600 mg/m^2 I.V. every twenty-one days for four courses. (2) Adriamycin 60 mg/m^2 I.V. every twenty-one days for four courses and cyclophosphamide 1200 mg/m^2 I.V. every twenty-one days for two courses, i.e., on days 1 and 22. No more cyclophosphamide will be given during the third or fourth doses of adriamycin. (3) Adriamycin 60 mg/m^2 and cyclophosphamide 1200 mg/m^2 I.V. every twenty-one days for four courses. In all three regimens, patients who are fifty years of age or older, receive tamoxifen 10 mgm orally twice a day beginning on day one, and are to be continued for five years.

The Surgical Oncology Program at the University of Maryland, being an active member of NSABP, is seeking large patient accrual throughout the state of Maryland and from the surrounding states to be treated according to these studies. Such patients can be treated in their community, by their own physicians, under the guidelines of the NSABP. I highly recommend that negative lymph node patients be admitted on a controlled study to find the most effective therapy.

Chinese Medicine and Politics: Mao to Tiananmen

Caryl E. Peterson PhD and Ronald G. Peterson MD

Dr. Caryl Peterson is Associate Professor of Biology and Chairperson of the Premedical Committee at Towson State University. Dr. Ronald Peterson, a gynecologist practicing in Timonium, is affiliated with Greater Baltimore Medical Center.

The experience of China during the last forty years demonstrates that the availability and quality of medical care is inexorably tied to the political scene.

Entering China in October 1989, forty years after the founding of the People's Republic and just four months after the suppression of the prodemocracy movement in Tiananmen Square, our interest in healthcare and medical education intertwined with curiosity and concern about the political nature of this great nation. What impact have political changes during the last forty years had on the healthcare of one quarter of the world's population? What effect will the incidents at Tiananmen have on the lives of those now in the academic and medical corridors of China? What can be learned from the Chinese medical experience which may have application elsewhere?

Liberation to 1966

In 1949, Mao Zedong and his followers overthrew the ruling Kuomintang forces of Chiang Kai-shek and established the People's Republic of China. As a result of the ravages of the Japanese occupation and the ensuing socioeconomic chaos of the 1940s, Mao inherited a healthcare system incapable of meeting the needs of the new Republic. Infectious, parasitic, and nutritional diseases, sustained by the poverty endured by the vast majority of the population, racked the country. China was considered the "sick man of Asia" with an average life expectancy of 32 years, a crude death rate of 25 per 1,000 population, and an infant mortality rate of 200 per 1,000 live births. Only 80,000 hospital beds were available for a population of 540 million.[1-3]

The twenty-two medical colleges of China were located primarily in the large cities and were operated by the state, private enterprise, or missionaries and foreign organizations. Curricula varied according to the nationality and goals of the sponsoring group and provided medical training lasting four to eight years. Of the nearly 600,000 physicians in China in 1949, only 38,000 had been schooled in western medicine.[2] The others practiced traditional Chinese medicine learned chiefly through apprenticeship. Many provinces had no qualified physicians.[4]

In the fifteen years following the revolution, the Communist regime in China formulated a central policy for improving medical care. Attention focused on the needs of workers, peasants, and the military. Health services were redistributed to provide better access for the 80 percent of the population living in rural areas. Emphasis was placed on preventive medicine, and programs were initiated to train more physicians and primary healthcare workers.

By 1952, existing medical colleges were expanded, relocated, and reorganized. The number of medical schools increased from 22 to 116 with each province of China having at least one.[4] Beginning in 1954, entrance to medical school was determined by national examination of students graduating from high school. A uniform five-year curriculum was established.

To augment the supply of physicians, "secondary medical schools" were founded. Students were accepted with the equivalent of a ninth grade education. After completing three years of study, they graduated with similar training but more autonomy than physician's assistants in this country.[3] These graduates staffed commune and factory health facilities.

One of the most creative innovations of the Mao era was the establishment, in 1965, of a corps of "barefoot doctors" (renamed "countryside doctors" in 1985 by the Chinese Ministry of Health)[5] to serve the rural population. The program, initiated in the Chuan Sha rice growing region near Shanghai, gave training in public health and primary care to lower middle class peasants.[5] The average age of these barefoot doctors was twenty-three, 50 percent were female, and most had only a primary or middle school education.[6] After completion of three to six months of instruction and clinical experience, they were sent to the countryside to diagnose and treat minor illnesses, give home care to the chronically ill or senile, monitor sanitation, dispense drugs, administer immunizations, provide maternal and child care, and assist in health education.

Under the rural cooperative system developed during the 1960s, peasants were organized into production teams (a natural village of 100-200 workers), work brigades averaging 1,000 people each, and communes (the townships) averaging 16,000 people. Barefoot doctors, like other peasants, received from the cooperative unit a salary based on the number of work points accumulated for each working day. Healthcare was financed through insurance provided by the welfare fund of the work brigade and supplemented by small monthly payments from each peasant.

Cultural Revolution

The Great Proletarian Cultural Revolution was launched in 1966. A surge of anti-intellectualism and an emphasis on the immediate improvement of the life of the worker and peasant resulted in great turmoil in China and destruction of much of its cultural heritage. Schools, universities, and medical colleges were closed. Medical students were graduated whether or not their training was complete. They and their professors were sent to the countryside to provide medical care, learn from the peasants, and be politically re-educated.[7] Researchers were assigned menial clinical tasks and publication of medical journals ceased. Hospitals were administered by soldiers, nurses, and junior staff of the correct political persuasion. Health expenditures for the urban population were reduced by 40 percent, and in many provinces as much as 75 percent of the funds were shifted to rural health programs.[2]

In 1972, medical colleges were reopened but their curriculum was limited to three years. Students were admitted from junior middle school with selection based, in part, on political considerations. Grades and examinations were eliminated as "punitive tools designed to baffle students."[2] Once admitted, no student failed to graduate except for health reasons.[1] "Even if these doctors haven't much talent," said Mao, "they would be better than the quacks and witch doctors, and the villages would be better able to afford to keep them."[8]

The cultural revolution endorsed and encouraged traditional medicine. Herbal drugs were cheaper and more readily available than western medications, and traditional physicians were already well established in rural areas. With the founding of schools of traditional medicine, more predictable training was provided for these practitioners.

Although the effects of the cultural revolution on quality medical education were devastating, the health policies formulated during the Mao era produced the most extensive public health program ever undertaken in a developing country.[8] It is impressive that with a per capita annual income of only $200 to $255, and two decades of minimal increase in food production,[8] China had significantly improved its healthcare by the time of Mao's death in 1976. Average life expectancy was approaching sixty-five years, and the infant mortality rate had dropped to 40 per 1,000 live births. Four million healthcare givers included 358,520 western doctors, 251,088 traditional doctors, 423,000 graduates of secondary medical schools, 1,600,000 barefoot doctors, 400,000 nurses, and a large number of paramedical personnel (Table).[2]

Redistribution of primary medical care and an emphasis on preventive medicine had greatly improved rural health. Anti-snail, anti-fly, and anti-prostitute campaigns had drastically reduced the incidence of schistosomiasis, malaria, and venereal disease. Leprosy, typhus, tuberculosis, and cholera were controlled. Immunization programs had eliminated smallpox, polio, and diphtheria as major disease threats.[9]

Although the campaign to improve *primary* healthcare for the masses had been highly successful, post-Mao China was to be faced with a serious shortage of *tertiary* medical services in the countryside. Of the 1,856,391 hospital beds in China in 1980 (2 per 1,000 people, as compared with 4.5 per 1,000 in the U.S.), there were only 1.5 per 1,000 in rural China

compared to 3.7 per 1,000 in the cities. The distribution of senior doctors was even more inequitable; 0.3 per 1,000 in the countryside compared to 2.4 per 1,000 in urban areas.[10]

Post-Mao China

In 1980, Mao's successors inaugurated major reforms in economics and medical education. To stimulate agricultural output, financial incentives were offered to the peasants. Land owned by the state was divided into parcels and allocated to families. A production quota for the parcel was assigned to each family. Excess produced beyond the quota could be sold to the government at a bonus price. In one year, per capita agricultural output increased 6 to 8 percent and per capita annual income 10 to 12 percent.[10] The incentive system spurred agricultural output and efficiency but reduced the communal nature of agricultural production, making peasant income less uniform.

A second major economic reform was decentralization of public financing. Before the 1980 initiatives, all revenues were collected by the central government with portions then allocated to local governments.[10] Following decentralization, the central government financed only institutions directly under its control. In health matters, this meant that the central government financed only national hospitals, research institutes, and medical schools. Each province became responsible for its own public services including healthcare, education, and welfare. Prosperous provinces were able to support better health facilities. This accentuated the inequitable distribution of rural health services.

One of the most immediate effects of these economic reforms was a decline in primary healthcare. Under the new agricultural system, many barefoot doctors found it more lucrative to return to farming. Those who remained were reluctant to continue their education and upgrade their skills. More affluent peasants chose to bypass care by less skilled providers in favor of direct treatment in regional clinics. Between 1978 and 1982, the number of barefoot doctors decreased 33 percent.[10]

Another effect of economic reform was the collapse of the cooperative medical insurance system. As agriculture shifted from a communal to a family quota system, premium payments were no longer subsidized or automatically deducted. Attempts to organize voluntary health insurance programs have met with limited success. In a voluntary system, people in poor health are most likely to enroll. Lacking contributions from the young and healthy, premium rates become prohibitive. In 1979, 80 to 90 percent of the rural population had health insurance supplied by an organized cooperative medical system. Within five years, the percent had been halved.[10]

In the decade since the death of Mao, many changes have occurred in Chinese medical education. It appears that effort is being expended to provide personnel with the clinical and research expertise required to cope with China's major new medical problems: cancer, mental illness, and cardiovascular and respiratory disease.[8]

Today, three types of physicians are being educated: practitioners of traditional Chinese medicine, of traditional Mongolian medicine, and of western medicine. Of the 116 medical colleges, eighty-seven are schools of western medicine.[17] Although supervised by the Ministry of Public Health, great latitude in curriculum design is permitted. Traditional medical colleges include western medicine in their programs. In western medical schools, at least 10 percent of the curriculum is devoted to traditional medicine.[4] All medical school curricula include requirements in English and political thought.[11]

Chinese students complete secondary education and apply for medical school at age seventeen. Criteria for admission include scores on national examinations, the quality of the secondary school record, and "proper morality" (political concerns). Although medical school applicants come from the upper part of their graduating class, engineering often attracts the top students because of special incentives offered in an attempt to modernize China's industry.[12]

Provincial or municipal medical colleges accept local students and offer a five or six-year curriculum. The few national medical colleges accept students from all parts of China and are more competitive. (Beijing Medical College recently had 3,000 applications for a class of 200.)[3] Curricula in these institutions extend six to eight years and include opportunities for research and specialization.

Medical students, at least 50 percent of whom are female, are required to live in dormitories provided by the college. Tuition, room, and health insurance costs are paid by the government. A student fee equivalent to about $12 per month is required for board and books.[12]

Upon graduation from western-type medical schools, students receive the degree of Bachelor of Medical Science. On the basis of medical school per-

Table. Healthcare in China

	1949	1979-1980	Mid toLate 1980s

Since complete information is difficult to obtain directly from China, data presented here are obtained from other sources.[1-4,8,10,12,17,18]

*Includes 4 military medical schools

formance and national examinations, graduates will follow one of three paths. Twenty percent of the graduates at each school will be selected for additional training. Of this 20 percent, some will enter a three-year program of course work and research leading to a Master of Medical Science after which they may enter a residency program to become a clinical instructor or continue their graduate work for a doctorate. The rest will enter three years of residency training leading to qualification in a medical specialty. The 80 percent not selected for additional training are assigned by the Ministry of Labor to clinics or small hospitals in the countryside.[12] Competition for additional training is keen!

Personal Observations Following Tiananmen

Apprehensions about how we as Americans might be received in China in October of 1989, so soon after the June 4 massacre at Tiananmen, were soon forgotten. We traveled safely and without restriction. Only in Beijing did we see armed soldiers and even there we were permitted to enter Tiananmen Square and visit the mausoleum of Mao Zedong.

Medical personnel at Guilin People's Hospital (Figure 1), Qi Bao Commune Hospital near Shanghai, Changzhou Women's Hospital, and the Changzhou Hospital of Traditional Chinese Medicine were cordial. Although our tours were brief, the general impression was of old buildings, crowded corridors, and furnishings of 1940 vintage. The one exception was a recently installed CT scanner in Guilin, the gift of a sister city in Japan.

At the Changzhou Women's Hospital, where more than 8,000 babies are delivered each year, we met with the Chief of Obstetrics. The government policy of one family, one child was instituted in 1980. Of the 80 percent of Chinese women who practice contraception, 40.7 percent use an IUD.[13] Dr. Yang estimated that at least twenty abortions are performed by his staff each day. As China's population reaches 1.11 billion, government pressure for strict population control continues.[14]

Dr. Yang reported that in Changzhou no analgesia or anesthesia is used during normal deliveries. A visit to the labor suite revealed six women laboring in total silence; a real tribute to Chinese stoicism! Spinal anesthesia is used for the 22 percent of deliveries accomplished by Cesarean section. Seventy percent of breech deliveries are by Cesarean. At this institution, there was no evidence of fetal monitoring or ultrasonography, although these procedures are used elsewhere in China.[13]

On several occasions we had the opportunity to observe traditional Chinese physicians using acupuncture, moxibustion (Figure 2), and cup suction for treatment of joint and muscle discomfort. Almost all the patients we talked to reported the treatments were beneficial. Our most vivid impression was the total lack of sterile techniques used for the application of acupuncture. Based on western experience, we were concerned about the potential for the spread of hepatitis and AIDS.[15] We inquired frequently about the use of acupuncture for anesthesia. In no institution we visited was acupuncture used as anesthesia for invasive surgery.

Figure 1. Ronald Peterson MD with Chief of Pediatrics (Center) and members of obstetrical staff, Guilin People's Hospital, 1989.

Figure 2. Needles topped with herbs have been inserted into the knee of this patient and will be ignited during moxibustion treatment.

Throughout our trip we wondered about the impact of the recent prodemocracy movement. "How has the student uprising affected your life?" we asked a zoology major on the campus in Nanjing. "As a result of student interrogation by security police, six students and two professors from my school have been dismissed," she responded. "They have been sent to the countryside. Examinations to qualify for graduate school have been cancelled for all of us. Only those with proper politics may apply. I will not be considered."

A first-year medical student showed us the tiny, unheated room she shares with five other students. "What do you plan to do after completing medical school?" we inquired. A long pause, wistful look - "The government will decide where I am needed." These and other private conversations gave us some insight into the insidious nature of the current political system.[16]

Conclusions

In examining the medical and political events of the last forty years in China, it seems clear that the availability and quality of medical care is inexorably tied to the political scene. The China experience offers to the world a model for implementation of a primary healthcare plan capable of increasing life expectancy through reduction of infectious, nutrition-related, and social diseases. Creativity in the development of educational systems for expanding the numbers of healthcare personnel also have wide application. China has proven that a government dedicated to accomplishment of these goals can succeed even when national financial resources are minimal.

Many of the changes taking place in the Chinese healthcare system today are the unintended consequences of economic reform. Reduced primary healthcare, declines in cooperative health insurance, and increased demand for higher-quality medical care offer a challenge to the government. The concept that increased production automatically brings improved healthcare must be viewed with caution. From China, we learn of the potential negative impact economic reform may have on a nation's medical system.

Finally, China has illustrated that political fanaticism in any form may have devastating effects on medicine and medical education. The lessons to be learned from the cultural revolution and the recent suppression of the prodemocracy movement are important.

During the next decade, developments in medical care in China are likely to occur in an atmosphere of considerable tension between those who wish to continue the emphasis on public health issues of the masses, and those who wish to invest in the skills and technology of modern medicine to provide more advanced personal medical care. Similar problems are faced by many nations. The world will be watching for the Chinese solution.

POS Physicians Office System

"With POS, you get the strength and stability of SMS, the leading provider of healthcare information systems, combined with the personalized service that you would expect only from a small company."

In today's demanding and ever changing healthcare environment, you need an information system that will help you meet business challenges and competition head-on.

SMS' Physicians Office System (POS) can give you that edge. POS is a comprehensive medical information system offering all the features required by large clinics, but designed specifically for solo and group medical practices.

- **Advanced Features.** POS capabilities go far beyond billing office functions - they also include extensive management and clinical tools, HMO support, automated appointment scheduling and physicians access to patient information residing in your hospital's system.

- **Backed By The Industry Leader.** POS system software is developed and offered by SMS, the leading provider of healthcare information systems in the U.S. and Europe. With over 20 years of experience and 10,000 physicians as clients nationwide, SMS will be around to support you not only today, but in many years to come.

- **State-Of-The-Art Hardware.** POS runs on state-of-the-art IBM hardware that is easily expandable and adaptable to future requirements. With IBM, you can be sure that your medical information system uses the best and most valued hardware in the marketplace.

But most importantly - POS is delivered with a personal touch. SMS representatives are involved with our clients from the moment they choose our system. We provide continuity by guiding them through both their training and system installation. And we are always available to answer questions and to help them accommodate new regulatory requirements.

Call us today - and learn more about the POS personal touch.

Sigmoid Endometriotic Stricture Treated with Endoscopic Balloon Dilatation: Case Report and Literature Review

Eric S. Miller MD, Robert M. Barnett MD, and Richard B. Williams MD

Dr. Miller is Director, Family Practice Residency OB/GYN Program, Shadyside Hospital, Pittsburgh, PA. Dr. Barnett is Chairman, Department of Obstetrics and Gynecology, Harbor Hospital Center, Baltimore. Dr. Williams is a Gastroenterologist in the Department of Internal Medicine, Division of Gastroenterology, Harbor Hospital Center, Baltimore.

Intestinal endometriosis causing a midsigmoid stricture can be successfully treated by endoscopic balloon dilatation.

Four to 20 percent of menstruating women harbor endometriosis.[1] Of these patients, 12 to 37 percent have involvement of the large intestine and 2 to 7 percent have involvement of the small bowel, usually distal.[2]

Balloon dilatation of gastrointestinal strictures has been successfully applied to the esophagus and, more recently, to the rectosigmoid.[3] The following is a case report of intestinal endometriosis resulting in a stricture of the rectosigmoid, ultimately treated with balloon dilatation. A discussion of intestinal endometriosis follows.

Case Report

A thirty-seven year old woman presented with a one-year history of progressive secondary dysmenorrhea and abdominal pain. The pain was postprandial, worse in the left lower quadrant, and associated with the urge to defecate. There was a decrease in the amount and caliber of her stool but no rectal bleeding was noted, nor was there any association between the abdominal pain and her menses. She had not used contraception since her only pregnancy eleven years previously. She had had no prior surgery, was not taking any medication, and had no allergies.

The physical exam was significant for tenderness and fullness in the left lower quadrant. The bowel sounds were normal. There was no organomegaly, and the pelvic exam was normal. The rectal exam was normal and stool was negative for occult blood.

The abdominal flat plate was normal. A barium study of the colon (Figure 1) demonstrated a persistent short segment of narrowing of the midsigmoid with some mucosal irregularity. An upper gastrointestinal series showed duodenal bulb spasm. A flexible sigmoidoscope was passed to the level of the midrectosigmoid where the lumen narrowed to a pinpoint. At that level, the mucosa was edematous, erythematous, and bled easily. Biopsy revealed chronic nonspecific colitis. Computed tomographic

Figure 1. Barium study of colon demonstrating short segment of midsigmoid narrowing with mucosal irregularity.

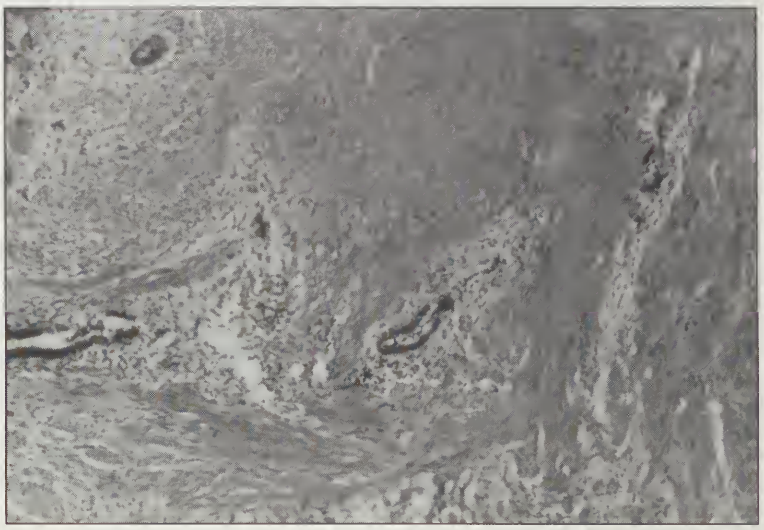

Figure 2. Specimen containing endometrial glands and stroma.

study of the abdomen and pelvis demonstrated retained barium from the previous upper gastrointestinal series in the descending colon. Contrast material introduced per rectum only filled to the distal rectosigmoid region. Bowel wall thickening was noted within this midsigmoid area. There was no extrinsic mass or lymphadenopathy.

Diagnostic laparoscopy showed the right ovary and tube to be bound down in a scarified inflammatory complex. The anterior wall of the sigmoid was densely adherent to the inferior posterior wall of the uterus. The rest of the pelvis and abdomen were normal.

The patient continued to lose weight and remained symptomatic, especially after meals. An exploratory laparotomy was undertaken to relieve the patient's suspected post-inflammatory adhesive disease. No bowel preparation was done. A right salpingo-oophorectomy was performed. Sharp dissection separated the dense adhesion between the distal sigmoid colon and the posterior uterine surface. A frozen section of the portion of the adhesion demonstrated fibromuscular tissue with endometrial-type glands. The wall of the sigmoid colon felt thick and of a rubbery consistency, constricting 80 percent of the sigmoid colonic lumen. A general surgical consultant felt that the stricture was so close to the peritoneal reflection that an attempt to perform an end-to-end anastomosis in an unprepared bowel might result in a colostomy. Pathological evaluation of the resected specimen confirmed endometrial-type glands and stroma (Figure 2).

Postoperatively, danazol, 800 mg a day, was prescribed but was not tolerated well. Persistent symptoms were treated with endoscopic balloon dilatation of the narrowed segment. The pinpoint stricture was noted at 18 cm and a 12 mm through-the-scope balloon dilator was passed and inflated to 50 pounds per square inch for six seconds. Then an 18 mm through-the-scope balloon dilator was passed and inflated to 35 pounds per square inch for six to eight seconds three times. The procedure was tolerated well. Eight months later, repeat sigmoidoscopy was performed easily. The danazol was tapered and stopped. To date (two and one-half years), the patient remains pain free and asymptomatic.

Discussion

Symptoms. Intestinal endometriosis presents in a protean and sometimes unexpected manner. Intestinal symptoms can be vague even with severe involvement; cyclic complaints coincident with the menses are the exception. The most frequent symptoms are diarrhea, constipation, infertility, dysmenorrhea, and lower quadrant abdominal pain, usually left sided (Table 1). In rare cases, the intestinal endometriosis patient presents initially with rectal bleeding, weight loss, or intestinal obstruction. Gross rectal bleeding is present only 20 percent of the time.[2]

Table 1. Summary of Representative Series with Percentage of Patients Presenting with Various Symptoms.

	Teunen[7]	Croom[13]	Forsgren[14]	Williams[9]
Diarrhea, Constipation	61	33	100	
Infertility	33			
Dysmenorrhea	33	47	33	52
Rectal Bleeding	28	6.6		
Cyclic Symptoms	28	40	33	17
Left Lower Quadrant Pain	22			
Menometrorrhagia	17		33	
Right Lower Quadrant Pain	11			
Intestinal Obstruction	6			
Renal Insufficiency	6			
Weight Loss		20		
Unspecified Abdominal Pain		93	67	
Dyspareunia				17

Partial or complete small bowel obstruction occurs in only 1 percent of cases. Nausea, vomiting, diarrhea, constipation, or abdominal pain may coincide with the menses but often do not. Appendiceal involvement is present in 13 percent of cases of pelvic endometriosis.[4] It is usually asymptomatic but can mimic acute appendicitis.

The triad of vague abdominal symptoms, progressive dysmenorrhea, and dyspareunia in a female of low parity should raise the suspicion of intestinal endometriosis.[5]

Physical Exam. The pelvic exam frequently shows an irregular tender fullness which is usually due to extensive adhesions between bowel loops and the pelvis. Palpation of the rectovaginal septum is usually painful and often reveals a mass. Classic uterosacral nodularity is found much less often. Needle aspiration diagnosis of the rectovaginal septum has been successful for pathologic confirmation.[6]

In cases of small bowel involvement, the physical exam is usually negative. Only 25 percent of cases have a nondescript painful right lower quadrant mass.

Screening for occult blood is probably not useful since occult blood has not been found without gross rectal bleeding.[7]

Radiology. A double contrast barium enema test is abnormal in over two-thirds of cases. Multiple abnormalities are associated with endometriosis: circumferential stenosis, rigidity of the bowel wall, extrinsic compression, extramucosal filling defect, and bowel obstruction. Differentiating endometriosis from carcinoma is difficult. The features that favor an extrinsic process such as endometriosis are a long, narrowed segment with smooth, tapered, conical margins rather than the short, abrupt, constricting "napkin-ring" type lesion typical for a neoplasm. Also, neoplasms cause mucosal destruction, whereas endometriosis leaves the mucosa intact (Table 2).

Abnormal radiologic studies may not be helpful in differentiating endometriosis from other diseases of the small bowel. Stenosis of the terminal ileum has been demonstrated, mimicking Crohn's disease. Endometriosis stiffens the serosa causing focal pleating of the mucosa and preventing normal distensibility.[8] These findings suggest an extrinsic disease process that may be detected on a small bowel series. Also, extrinsically affected bowel may be abruptly angulated and fixed.

Table 2. Comparative Features of Carcinoma and Endometriosis[2,13]

	Endometriosis	Carcinoma
Age	25 - 45 Years	40 - 60 years
Sex	Female	65% male
Weight Loss	None, or moderate	Marked
Constipation	Intermittent, Associated with menses	Progressive
Rectal Bleeding	Rare, if present then only with menses	Frequent
Fertility	Low parity	Average parity
Dysmenorrhea	Frequent and progressive	No relationship
Flexible Sigmoidoscopy	Intact mucosa, no bleeding	Gross ulceration with bleeding
Biopsy	Nonspecific	Positive
Barium Enema	Long filling defect, intact mucosa, tapered margins	Short filling defect, irregular mucosa, sharp margins

Anatomy. In patients with intestinal endometriosis, the lesions are distributed as follows: small intestine, 5 to 8 percent; cecum, 3.6 percent; appendix, 3 to 10 percent; rectovaginal septum, 13 percent; and the rectosigmoid, 72 to 95 percent.[9] Small intestinal involvement is usually ileal and involvement of the transverse colon is very rare. Intestinal endometriosis can be present without pelvic endometriosis.

Pathophysiology. The endometriotic implants start off within the serosa. Cyclic engorgement and hemorrhage incite a fibrous reaction and secondary muscular hypertrophy. These lesions progress to cause puckered scarring and eventual nodularity on the antimesenteric border of the bowel. Non-circumferential strictures can occur, and frozen section is often necessary to rule out neoplasm.

Differential Diagnosis. Colonic cancer needs to be ruled out, especially in the perimenopausal woman. Malignant transformation of the endometriotic implant occurs in less than 1 percent of cases,[10] with endometriosis of the rectovaginal septum having three times the rate of malignant transformation as other sites.[6] The true rate of malignant transformation may be higher, as carcinoma in its growth pattern may erase all evidence of having arisen from an endometriotic implant. Endometrial, clear cell, mucinous, and squamous neoplasms have all been reported to arise from endometriosis.

The characteristic features of colonic cancer are a painless mass with intermittent, noncyclic bleeding (Table 2). Other disorders within the differential diagnosis include inflammatory bowel disease, carcinoid tumor, diverticulosis, benign intramural tumors, metastases from an occult intra-abdominal malignancy, pelvic and mesenteric tumors or cysts, and irritable bowel syndrome.

Diagnostic Procedures. Flexible sigmoidoscopy does serve to exclude other diagnoses, particularly malignancy. In intestinal endometriosis, the lesions are extramural with normal overlying colonic mucosa.[11] Despite the normal mucosa, patients with intestinal endometriosis have eccentric compression, bowel wall fixation, and even severe concentric stenosis. The mucosa is more likely to be edematous, hyperemic, or have some mucosal bleeding points when the examination is performed at the time of the menses.

Colonoscopy has been used intraoperatively to clarify unexpected constricting lesions of the large bowel.[12] Endometriosis was suggested by the intact mucosa and extrinsic compression.

Diagnostic laparoscopy can raise the suspicion of intestinal endometriosis when pelvic disease is present.

Treatment. Treatment options include hormonal therapy, resection of the diseased segment, dissection

with release of the obstruction and now, balloon dilatation. Resection of the stenotic lesion is required one-half of the time. Some patients respond to dissection alone with resection of serosal implants.[13,14] Subsequent postoperative studies have demonstrated satisfactory luminal width. Surgical excision has been recommended[7,9,13] when the lumen is narrowed by one-half or more, whether the patient is symptomatic or not. Although minimal complications have been reported where bowel resection was undertaken in the unprepared bowel,[9] it is best to mechanically prepare the bowel in all cases of endometriosis requiring surgery.[15,16] Even resection of serosal implants is safer when the bowel is already prepared. Preoperative consultation between gynecologist and general surgeon is ideal.

Danazol therapy is not expected to be effective as it is unlikely to affect the fibrous tissue within the stenotic segment; yet success with danazol has been described in several case reports.[7] Treatment of small bowel involvement is surgical resection wherever there is gross luminal compromise. Also advised is routine appendectomy and routine evaluation of the distal small bowel, checking for the presence of Meckel's diverticulum which can harbor a focus of endometriosis.

Pathology. Pathologic findings are typical for endometriosis. Glands and stroma can be found in the serosal, muscular, and submucosal layers of the bowel wall, leaving the mucosa free of involvement. Often there is a prominent fibrous reaction.

DESIGNERS, MAKERS, and MERCHANTS OF PRECIOUS JEWELS and the famous CHESAPEAKE BAY COLLECTION

From our collection of remarkable diamond rings in many shapes and sizes.

Through three generations, our philosophy has remained the same: to provide excellent work and traditional personal service — the finest possible value at the lowest possible cost.

Conclusion

Intestinal endometriosis is not uncommon in menstruating women with endometriosis; it has even been reported in postmenopausal women.[17] The presentation often mimics other disease processes such as malignancy and appendicitis. Radiologic studies may help to suggest the presence of endometriosis. Surgical resection of the compromised bowel segment is usually necessary but may be avoided by the institution of balloon dilatation. Presented here is the first case of balloon dilatation performed for a rectosigmoid stricture secondary to intestinal endometriosis.

The statement of McGuff in 1948 is as true now as it was then: "The frequency with which the diagnosis of endometriosis is made by the clinician, the surgeon, or the pathologist varies with their threshold of suspicion and in many cases passes unrecognized."[17]

Amebic Liver Abscess: Review of Twenty-nine Cases with an Evaluation of Imaging Techniques

James J. McCort MD

Dr. McCort is Chairman of the Department of Radiology, Santa Clara Valley Medical Center, San Jose, CA.

On April 16, 1988, a Scientific Program was held at the University of Maryland Medical School and Hospital to honor John Murray Dennis MD on his retirement as Dean of the School of Medicine. This paper was part of an address presented on that date and is a fitting tribute to the long and illustrious career of a man who had such an impact on the field of radiology and on medicine in Maryland.

In amebic liver abscess, prompt diagnosis reduces morbidity and mortality. The use of specific imaging modalities markedly shortens the time required for diagnosis.

An estimated 480 million people or about 12 percent of the world population are infected with entamoeba histolytica.[1] Although the majority of these patients (80-99 percent) are totally asymptomatic, amebiasis causes an estimated 75,000 deaths per year and ranks third, behind malaria and schistosomiasis, as the cause of death by parasitic disease.

The cysts of entamoeba histolytica gain entry to the human intestinal tract in fecal-contaminated water or food. In the intestinal tract, the ameba may exist for long periods without causing symptoms.[2] In time, excystation releases eight trophozoites from each cyst. By adhering to the intestinal mucosa, the trophozoites release enzymes or toxic products to disrupt the intestinal barrier.[3] Hematogenous transport of the trophozoites to the liver via the portal vein follows. Trophozoites destroy the liver cells resulting in an amebic abscess. Only about 4 percent of patients with intestinal amebiasis develop liver abscess.[4] Rarely, abscesses develop in the lung, brain, or spleen.[5] Within the United States, patients in mental institutions, homosexual men, Indochinese refugees, Central American natives, migrant workers, travelers, immigrants, and immunosuppressed individuals show a higher incidence of amebic abscess.[6,7]

The detection of ameba in the stool or from aspirated pus requires technical skill.[4] Entamoeba histolytica must be differentiated from entamoeba coli and other nonpathogenic intestinal ameba. Heyneman detected cysts or trophozoites in the stool in only 12 percent of patients with liver abscess.[4] With extra-intestinal amebiasis, the indirect hemagglutination test (IHA) has greater reliability. An IHA titre greater than 1:64 is considered

positive.[8] It occurs in 87 to 100 percent of patients with liver abscess.[8] The titre falls progressively following successful treatment.

Material and Methods

In a twelve year period from 1976 to 1988, 29 patients with amebic hepatic abscess were admitted and treated at the Santa Clara Valley Medical Center. Retrospective analysis of the clinical presentations, methods of diagnosis, and results of treatment form the basis of this report. The average age of the patients was thirty-four with a range of seven to sixty-five years. A marked preponderance of males was encountered with a male to female ratio of 27:2.

None of the patients were native born and the majority were recent immigrants from an endemic area. Twenty-one came from Mexico, six from Southeast Asia, one from India, and one from the Philippines.

The abscess or abscesses involved only the right lobe in twenty-three patients. The abscesses developed in the left lobe in four patients and in both lobes in two patients.

Findings

Most patients showed signs of sepsis. In twenty-three, the main complaints were fever and chills. Twenty-one patients had abdominal pain and in eighteen this was localized to the right upper quadrant. Seven patients reported nausea and vomiting. Seven had diarrhea and in one patient it was bloody. Five patients, all of whom had a right lobe abscess adjacent to the diaphragm, had right chest and shoulder pain.

Imaging study showed the liver abscess in all patients. Ultrasonographic examination of twenty-eight patients was positive in twenty-six - a sensitivity of 93 percent (Figure 1).

Computed tomography (CT) demonstrated the abscess in all fourteen patients in which it was employed (Figure 2). Liver abscess was shown by nuclear medicine scan in four patients and by total body opacification with conventional tomography in three patients.

Needle aspiration of the abscess was carried out in nine patients. Typical brownish pus was aspirated in eight. The pathologist identified trophozoites in only two of the specimens.

Stools were examined for ova and parasites in twenty-five patients, and in only five (20 percent) were the cysts of entamoeba histolytica found. Other parasites incidentally recovered (each in a single patient) were Ascaris, Giardia, and hookworm.

The indirect hemagglutination test was performed in twenty-five patients. Twenty-four showed a positive titre which ranged from 1:128 to 1:4046.

A right pleural effusion developed in nine patients (31 percent), three of whom had a right lung infiltrate. A right lobe abscess was present in these patients and, presumably, the infection spread via lymphatics to the pleura and lung.

All patients were treated with metronidazole (Flagyl) 750 mg t.i.d. for ten days. In thirteen patients, this was supplemented by diiodohydroxyquin (iodoquinol) 650 mg t.i.d. for twenty days to eliminate ameba from the intestinal tract. All patients responded promptly, becoming afebrile and largely asymptomatic within three days; all recovered.

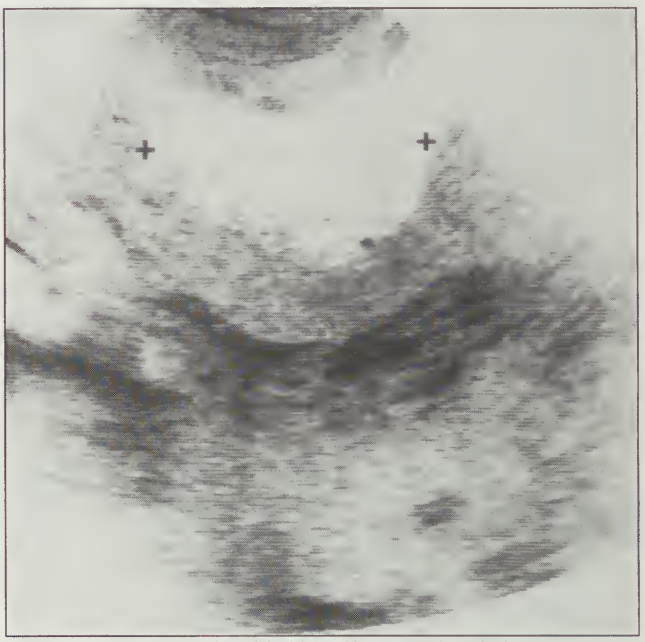

Figure 1. Amebic Liver Abscess - Left Lobe
Ultrasound demonstration. This patient complained of night sweats, a ten-pound weight loss and left upper quadrant pain. On liver ultrasonography, an 8 x 10 cm oval hypoechoic lesion is present in the left lobe (+-+). The abscess shows a poorly defined margin and irregular internal echoes, characteristic of an early stage.

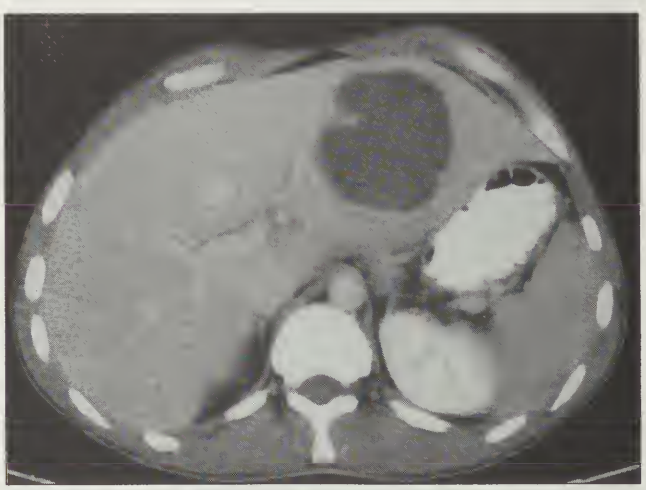

Figure 2. Contrast-enhanced computed tomographic examination of same patient. The oval low density abscess with irregular margins fills the left lobe. Mild enhancement of the rim indicates hyperemia. Indirect hemagglutination titre for amebiasis was 1:2048. With metronidazole treatment, the patient's symptoms regressed rapidly and he was discharged on the third hospital day.

Discussion

In amebic liver abscess, prompt diagnosis reduces morbidity and mortality. The use of specific imaging modalities markedly shortens the time required for diagnosis. Useful imaging techniques include nuclear medicine scan, total body opacification with tomography, cholescintigraphy, arteriography, ultrasonography, computed tomography, and magnetic resonance imaging (MRI). All of these techniques effectively demonstrate liver abscess.

Nuclear medicine scan using intravenously administered technetium 99m sulfur colloid was used initially.[9] The isotope is taken up by the reticuloendothelial system of the liver and spleen, and the abscess appears as a photopenic defect.[8] Gallium citrate scan has also been employed.[10] Nuclear medicine scanning requires a ready supply of the isotope and specialized equipment; it does not permit differentiation of an abscess from liver cyst or avascular tumor.

With technetium 99m dimethyl iminodiacetic acid (t. 99m HIDA), cholescintigraphy shows rim enhancement of hepatic amebic abscess.[11,12] This examination gives limited anatomic resolution.

Total body opacification with complex motion tomography requires a large intravenous contrast infusion.[9,13] An iodine allergy or concurrent renal disease contraindicate the examination. This technique shows only large abscesses.

Arteriography has had limited use in the study of liver abscess. Both amebic and pyogenic abscesses appear as an avascular area with a hyperemic rim. Injection of contrast is required, as is specialized equipment.

In recent years, ultrasonography has received wide use.[14-17] Ultrasound has the advantage of low cost, high sensitivity, the use of non-ionizing radiation, portability of equipment allowing the examination to be performed at the bedside, and prompt availability of results. At times, intestinal ileus may limit the examination and it is operator-dependent. Ultrasound does not distinguish between pyogenic and amebic abscess.[14,16]

Using ultrasonography, Berry et al followed the healing of an amebic liver abscess in eighteen patients.[14] At two to three weeks, the abscess had an echo-poor wall with heterogenous internal echoes. At eight to sixteen weeks, the abscess showed a thick echogenic wall. Complete healing occurred in three to six months.

CT was performed in fourteen patients and was positive in all (Figure 2). CT accurately differentiates a fluid-filled structure from a solid liver tumor. Its drawbacks are its greater expense and the use of ionizing radiation. CT can confirm the ultrasonographic findings and is most useful in detecting extrahepatic spread.[18]

MRI was not used in this series. T1 weighted images show the abscess as a heterogeneous low signal mass devoid of liver tissue.[19] The examination is lengthy and expensive. Rawls et al found no difference in the ability of MRI, ultrasound, or CT to demonstrate an amebic liver abscess.[20]

Abscess aspiration and drainage were carried out in nine patients. One aspiration was dry; eight yielded characteristic thick, brownish pus. From only two were the trophozoites recovered, the remaining six were sterile. Abscess aspiration and/or catheter drainages were found by Giorgio et al to reduce hospitalization and shorten the time required for abscess regression.[21] Since the symptoms of amebic hepatic abscesses respond rapidly to specific treatment, the need for percutaneous drainage has been questioned.[22] With treatment, the abscess will regress slowly over a period of three to six months.[14] Needle aspiration carries with it the hazard of superinfection or hemorrhage, although these complications are rare.[21]

Aspiration appears indicated when the diagnosis cannot be established by other means. Drainage would be needed when studies suggest present or impending perforation of the diaphragm, vena cava, or pericardium.[22]

After the abscess has been detected, the rapid deference of fever and relief of abdominal pain that follow a therapeutic trial of metronidazole help to establish the etiology. Clinical recovery may occur before serology studies are completed.

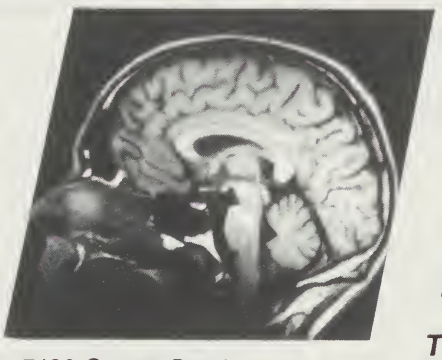
In this study, stool examination for encysted forms and trophozoites was positive in only five patients. This examination is time-consuming and requires an experienced technician. The indirect hemagglutination test (IHA) was positive in all but one patient and confirmed the diagnosis in patients whose stool examination was negative. Because it must be performed by a specialized laboratory, the results of the IHA examination may be delayed several days.

The most common and most dangerous extension of right lobe abscess is to the right diaphragm, pleura, and lung. In a study of 501 patients, Ibarra-Perez found that in 326, the abscess had ruptured through the diaphragm and this group of patients experienced a mortality of 11.4 percent.[23]

Summary

Twenty-nine patients with amebic liver abscess were reviewed retrospectively. In twenty-six of twenty-eight patients, ultrasonography demonstrated the abscess. An elevated indirect hemagglutination titre confirmed the diagnosis in twenty-seven of twenty-eight patients. All patients recovered with specific chemotherapy.

In evaluating clinically suspected amebic liver abscess, ultrasonography is a cost-effective, readily available, and reliable imaging method. If needed, computed tomography provides confirmation. Needle aspiration or catheter drainage have questionable value unless the diagnosis is in doubt or extrahepatic spread is present. The indirect hemagglutination test shows an elevated titre in most patients with liver infestation. By inducing a prompt recovery, antiamebic chemotherapy can confirm a suspected clinical diagnosis.



ADVANCED MRI DIAGNOSTICS FOR THE BALTIMORE-WASHINGTON CORRIDOR MEDICAL COMMUNITY

The Maryland Diagnostic Imaging Center provides magnetic resonance imaging (MRI), offering clinicians access to anatomical and biochemical information often unavailable through older diagnostic methods.

MRI is non-invasive and does not require radiation, but uses magnetism, radio waves and computers to produce images with unparalleled anatomical information. MRI scans involve no known risk.

The Maryland Diagnostic Imaging Center is conveniently located on the campus of the Greater Laurel-Beltsville Hospital, one-half mile east of Interstate 95.

MARYLAND DIAGNOSTIC IMAGING CENTER

- *Excellent suburban location;*
- *A radiologist is available for professional consultation;*
- *Immediate reports;*
- *A FAX is on site for scheduling or processing reports;*
- *We hand deliver duplicate films to your office.*
- *Evening hours available.*

Most Maryland area insurers cover MRI.

7120 Contee Road
Laurel, Maryland 20707

John Archer: First Medical Graduate of the New World

William H.M. Finney MD, FACS, MPH

Dr. Finney is a consultant to the General Accounting Office on Congressional Health Planning.

John Archer was the first person to receive a medical degree in the western hemisphere and was one of the founders of the Medical and Chirurgical Faculty of Maryland.

"...there shall never be lacking a succession of intelligent and skilled physicians who in their concern for health of mankind will have been a great credit to themselves and their country."[1]

These were the closing words of John Lawrence, valedictorian of the first graduating class from a medical school in America, June 21, 1768.[2]

John Archer (Figure 1), being alphabetically first in this pioneer class of ten, was the first to receive a medical degree in the western hemisphere. He went on to distinguish himself in the field of medicine and in service to this nation yet to be born.

Dr. Archer, born May 5, 1741 in Churchville, Harford County, Maryland, was educated at the local Nottingham Academy and Princeton University. He received his AB in 1760 and his AM in 1763. He then entered Princeton Theological Seminary to pursue a career in the Presbyterian ministry. However, his performance at his trial sermon for ordination was so poorly received that he abandoned this calling.[3]

Shortly thereafter, he apprenticed himself to Dr. John Morgan in Philadelphia; Dr. Morgan was a prominent physician who had been educated in Edinburgh. At that time, the first formal class in medicine was being formed at the Philadelphia College of Medicine. Archer enrolled at Dr. Morgan's urging.[4]

During the ensuing three years, the new student is said to have displayed extraordinary clinical judgment but only average academic performance. During the summer months, he supplemented his income by serving as a locum tenens physician in nearby New Castle, Delaware. Upon graduation (Figure 2), he declined Dr. Morgan's offer of a partnership and returned to his native Harford County. Here he practiced for the next forty years except for two significant interruptions - the Revolutionary War and his service in the United States Congress.

The founding of the Medical School in 1765 had been for-

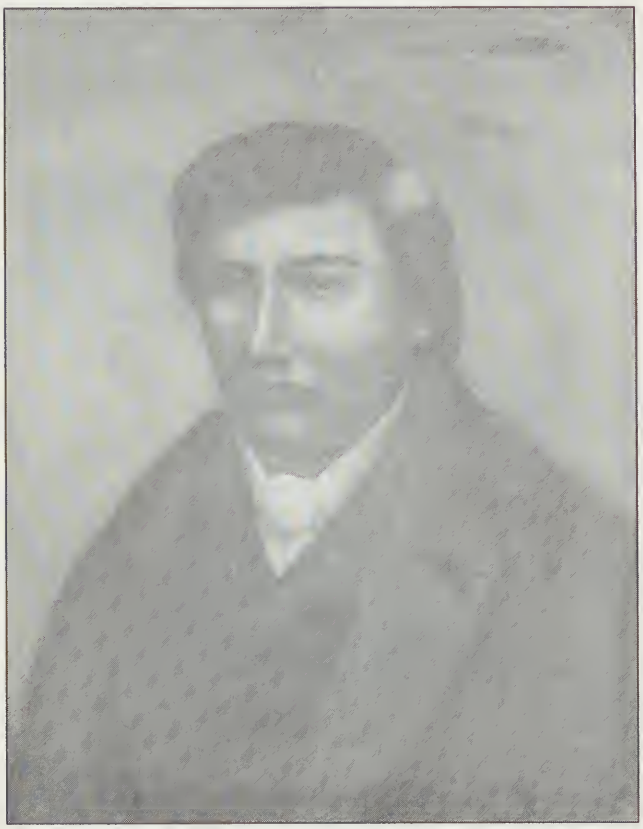

Figure 1. Dr. Archer's portrait hangs in the lobby of the Med Chi building.

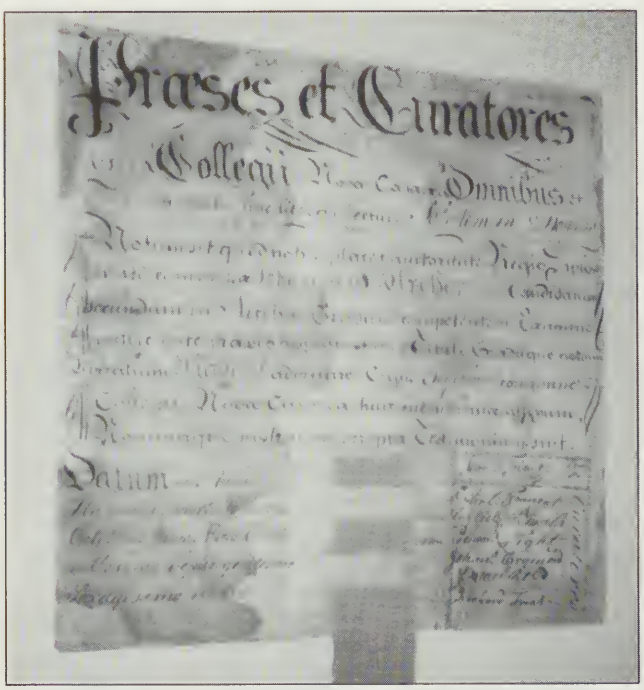

Figure 2. Dr. Archer's Diploma from the Philadelphia College of Medicine

tuitous for John Archer. Although the Stamp Act crisis created great disruption, its repeal in 1769 allowed for a rather misleading period of calm during the 1770s which fostered success for the young physician. By the time the war broke out, Archer and his classmates were seasoned clinicians. His graduating class, being sympathetic toward the revolutionary cause, formed the foundation of the Medical Corps of the Revolutionary Army. Three of the "ten men of '68" did not survive the conflict. Archer distinguished himself.

While in the military service, he attained the rank of Major and was commended by General Washington "for his outstanding surgical skill and compassion." Upon his mustering out of the army in 1779, General Washington again noted Major Archer's "zeal, activity and spirit which are conspicuous on every occasion."[5]

During his years in the military, Dr. Archer also served as a member of the Maryland Convention which framed the Maryland Constitution and the Bill of Rights.

In 1779, Archer returned to his home to resume his practice. He also began active teaching of young doctoral candidates in preceptorships. There were six to twelve students in residence at his home for the next fifteen years. At that time, a preceptorship was still an accepted course of education, in contrast to formal medical school. It was during these years that his home and four hundred and fifty acre estate became known as Medical Hall (Figure 3). On many occasions, the students were visited by guest lecturers: Dr. John Morgan, Archer's mentor; Dr. Benjamin Rush, Dr. Archer's classmate from his Princeton days; and on one occasion, Benjamin Franklin, who recounted his reflections on the French medical system.[6]

Five of Archer's six sons went on to the newly founded University of Pennsylvania Medical School, which took over the Medical College of Philadelphia in 1789. The sixth son became a Supreme Court Judge.

Subsequently, the Medical Hall Alumni organized a medical society before which they presented original papers. In 1799, Dr. Archer joined with these colleagues to found the Medical and Chirurgical Faculty of the State of Maryland.[7]

The management of difficult obstetrical problems and childhood croup brought great credit to Dr. Archer throughout the middle Atlantic States. On numerous occasions he was called from the floor of Congress to consult on difficult deliveries by prominent Washingtonians. During the winter months, he frequently hurried from the Capitol to attend a croupy child. One of his papers, published in the *Medical Repository of New York,* introduced Seneka Snakeroot as a decongestant for croup. The present synthetic base for one of the modern day decongestants is chemically similar to Seneka. Dr. Archer advised that "a steaming kettle of water be kept on the

stove, the humid vapors being an adjuvant to the Snakeroot." This, of course, is the forerunner of today's humidifier.[8]

Smallpox was a recurrent threat to those owning slaves. Vaccination, of course, had been known since 1798 and was widely practiced in the New World during the colonial period. Dr. Archer was probably a leader in promoting vaccination of slaves, not only as wise medical practice, but as an important economic protection. As a result of his work, it was thought that the vaccination program for slaves was economically more efficient than for the gentry.[9]

It is said that Archer's interest in obstetrics began when he attended what was perhaps the first recorded birth of Siamese twins in America. He describes it in a letter to his wife from Philadelphia in February 1767, while still a medical student: "...a monster in the shape of two negro children in one. They have two heads, four arms and four legs, distinctly formed; they are united from the shoulders to a little below the navels, and lie in each other's arms, and each having its arm under the other's head. This is a wonder of nature." The correspondence goes on to say, "...it was executed."[4,10] Whether or not euthanasic practices were common to the times is not known. Euthanasia is not a subject easily or frequently discussed in the literature, particularly in colonial puritanical writings.

The American Philosophical Society, a brain child of Benjamin Franklin, was founded in 1743 but floundered because of the disunity of the colonies.[6] It was revitalized in 1768 as the "American Philosophical Society Held at Philadelphia for Promoting Useful Knowledge." This became a successful and respected forum for new medical thought. Six of Archer's classmates were elected to membership over the ensuing years; Archer was not, despite the fact that he presented a paper there entitled "Dissertation on an Amphibious Animal Discovered in Baltimore County," accompanied by a stuffed skin of that animal. It is proffered that he was blackballed by Dr. Morgan for declining his offer of partnership several years before.

In 1802, Dr. Archer resumed his practice, following his return to Churchville from his service in the Congress. At times he attended patients at such a distance from home (Figure 4) that when a stranger inquired of Mrs. Archer if Dr. Archer lived there, she replied, "He has his laundry done here."[4]

In 1808, a stroke and rheumatism curtailed his practice. In September of 1810, a second stroke led to his death at home on September 28 (Figure 5). He was 69 years old; a long life for those days.

Many testimonials were forthcoming from the early States. A Dr. Mitchell of New York wrote: "He left the world full of years and honors. His life was fully devoted to the service of his fellow-creatures and to the glory of the great Redeemer."[3]

At his death, Dr. Archer bequeathed his estate to his five physician sons, granted freedom to his slaves, and left a prophecy that abolition of slavery would soon come to be, despite his inward realization that the southern economy was dependent on it.

John Archer's legacy can be measured in many ways; as a physician, militiaman, teacher, humanitarian, gentleman-farmer, statesman, and the patriarch of the New World physicians.[10]

THE MRI CENTER AT MARYLAND GENERAL HOSPITAL
A NEW RESOURCE FOR MARYLAND PHYSICIANS

Maryland General Hospital has installed a Picker Vista MRI 1.0 Telsa Scanner. This system permits high resolution, thin slice imaging capability and small fields of view, all with superior image quality.

Our System and services offer many benefits to area physicians...

- Convenient patient appointments.
- A dictaphone voice retrieval system which allows instant access to dictated MRI reports from any telephone including home, office or even car phones.
- A large magnet gantry and table to accommodate large or obese, and claustrophobic patients up to 300 lbs.
- Twenty-four hour or less report turn around.
- A financial counselor to facilitate MRI payments.
- Actual copy of study available to physician upon request.

The MRI Center at Maryland General Hospital
827 Linden Avenue Baltimore, Maryland 21201
301-225-8121

CHOICE

Medical Mutual Says They Offer It

Princeton Says They Offer It

And PIE Mutual Says They Offer It.

Of course they do. But depending upon *your* needs, the nature of *your* practice and all of those other intangibles that separate you from other physicians, don't you deserve the very *best* choice?

Of course you do. That's why it makes sense to deal with an Agent/Broker who puts *your* best interests first—someone who can place you in *any* of the three companies mentioned above.

If you are sincerely interested in making the best possible choice, don't you think the best possible place to start is by asking which Agent/Broker is best for you?

William C. Garrett & Associates, Inc.

Serving The Insurance Needs Of Maryland Physicians For Over 22 Years.

40 West Chesapeake Avenue, Suite 415
Towson, Maryland 21204
(301) 337-5057
Toll Free: 1-800-458-7295

MEDICAL MALPRACTICE DAZE

The Value of a Broker

Problem: A physician insured becomes disabled. Two months later, upon learning he cannot return to practice, he requests cancellation and a refund of premium backdated to the date of disability. His insurance company will only cancel as of the date of his written request.

Solution: William C. Garrett represents his client's interest and the insurer establishes a new rule applicable to the physician and all future cases which provides a 90-day grace period for such notifications.

Problem: Three surgeons in a group practice face a major rate increase *plus* proportionately higher premiums which reflect the liability of a fourth partner who had recently retired.

Solution: William C. Garrett recommends a professional reorganization so the three surgeons can take advantage of their insurance company's "cancellation/buy-out" provision and start over with a first year rate a month *before* new rates go into effect. The end result—a projected $200,000 savings over a three-year period.

Learn why physicians across Maryland have been depending upon William C. Garrett for over 20 years. It pays to deal with a specialist who represents carefully chosen medical malpractice carriers! Write or call:

Council - September 14, 1990
385th Meeting

Committee on Professional Ethics - The Council reviewed and discussed the recommendation from the Professional Ethics Committee that Med Chi adopt a position regarding euthanasia. After extensive discussion, it was moved and adopted that the following be the policy statement on the issue of euthanasia:

> EUTHANASIA IS DERIVED FROM THE GREEK MEANING "GOOD" OR "EASY DEATH." EUTHANASIA IS THE ACT OR PRACTICE OF CAUSING THE DEATH OF PERSONS WHO ARE HOPELESSLY SICK OR INJURED, FOR REASONS OF MERCY. THE POSITION OF THE MEDICAL PROFESSION IS DERIVED FROM THE HIPPOCRATIC TRADITION WHICH PROHIBITS A PHYSICIAN FROM GIVING A DEADLY POTION TO A PATIENT, EVEN THOUGH ASKED TO DO SO. THE INTENTIONAL TERMINATION OF THE LIFE OF ONE HUMAN BEING BY ANOTHER IS CONTRARY TO MEDICAL TRADITION.
>
> THERE ARE SITUATIONS IN WHICH A PHYSICIAN MAY PERMIT A TERMINALLY ILL OR IRREVERSIBLY COMATOSE PATIENT TO DIE BY NOT INITIATING OR CONTINUING TREATMENT THAT PROLONGS THE DYING PROCESS. THIS SHOULD NOT BE TERMED EUTHANASIA.
>
> LIKEWISE, THE ADMINISTRATION OF A DRUG NECESSARY TO EASE THE PAIN OF A PATIENT WHO IS TERMINALLY ILL AND SUFFERING EXCRUCIATING PAIN MAY BE APPROPRIATE MEDICAL TREATMENT EVEN THOUGH THE EFFECT OF THE DRUG MAY SHORTEN LIFE.

Conjoint Task Force on Managed Care - The Council reviewed and adopted the "Guidelines for Appropriate Treatment and Transfer of Managed Care Plan (MCP) Subscribers" as follows:

1. The patient is ultimately responsible and indebted for any non-covered medical service rendered.
2. Most MCPs offer a type of indemnification for medical care requested outside the usual structure of the MCP. This is usually arranged prior to the request for such service. In cases where the gravity or seriousness of the situation demands immediate treatment, retrospective evaluation of the circumstances shall be the means to determine if such indemnification will take place.
3. The medical record is necessary for the efficient and timely evaluation of claims for compensation. The provider/facility shall provide a copy of the medical record along with the claim to the MCP.
4. It is in fairness to the MCP as well as the provider that a good faith effort be made to adjudicate a completed claim, accomplished by the medical record, within 90 days of receipt. There will be a good faith effort by the provider to submit completed claims within 90 days of the date of service.

Following the adoption of the committee's first recommendation, the Council approved the second recommendation which was to disband this task force with the full appreciation of the Council for a job well done.

Legislative Ad Hoc Committee - The Committee presented its resolution to the Council for discussion and approval:

> It is the recommendation of the Ad Hoc Committee on automobile no-fault insurance that Med Chi actively participate in the coalition to fight the implementation of a fee schedule for auto accident cases and that Med Chi's participation in this coalition be very narrowly directed to this issue alone. (The foregoing resolution was modified by Council action and is not the original submission of the committee.)

The Baltimore County Medical Association submitted the following resolution for consideration:

> *Resolved*, that the Medical and Chirurgical Faculty of Maryland through an Ad Hoc Committee consisting of the chairman or his or her designee from the Ethics, Legislative, Patient/Physician Relations, Peer Review, and Peer Review Management Committees, study the issue of no-fault insurance and the alleged abuses and report back to the Council by December 1990.

The following was submitted by the Baltimore City Medical Society as a substitute resolution:

> Inasmuch as physicians have no expertise in the area of automobile insurance, the Medical and Chirurgical Faculty has no position on the basic issue of no-fault auto insurance. Such a position does not preclude the Faculty from taking action on issues related to no-fault auto insurance such as medical definitions or physician fees which directly affect the practice of medicine. Therefore, the Legislative Committee is directed to keep abreast of any no-fault automobile legislation introduced and to make appropriate recommendations to the Executive Committee on issues in such legislation which affect the practice of medicine.

The Baltimore City Medical Society's substitute resolution was adopted in lieu of the Baltimore County Medical Association's resolution.

After further discussion, it was moved and adopted to refer the entire issue back to the Executive Committee for further deliberation and for the Executive Committee to report back to the Council at a later date.

PRO Monitoring Committee - The Council approved the following PRO Monitoring motion:

- The Council will continue to oppose office-based physician reviews.
- The Council will request that the Delmarva Foundation for Medical Care, Inc. expand its Board of Directors to allow physician representatives from all regions of the State. (Presently the board members represent only the Eastern Shore and District of Columbia with no representatives from any other regional areas.)
- The Council approved that the Faculty will distribute information concerning the sanction process to all component and specialty societies.

Liaison with the Medical Assistance Program - The Department of Health and Mental Hygiene has developed the Medical Assistance Open Enrollment Program to provide needed care to their beneficiaries. The Executive Committee reviewed and approved the distribution of the joint signature letter and explanation of the four page summary sheet, enclosed for the Council's review.

Medicolegal Committee - The Council reviewed and

approved for informational purposes the report on "Living Will and Durable Power of Attorney."

Committee on Public Health - The Council approved the recommendation that the Faculty adopt the AMA's position on preparticipation athletic examinations.

1. The development of consistent standards among schools for preparticipation athletic examinations.
2. Only licensed physicians perform preparticipation examinations.
3. The decision of whether or not an adolescent is healthy and physically mature enough to participate in a sport be made by a licensed physician.
4. The decision of when an injured adolescent resumes athletic participation be made by a licensed physician.
5. The guidelines established by the American Academy of Pediatrics, and included as an appendix to Board of Trustees Report R(A-90), be used to determine eligibility for sports participation.

The Council approved a correction to the wording by deleting the word "qualified" and replacing it with the word "licensed."

Physician Rehabilitation Program - Dr. Stanley Platman reported on the expansion of the Physician Rehabilitation Program. This program will be reviewed by the Finance Committee and implemented within the 1991 budget process. Next year's budget will be presented to the Council as required by the Bylaws.

Emeritus Membership - The following recommendations for Emeritus Membership in the Faculty were approved for submission to the House of Delegates for consideration:

Baltimore City
John M. Dennis MD, Baltimore
Robert A. Hoffenberg MD, Baltimore
Antonio K. Olmedo MD, Towson
Rawdon E. Rambo MD, Baltimore
Henry M. Seidel MD, Columbia

Baltimore County
Paul F. Guerin MD, Baltimore
Edmund Kasaitis MD, Baltimore
Fred N. Sugar MD, Lutherville

Carroll County
William L. Stewart MD, Gainesville, FL

Montgomery County
John S. Harrington MD, Silver Spring
E. Anne D. Mattern MD, Rockville
J. Peter Murphy MD, Bethesda

Wicomico County
William P. Sadler MD, Salisbury
Ollie H. Thompson MD, Salisbury

The follow physicians were approved by the Council for a waiver of dues:

Baltimore City
Joel M. Cherry MD, Baltimore

Baltimore County
Charles Smith Kertay MD, Pikesville

Harford County
Gunther D. Hirsch MD, Havre De Grace

St. Mary's County
G. Josephine Garner MD, Leonardtown

MIEMSS - Council Chairperson, Dr. Schneider reported on the request received from members of MIEMSS to help support the current program and autonomy of the Shock Trauma Center. The Faculty sent a letter to Governor Schaefer in support of retaining the MIEMSS as it is presently constituted.

CLIA 88 Update - Dr. Schneider updated the Council on the status of CLIA 88. A thirty day extension to the August 20, 1990 deadline for receiving comments was obtained from the Health Care Financing Administration (HCFA). The new public hearing closing date on the CLIA 88 regulations was September 21, 1990. All physicians were urged to visit the CLIA 88 exhibit booth area at the Semiannual Meeting and write to HCFA concerning how this program will impact on this partnership.

AMA Annual Meeting Update - Dr. Malouf, Chairman of the AMA Maryland Delegation, briefed the Council on the AMA's Annual meeting. The Delegate's Report was sent to the Council members for their review.

Practice Parameters - The Council adopted the Executive Committee's recommendation on practice parameters which is consistent with the AMA's policy.

> The Faculty supports the use of parameters that meet accepted principles as the foundation for developing and modifying quality assurance programs, to identify medical services which should be approved, and to identify services which require additional review. However, practice parameters should not be used as the only basis for quality, utilization, or payment decisions. In most circumstances, variations from parameters should constitute only a signal for further peer-to-peer consideration.
>
> The Faculty also supports research that will provide a better scientific basis for clinical management decisions. Well-conducted research, incorporated into effective practice parameters, should likewise improve both treatment decisions and quality assurance programs.

Medicare Physician Regulation Relief Amendments - Dr. Schneider updated the Council on Congressman J. Roy Rowland's 'Anti-Hassle' bill, HR 4475. Our Representatives were requested to co-sponsor the bill by calling Congressman Rowland's office at 202-225-6531 and asking for Kathy Hennemuth.

As of the Semiannual meeting, the following Maryland Representatives have signed on as co-sponsors: Roy P. Dyson, Constance P. Morella, Tom McMillen, Beverly B. Byron, Kweisi Mfume, Benjamin L. Cardin, and Helen Bentley. As of this meeting, Steny H. Hoyer is the only Representative who has not signed on as a co-sponsor. ■

Medical and Chirurgical Faculty of Maryland
Semiannual Session, House of Delegates (332nd Meeting)
Saturday, September 15, 1990
Carousel Hotel and Resort Center, Ocean City
Unapproved

The 332nd meeting of the the House of Delegates of the Medical and Chirurgical Faculty was held on Saturday, September 15, 1990 at the Carousel Hotel and Resort Center in Ocean City, MD. Officers present were Reynaldo Lee-Llacer MD, President; Harold B. Bob MD, Secretary; Jose M. Yosuico MD, Treasurer; and Marvin Schneider MD, Chairperson of the Council. (Also present, but not on the podium, were Gary Rosenberg MD, Vice-chairperson; Lawrence H. Fink MD, Treasurer-elect; and J. David Nagel MD, President-elect.)

The following delegates (or alternates) were registered as being in attendance; an asterisk (*) indicates an alternate delegate; (C) denotes Council member.

Allegany County
*Wally S. Hijab MD**

Anne Arundel County
*Cornelia M. Dettmer MD**

Baltimore City
Raymond M. Atkins MD (C)
Albert M. Antlitz MD (C)

Call to Order

The meeting was called to order at 1:10 p.m. by the President, Reynaldo Lee-Llacer MD.

Invocation

The Reverend Dr. John Zellner, Rector, St. Paul By-the-Sea Episcopal Church, Ocean City, delivered the invocation.

Pledge to the Flag

A videotape depicting the dramatic events that took place at the Battle of Fort McHenry as seen by Dr. William Beane, a Maryland physician, was shown and was followed by the Pledge of Allegiance.

Minutes of Previous Meeting

The minutes of the May 9, 1990 Annual Meeting were approved with the following members added to the attendance roster: Albert L. Blumberg MD, Esther Edery MD, John H. Hebb MD, Herman C. Maganzini MD, and Joseph Snyder MD.

Attendees at the Semiannual Meeting in Ocean City gained valuable knowledge while earning CME credits.

Health Care Financing Administration Presentation

Mr. Maurice Hartman, Regional Administrator, Region III, Health Care Financing Administration (HCFA), provided an overview of current HCFA issues of importance to physicians.

Certificates of Appreciation for their assistance in facilitating understanding of physician payment reform were awarded to: Mr. Maurice Hartman; Mr. Dennis Carroll, Chief, Policy and Technical Assistance Branch, HCFA; and Ms. Jean Gray, Physician Payment Reform Coordinator, HCFA.

Media Awards

Winners of the Fifth Annual Media Awards for excellence in medical journalism were announced. They will receive Certificates of Merit.

Daily Newspaper Category: Patrick Gilbert, "Mercy on Wheels," *Evening Sun.*

Non-Daily Newspaper Category: Lynne Salisbury, "One Day at a Time," *The Columbia Flier.*

Magazine and Newspaper Category: Larry Thompson, "The Ultimate Body Shop," *Warfield's.*

Radio and Television Category: John Stupak, "Just for the Health of It," Consultation Radio Network.

Maryland Medical Journal Award

The winner of the fourth annual award for the best article published in the *Maryland Medical Journal* was Gerald A. Glowacki MD for his article, "Estrogen Replacement Therapy: Risk/Benefit Ratio for Treatment," which appeared in the July 1989 issue.

Dr. Glowacki was presented with a plaque for his winning article, copies of which were made available to the membership at the meeting.

Emeritus Membership

On motion of Dr. Marvin Schneider, Council Chairperson, the following members, having received the recommendation of their component societies, were elected to Emeritus Membership:

Baltimore City
John M. Dennis MD, Baltimore
Robert A. Hoffenberg MD, Baltimore
Antonio K. Olmedo MD, Towson
Rawdon E. Rambo MD, Baltimore
Henry M. Seidel MD, Columbia

Baltimore County
Paul F. Guerin MD, Baltimore
Edmund Kasaitis MD, Baltimore
Fred N. Sugar MD, Lutherville

Carroll County
William L. Stewart MD, Gainesville, FL

Montgomery County
John S. Harrington MD, Silver Spring
E. Anne D. Mattern MD, Rockville
J. Peter Murphy MD, Bethesda

Wicomico County
William P. Sadler MD, Salisbury
Ollie H. Thompson MD, Salisbury

Council Chairperson Report

Marvin Schneider MD, Chairperson of the Council, presented an update of subjects discussed at the Coun-

cil meeting on September 14, 1990. Topics included CLIA 88 Laboratory Regulations, the MAC program, a summary of the Maryland Laboratory Regulations, Med Chi's position on euthanasia, the no-fault insurance issue (which was referred back to the Executive Committee), Med Chi's position that the MIEMMS organization should remain autonomous, Med Chi's position on the pre-exams for youth participating in school athletics, the AMA's practice parameter policies, and presentation of the Physician Rehabilitation Program.

Treasurer's Report

Jose M. Yosuico MD, Treasurer, presented the auditor's certification statement for 1989. It was moved and passed that the auditor's report need not be read. The certification of accountants was approved as published in the August 1990 *Maryland Medical Journal.*

1989-1990 Committee Reports

The 1989-1990 committee reports were not presented but accepted as published in the August 1990 *Maryland Medical Journal* since any recommendations or resolutions contained in those reports were reported on at the annual session in May. An opportunity was afforded the membership to raise questions or make comments.

Report of the Delegates to the American Medical Association Albert M. Antlitz MD, Roland T. Smoot MD, Donald T. Lewers MD, George S. Malouf MD, John Hebb MD, and Michael R. Dobridge MD (Interim Meeting, December 3-6, 1989)

Committee on AIDS Donald M. Pachuta MD, Chairperson and John C. Downs MD, Chairperson

Committee on Alcoholism and Chemical Dependency Franklin T. Evans MD, Chairperson

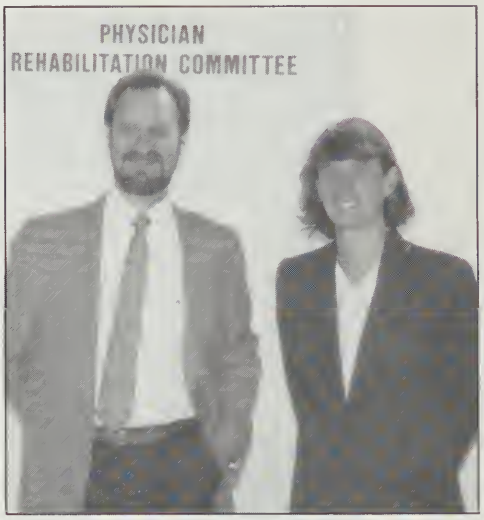
Bylaws Committee Karl H. Weaver MD, Chairperson

Computers in Medicine Committee Rafael C. Haciski MD, Chairperson

Committee on Continuing Medical Education Review Eugene P. Libre MD, Chairperson

Committee on Drugs Nelson G. Goodman MD, Chairperson

Committee on Emergency Medical Services Peter M. Fahrney MD , Chairperson



Finance Committee Jose M. Yosuico MD, Chairperson

Committee on Hospital Medical Staffs Victor R. Hrehorovich MD, Chairperson

Legislative Committee Susan R. Guarnieri MD, Chairperson

Liaison Committee with the Medical Assistance Program Gary R. Rosenberg MD, Chairperson

Library and History Committee Nancy T. Nichols MD, Chairperson

Director of Physician Rehabilitation, Mike Llufrio, and Public Relations Director, Betsy Newman, were on hand at the Med Chi booths to answer inquiries and aid members.

Long-Term Care and Geriatrics George Taler MD, Chairperson

Managed Care and Third-Party Liaison Committee Aristides C. Alevizatos MD, Chairperson

Maryland Medical Journal Victor R. Hrehorovich MD, Editor and Henry P. Laughlin MD, ScD, ScSD, Associate Editor

Med Chi Insurance Fund Albert M. Antilitz MD, Chairperson

Medicine and Religion Committee Leslie R. Miles, Jr. MD, Chairperson

Medicolegal Committee George H. Greenstein MD, Co-chairperson and Augustus F. Brown, VI Esq., Co-Chairperson

Committee on Mental Health Kenneth L. Malinow MD, Chairperson

Music Medicine Clearinghouse Advisory Board Christian S. Mass MD, Acting Chairperson

Occupational Health Committee Michael K. Spodak MD, Chairperson

Peer Review Committee Pablo E. Dibos MD, Chairperson

Peer Review Management Committee Christopher M. Harvey MD, Chairperson and Ronald J. Cohen MD, Vice-chairperson

Physician/Patient Relations Committee Lois E. Wehren MD, Chairperson and B. Martin Middleton MD, Vice-chairperson

Policy and Planning Committee Albert M. Antlitz MD, Chairperson

Committee on Professional Ethics Louis C. Breschi MD, Chairperson

Professional Review Organization Monitoring Committee John A. Singer MD, Chairperson

Public Health Committee Herman C. Maganzini MD, Chairperson

Public Relations Committee William A. Cassidy MD, Chairperson

Committee on Small Area Practice Variation Peter E. Dans MD, Chairperson

Committee on Specialist Identification Joseph I. Berman MD, Chairperson

Specialty Societies Committee Louis C. Breschi MD, Chairperson

Women in Medicine Ad Hoc Committee Margaret T. Snow MD, Chairperson

Commiteee on Young Physicians Susan W. Owens MD, Chairperson

Maryland Foundation for Health Care Election

During this election, three members were to be elected from Baltimore City, two members from Baltimore County, one member from Montgomery County, two members from Prince George's County, one member from the Eastern Shore, and one member from Western Maryland.

Since no nominations were received for Baltimore City, Baltimore County, the Eastern Shore or Western Maryland as of the closing date of August 6, 1990, the Chairperson asked for nominations from the floor:

Baltimore City
Raymond M. Atkins MD, GS
James E. Bell MD, R
Hiroshi Nakazawa MD, GS

Baltimore County
Esther Edery MD, PD
Adam F. P. Szczypinski MD, GP

Eastern Shore
There were no nominations. The position will be filled by action of the Foundation's Board of Directors.

Western Maryland
There were no nominations. The position will be filled by action of the Foundation's Board of Directors.

The Secretary read the following list of nominations:

Montgomery County
James A. Rossi MD, IM

Prince George's County
Suresh G. Gupta MD, IM
Frederick H. Wilhelm MD, FP

There being no contest for any position for which there were nominations, the candidates were declared elected by acclamation.

Bylaws Committee

The President advised the members of the House that the "consent calendar" procedure would be used for the report of the Bylaws Committee. Following a review of the issues of the report by Kevin N. Hennessey MD, Chairperson of the Bylaws Committee, Items 1 through 4 were extracted for discussion.

After discussion, it was decided to adopt the bylaw amendments, Items 1, 2, 3, and 4 with the word "select" changed to "appoint" wherever it appears. Item 1 establishes a Music Medicine Clearinghouse Committee. It was noted that changing this from an ad hoc committee to a standing committee would have no fiscal impact. The membership moved to waive reading of Item 5 and this was seconded and passed.

Dr. Hennessey, on behalf of the Bylaws Committee, moved adoption of the bylaw amendments, **Items 1, 2, 3, 4, and 5** of the report, which were **adopted unanimously** as follows:

1. Proposed Bylaw Amendment to the Ad Hoc Music Medicine Clearinghouse Committee

Rationale: To change the status of the Ad Hoc Music Medicine Clearinghouse Committee to make it a standing committee of the Faculty.

Amend Article XI (Committees), by adding a new Section 40:

> Section 40. A Music Medicine Clearinghouse Committee of at least five members shall be appointed annually by the president to collect, organize, and disseminate information relating to the medical problems of musicians. The goal is to acquire original copies of books, journal articles, and other published materials in all languages, encompassing both traditional medical viewpoints and various alternative therapies. The collection will include items of rare or historical importance as well as archival materials. Clearinghouse information will be stored and organized so that it is available and useful to physicians, other healthcare professionals, musicians, educators, and researchers. Materials will be made available as widely as possible.

2. Proposed Bylaw Amendment to the Committee on Drugs, Article XI, Section 7

Rationale: To establish staggered terms of office for appointed members of the committee.

Amend Article XI (Committees), Section 7, following the words "A Committee on Drugs" and before the words "of at least five members" by inserting the words "shall consist"; and following the words "of at least five members" and before the words "shall be responsible" by inserting the words "who shall serve on a three-year staggered term basis. The president shall select one-third of its members each year for a three-year term. The president will also appoint the chairman. The committee"; and by deleting the words "Its chairman and members shall be appointed annually by the President."

3. Proposed Bylaw Amendment to Physician/Patient Relations Committee, Article XI, Section 25

Rationale: To establish staggered terms of office for appointed members of the committee.

Amend Article XI (Committees), Section 25, following the words "A Physician/Patient Relations Committee"

and before the words "composed of at least nine members" by inserting the words "shall be"; and following the words "of at least nine members" and before "shall hear and determine" by inserting the words "who shall serve on a three-year staggered term basis. The president shall select one-third of its members each year for a three-year term. The president will also appoint the chairman. The committee"; and by deleting the words "The chairman shall be appointed by the President."

4. Proposed Bylaw Amendment to the Peer Review Management Committee, Article XI, Section 24

Rationale: To establish staggered terms of office for appointed members of the committee.

Amend Article XI (Committees), Section 24, following the words "shall consist of not less than nine members" and before the words "and be selected from nominees" by inserting the words "who shall serve on a three-year staggered basis"; and by deleting the words "The chairman and members shall be appointed by the president"; and following the words "Appointments shall be based on the nominees' experience on the medical review committee" and before the words "The Chairman or his designee" by inserting the words "the president shall select one-third of its members each year for a three-year term. The president will also appoint the chairman."

5. Proposed Bylaw Amendment to the House of Delegates, Article VI, Section 2

Rationale: To delete for clarification of language.

Amend Article VI (House of Delegates), Section 2, by deleting the words "of the Council."

(The full Bylaws Committee Report appears on p.1101)

Review of Policy Resolutions

Resolutions adopted in 1985 were reviewed as follows:

Resolution 1A/85 (a) - Filed, NO ACTION

Resolved, That the Medical and Chirurgical Faculty of Maryland strongly recommends to the Maryland Foundation for Health Care that it restudy criteria established in the professional review organization contract, in association with the specialty societies of Maryland, within the next ninety days and revise any and all criteria found to have a potentially adverse effect on the quality of medical care rendered patients in Maryland.

Resolution 1A/85(b) - Filed, NO ACTION

Resolved, That the Medical and Chirurgical Faculty, representing the physicians of Maryland, rejects as arbitrary and inappropriate the Maryland Foundation for Health Care document containing a list of surgical procedures and diagnoses or symptoms for which inpatient hospital care is denied; and be it further...

Resolution 1A/85(c) - REAFFIRMED

Resolved, That the Medical Chirurgical Faculty, concerned that the quality of medical care not be sacrificed in the name of cost containment, urges that any future such restrictive policies be disseminated and implemented only after adequate consultation with appropriate specialty societies and groups.

Resolution 2A/85(a) - REAFFIRMED

Resolved, That a major activity of the Faculty is to promote a positive relationship between the patient and the physician and to that end, be it further...

Resolution 2A/85(b) - REAFFIRMED

Resolved, That the Public Relations Committee be instructed to develop and direct an effort toward improving and maintaining positive relationships between individual patients and their physicians and to coordinate the activities of local medical societies in this endeavor.

Rose Mary H. Bonsack MD Legislative Campaign Fund

Rose Mary H. Bonsack MD, who is running for a legislative seat from Harford County, thanked the members who contributed to her campaign. She said that her campaign funds were depleted and made a plea for campaign contributions to put "a Doctor in the House." Campaign contributions can be sent directly to Med Chi to forward to Dr. Bonsack.

Drug Abuse Seminar

George S. Malouf MD reminded the membership that a drug abuse seminar, sponsored by the Physician Rehabilitation Committee, would be held October 20-21 at the Convention Center and that Med Chi had decided to waive the registration fee. He spoke to the membership about the importance of their attendance at this seminar.

Nominations Reopened

Edward W. Ditto III MD, Washington County, asked that the nominations for the Maryland Foundation for Health Care be reopened. This motion was seconded and passed. He nominated *Charles C. Spencer MD,* IM from Washington County for the vacancy from the Western District. The nomination was seconded and passed by membership. Dr. Spencer will fill the vacancy for Western Maryland on the Maryland Foundation Board.

Adjournment

There being no further business, the meeting was adjourned at 2:45 p.m.

HAROLD B. BOB MD, Secretary ■

Bylaws Committee

The Bylaws Committee recommends the following bylaw amendments to the House of Delegates for its consideration:

1. Proposed Bylaw Amendment to the Ad Hoc Music Medicine Clearinghouse Committee

Rationale: To change the status of the Ad Hoc Music Medicine Clearinghouse Committee to make it a standing committee of the Faculty.

Amend, By Addition, Article XI, Section 40, as follows: [ ] indicates deletion; CAPS indicate change.

SECTION 40. A MUSIC MEDICINE CLEARINGHOUSE COMMITTEE OF AT LEAST FIVE MEMBERS SHALL BE APPOINTED ANNUALLY BY THE PRESIDENT TO COLLECT, ORGANIZE, AND DISSEMINATE INFORMATION RELATING TO THE MEDICAL PROBLEMS OF MUSICIANS. THE GOAL IS TO ACQUIRE ORIGINAL COPIES OF BOOKS, JOURNAL ARTICLES, AND OTHER PUBLISHED MATERIALS IN ALL LANGUAGES, ENCOMPASSING BOTH TRADITIONAL MEDICAL VIEWPOINTS AND VARIOUS ALTERNATIVE THERAPIES. THE COLLECTION WILL INCLUDE ITEMS OF RARE OR HISTORICAL IMPORTANCE AS WELL AS ARCHIVAL MATERIALS. CLEARINGHOUSE INFORMATION WILL BE STORED AND ORGANIZED SO THAT IT IS AVAILABLE AND USEFUL TO PHYSICIANS, OTHER HEALTHCARE PROFESSIONALS, MUSICIANS, EDUCATORS, AND RESEARCHERS. MATERIALS WILL BE MADE AVAILABLE AS WIDELY AS POSSIBLE.

The Bylaws Committee recommends adoption of this proposed amendment.

2. Proposed Bylaw Amendment to the Committee on Drugs, Article XI, Section 7

Rationale: To establish staggered terms of office for appointed members of the committee.

Amend Article XI, Section 7, as follows: [ ] indicates deletion; CAPS indicate change.

Section 7. A Committee on Drugs SHALL CONSIST of at least five members WHO SHALL SERVE ON A THREE-YEAR STAGGERED TERM BASIS. THE PRESIDENT SHALL APPOINT ONE-THIRD OF ITS MEMBERS EACH YEAR FOR A THREE-YEAR TERM. THE PRESIDENT WILL ALSO APPOINT THE CHAIRMAN. THE COMMITTEE shall be responsible for evaluating the appropriateness of prescribing controlled dangerous drugs and shall work closely with appropriate governmental authorities in controlling the abuse of controlled dangerous substances by physicians and be alert to legislative and regulatory proposals regarding prescription drugs, standing ready to provide expertise in this area to such agencies or groups as request it; may provide educational material in the form of lectures and other didactic information on the current knowledge concerning prescribing controlled substances; may provide support and advice to the Department of Health and Mental Hygiene to urge that there are adequate facilities available 24 hours a day to treat all of the victims, both professional and otherwise, of drug abuse and its complications. [Its chairman and members shall be appointed annually by the President.]

The Bylaws Committee recommends adoption of this proposed amendment.

3. Proposed Bylaw Amendment to Physician/Patient Relations Committee, Article XI, Section 25

Rationale: To establish staggered terms of office for appointed members of the committee.

Amend Article XI, Section 25 as shown below: [ ] indicates deletion; CAPS indicate change.

Section 25. A Physician/Patient Relations Committee SHALL BE composed of at least nine members WHO SHALL SERVE ON A THREE YEAR STAGGERED TERM BASIS. THE PRESIDENT SHALL APPOINT ONE-THIRD OF ITS MEMBERS EACH YEAR FOR A THREE-YEAR TERM. THE PRESIDENT WILL ALSO APPOINT THE CHAIRMAN. THE COMMITTEE shall hear and determine all grievances or complaints growing out of the practice of medicine as provided by these bylaws and mediate all problems involving or growing out of the practice of medicine. [The chairman shall be appointed by the President.]

The Bylaws Committee recommends adoption of this proposed amendment.

4. Proposed Bylaw Amendment to the Peer Review Management Committee, Article XI, Section 24

Rationale: To establish staggered terms of office for appointed members of the committee.

Amend Article XI, Section 24, Peer Review Management Committee, as follows: [ ] indicates deletion; CAPS indicate change.

Section 24. A Peer Review Management Committee (PRMC) shall consist of not less than nine members WHO SHALL SERVE ON A THREE-YEAR STAGGERED TERM BASIS and be selected from nominees submitted by component societies. Appointments shall be based on the nominees' experience on the medical review committee. [The chairman and members shall be appointed by the President.] THE PRESIDENT SHALL APPOINT ONE-THIRD OF ITS MEMBERS EACH YEAR FOR A THREE-YEAR TERM. THE PRESIDENT WILL ALSO APPOINT THE CHAIRMAN. The Chairman or his designee may serve in an ex-officio capacity on the Board of Physician Quality Assurance. It shall be the duty of the committee to receive and record cases referred by the Board of Physician Quality Assurance; to identify the guidelines to be used in conducting reviews; refer cases to the appropriate Med Chi committee, component, specialty society or regional committee; to monitor the status of each case; to review reports received from investigating committees to determine adequacy of the review and the report and either transmit the report to the Board of Physician Quality Assurance or return it to the investigating committee with any inadequacies specified. Further, it shall be the duty of this committee to provide educational programs throughout Maryland to emphasize the elements of peer review; to provide organizational assistance to any review committee in Maryland; and to gather, analyze, and report statistical information annually for use by the Board of Physician Quality Assurance, Med Chi, and component societies in evaluating and upgrading the peer review process.

The Bylaws Committee recommends adoption of this proposed amendment.

5. Proposed Bylaw Amendment to the House of Delegates, Article VI, Section 2

Rationale: To delete for clarification of language.

Amend Article VI, Section 2 as shown below: [ ] indicates deletion.

> Section 2. Regular meetings of the House of Delegates shall be held during the annual and semiannual sessions. At the annual session it shall meet on the opening day and at any session it may adjourn to meet from time to time as it may deem necessary, provided that its meetings shall conflict as little as possible with General Meetings. Special sessions may be called by the President [of the Council] and shall be called on the written request of 50 Delegates.

The Bylaws Committee recommends adoption of this proposed bylaw amendment.

This concludes the report of the Bylaws Committee.

In the Matter of Jeffrey H. Schimandle MD Before the Maryland Board of Physician Quality Assurance

Findings of Fact, Conclusions of Law, and Order

On February 27, 1989, Jeffrey H. Schimandle MD (the Respondent), signed a Consent Order with the Board of Physician Quality Assurance (the Board), in which Respondent's registration to practice medicine in a postgraduate training program in the State of Maryland was reinstated subject to certain conditions of probation. On May 23, 1990, the Board charged Respondent with violation of Condition of Probation #3 of the Consent Order. Specifically, Condition #3 provided as follows:

> For a period of one year beginning on the date that this Consent Order is executed, Respondent shall provide random supervised urine samples for forensic screening including meperidine and normeperidine, at a minimum of three times per week.[1] For a period of one year thereafter, Respondent shall provide random supervised urine samples for forensic screening for meperidine and normeperidine at a rate per week to be established by the Board hereafter. During the period of time after this Consent Order is executed, but before Respondent returns to work as a resident physician, Respondent will provide urine samples for screening by contacting the Resource Center by telephone as instructed by Dr. Whitfield. Once Respondent resumes work as a Resident physician, he will provide the minimum of three urine samples per week based upon a protocol to be established by the Board. This protocol will require Respondent to be available by beeper to respond to calls made to him to provide urine samples and will further require that Respondent will provide a urine sample within two hours of the time that Respondent is notified and a request for a urine sample is made. All urine samples will be strictly supervised by a person or persons hereafter named by the Board to serve that function and all urine samples will be submitted to the supervising person or persons without Respondent having any contact with the sample once given.

Respondent signed a House Staff agreement with University Maryland Medical System (UMMS) on July 1, 1989, and returned as a resident. On July 27, 1989, the Board served Respondent with a copy of the protocol for urine sample collection to which the Consent Order referred in Condition #3.

The charging document of May 23, 1990, alleged that Respondent had failed to give urine specimens after December 4, 1989, as was required by the protocol. A hearing on the alleged violation was held before an administrative law judge on July 2 and 3, 1990. Present at the hearing were Debra G. Woodruff, Assistant Attorney General, Administrative Prosecutor and the Respondent, *pro se*. Respondent was advised on his right to be represented by an attorney. On July 18, 1990, the administrative law judge issued a proposed decision, including proposed findings of fact, a proposed conclusion of law, and a recommended disposition. The parties were notified on their right to take exceptions. On August 7, 1990, Respondent filed his exceptions. The State filed no exceptions. The State and Respondent were notified that the Board would hear oral arguments on August 22, 1990 and considered Respondent's exceptions. On August 22, 1990, the Board considered the administrative law judge's proposed decision, Respondent's exceptions and arguments, the State's arguments, and pertinent parts of the transcript. The Board, by a majority vote of those members considering the case, and by a preponderance of the evidence, voted to issue the following final decision.

Summary of Evidence

The State introduced the following exhibits without objection from the Respondent:

State Exhibit 1: Consent Order
State Exhibit 2: Protocol
State Exhibit 3: Charging Document
State Exhibit 4: Affidavit of Service
State Exhibit 5: Mr. Jones' steno book
State Exhibit 6: 41 lab sheets
State Exhibit 7: Dr. Levine's subpoena and Certificate of Service
State Exhibit 8: Dr. Levine's affidavit
State Exhibit 9: Complete record from St. Joseph's Hospital
State Exhibit 10: Complete copy of Respondent's dental records from Dr. Mitcherling
State Exhibit 11: Copy of letter, Debra Sweet, Esquire, to Judith A. Griffith with three receipts for Percocet, Augmentin and Tylox
State Exhibit 12: Subpoena and Percocet prescription written by Dr. Lorentz
State Exhibit 13: Copy of Augmentin prescription (12/2/89) written by Dr. Mitcherling
State Exhibit 14: Copy of Tylox prescription (12/02/89) written by Dr. Mitcherling
State Exhibit 15: Resident evaluation (8/15-11/17/89) by Dr. Kenzora
State Exhibit 16: Resident evaluation (6/23/90) by Dr. Kenzora

The State called LeRoy Jones as a witness.
The Respondent introduced the following exhibits.[2]

Respondent Exhibit 1: Letter, Respondent to Board, June 12, 1990
Respondent Exhibit 2: Letter, Irvin H. Cohen, MD to William Dorrill, August 17, 1989

[1]The Forensic Urine Screen shall include all the drugs on Drug Profile I which includes amphetamines, barbiturates, benzodiazepines, cannabinoids, cocaine, methadone, methaqualone, opiates, phencyclidine, and propoxyphene. In addition, any screen shall screen for meperidine and normeperidine.

[2]Respondent marked two other exhibits for identification purposes, Exhibits 3 and 12 to which the State objected as to their introduction. The State's objection to Respondent Exhibit 12 was sustained since Patsy Walker, who made the statement, was actually present to testify fully on the subject. The State's objection to Respondent Exhibit 3 was sustained since it was only an excerpt of the letter and the entire letter was available to be admitted. The entire letter was therefore substituted without objection as Respondent Exhibit 3. The excerpt was also attached for the benefit of the Board.

Respondent Exhibit 3: Letter, Respondent to Israel H. Weiner MD et al, September 17, 1989
Respondent Exhibit 4: Excerpt from letter to the Board, dated October 30, 1989
Respondent Exhibit 5: Letter, Allen M. Levine MD to Board, June 1, 1990
Respondent Exhibit 6: Flier for Spinal Instrumentation Course, December 4, 1989
Respondent Exhibit 7: Dental records
Respondent Exhibit 8: Note, Respondent's parents, undated
Respondent Exhibit 9: Itinerary
Respondent Exhibit 10: Charge record
Respondent Exhibit 11: Letter, Betsy Tabor to Board, June 5, 1990
Respondent Exhibit 13: Letter, Betsy Tabor to Board, June 26, 1990
Respondent Exhibit 14: Psychosocial assessment
Respondent Exhibit 15: Residential therapeutic discharge summary
Respondent Exhibit 16: Letter, Paul W. Wells to Whom It May Concern, December 19, 1988
Respondent Exhibit 17: Psychiatric evaluation

The following witnesses were called by Respondent: Respondent; Margaret Weigel, Respondent's co-worker; Patsy Walker, an employee in the Drug Treatment Center of UMMS; and Mrs. Schimandle, Respondent's wife.

Findings of Fact

Based on the testimony and exhibits the Board finds, by a preponderance of the evidence, that:

1. At all times relevant hereto, Respondent was required to comply with the conditions of probation as set forth in the Consent Order of February 27, 1989 (Consent Order).

2. Condition #3 of the Consent Order required Respondent to comply with the Board's protocol for urine screening after Respondent returned to his residency program at UMMS.

3. Respondent returned to his residency program at UMMS on July 1, 1989, and was served with the Board's protocol on July 27, 1989.

4. Condition #3 of the Consent Order and the protocol required Respondent to respond to calls to provide urine samples within two hours.

5. Condition #8 of the Consent Order provided that Respondent could be excused from obligatory urine specimens for a limited time when he was traveling outside Baltimore for reasons related to work, employment, future employment, or family matters if Respondent obtained permission in writing in advance of the time of travel from his psychotherapist and obligatory testing was resumed as soon as the travel time ended.

6. Respondent did not see a therapist after August 17, 1989, after Respondent's therapist wrote to the Board stating that he saw no evidence that Respondent was dependent on alcohol or drugs or was of a pathological personality state. The therapist stated that he saw no value in or basis for treating Respondent at that time.

7. Respondent petitioned the Board to modify the terms of his Consent Order requiring him to attend therapy in light of the letter from the therapist.

8. Respondent notified the Board that since he did not have a therapist he would notify Judith A. Griffth, Board compliance officer, if he would be traveling out of Baltimore.

9. The Board did not reply to Respondent's petition for modification of the Consent Order, nor did the Board approve of Respondent's ceasing therapy, or approve his notifying Ms. Griffith.

10. The Respondent took no vacation from the date of the Consent Order, February 27, 1989 and reported for all drug-testing sessions until December 4, 1989.

11. After December 4, 1989, the Respondent established a procedure whereby his immediate supervisor, Dr. Levine, who gave permission for absence to all other residents, would also give permission to the Respondent to travel outside Baltimore. This procedure was not cleared with the Board.

12. Respondent did not respond to being called to give a urine screen on the following dates: 12/04/89, 12/06/89, 12/08/89, 12/12/89, 12/13/89, 12/14/89, 12/18/89, 12/19/89, 12/21/89, 12/26/89, 01/08/90, 01/10/90, 01/16/90, 01/19/90, 01/22/90, 01/24/90, 01/26/90, 01/31/90, 02/15/90, or 02/26/90. In the majority of instances of no response, Respondent has identified his location and activity as being on vacation.

13. In the remaining instances, there is no evidence of Respondent's location and activity.

14. An inference to where Respondent was during these times can be drawn in the negative, i.e., that Respondent avoided answering the beeper because he wished to avoid drug detection or in the positive, that the call was not received because the beeper battery may have been weak, Mr. Jones may not have been available, the beeper may have been shielded, the Respondent may have been out of range, or Mr. Jones may have dialed the wrong number.

Conclusions of Law

Based on a preponderance of evidence, the Board finds that Respondent violated the Consent Order of February 27, 1989, Condition #3, by failing to respond to a call to submit urine screens without written permission as required and approved by the Board.

Addendum

The Board has considered Respondent's exception dated August 7, 1990 to the administrative law judge's proposed Findings of Fact, Conclusions of Law, and Recommendation, which was written as a letter to the Board. (The State filed no exceptions but did present argument). This letter of three pages excepts to only one Finding of Fact. Respondent states:

> I have thoroughly read Mr. Fowler's summary of evidence and findings of fact and have no difficulty accepting what he has written other than it being Demerol and not Percocet that was detected in a urine screen in November 1988. What does have me incredibly concerned, as would be expected, is his recommended disposition.[3]

[3]The administative law judge's recommended disposition was revocation.

The Board also considered the arguments made by Respondent and the State. The Board accepts Respondent's exception to the recommended sanction and will permit Respondent to continue to practice medicine as an unlicensed individual.

The administrative law judge recommended that Respondent's registration be revoked based on Respondent's violating the Consent Order and Respondent's recalcitrant attitude. The Board agrees that Respondent did violate the Consent by not submitting to urine screens. An inference can be drawn, as the State so deftly argued, that Respondent did not respond to the calls because he wanted to avoid detection. However, there is no definitive proof that this was the reason. This fact, together with the fact there is no evidence of incompetence (though the most recent evaluation of Respondent was not as strong as those in the past), and the knowledge that the Board could fashion an Order which amply protects the public, while obtaining conclusive proof whether Respondent is addicted to drugs, made the Board decide not to impose the most severe sanction. However, the Board is adamant that even the slightest deviation from this Order will result in a lifting of the stay of revocation and in concluding that Respondent is addicted to drugs.

Order

Based on the foregoing Findings of Fact and Conclusions of Law, it is hereby, this 24th day of September, 1990, by a majority vote of those members of the Board considering this case:

ORDERED that Respondent's registration to practice medicine as an unlicensed practitioner at UMMS under Health Occupations Article §14-302, is hereby REVOKED; and be it further

ORDERED that said revocation is immediately STAYED and Respondent is placed on PROBATION and SHALL comply with the following conditions:

1. Respondent shall have urine tests three times a week, Monday at 8:00 a.m., Wednesday at 8:00 a.m. and Friday at 4:00 p.m. for eighteen months. The urine tests shall be carried out under the terms of the Protocol. Respondent shall pay the cost of those tests.

2. Respondent shall pay the costs of all urine tests, the results of which were submitted to the Board from July 1, 1989 until the present. These costs shall be paid within eighteen months of the effective date of this Order.

3. Respondent must notify the Board in writing by certified mail at least two weeks in advance of leaving Baltimore, if his absence would prevent him from submitting the scheduled urine screens. Respondent must obtain the Board's approval prior to leaving. No approval will be granted for travel outside the continental United States. Respondent must arrange to have urine testing performed when he is outside of Baltimore at a facility approved by the Board. In the event of an emergency, Respondent must contact Israel H. Weiner MD, Chairperson of the Board; J. Michael Compton, Acting Executive Director; or Margaret T. Anzalone, Deputy Director, by telephone prior to leaving. Upon request, Respondent will receive the business numbers and home numbers of these individuals.

4. Respondent must notify the Board, in writing, within one week of any change of his mailing address.

5. Respondent shall inform his immediate supervisor in any residency program or any other employment which he undertakes during the time in which this Consent Order is in effect of the existence of the Consent Order and its terms. Respondent shall execute a release to the Board permitting the Board to obtain from any such supervisor, performance reports concerning Respondent's job performance on a quarterly basis. Respondent shall arrange for his supervisor to confirm in writing to the Board that the supervisor has read this Order and understands Respondent's obligations under this Order.

6. Respondent shall only administer Schedule II narcotics intravenously if the administration is witnessed by another healthcare professional. The witnessing of the administration of intravenous Schedule II narcotics shall be noted in the chart of the patient to whom the narcotic is administered.

7. When administering a Schedule II narcotic to a patient in any dose, Respondent shall document in the patient's chart the reason that the narcotic is being administered in the dose and at the interval that it is administered.

8. If, in the course of his employment as a resident physician, Respondent finds that he is treating a patient who is addicted to narcotics, Respondent will attempt to initiate a drug intervention treatment program for that patient by contacting, either verbally or in writing, any drug abuse intervention program or drug treatment program present at the hospital in which he is working. Respondent will inform the drug abuse intervention program or drug treatment program that the patient he is treating is addicted to narcotics so that drug treatment can be offered to that patient.

9. Respondent must give a copy of this Order to any person (institution, individual, association, partnership, or corporation) to whom Respondent applies for a position to practice medicine.

10. Respondent shall not possess, dispense, use, or provide to any person any controlled dangerous substance. However, this does not prohibit Respondent from prescribing controlled dangerous substances for individuals under Respondent's medical care. In the event that Respondent is given a prescription for a controlled dangerous substance by a physician or an allied health professional for a physical or mental problem, Respondent shall inform the health provider of the existence of this Order and its terms. Respondent shall sign a release permitting the health provider to forward to the Board, a copy of Respondent's medi-

cal records in which the reason for prescribing the controlled dangerous substance shall be documented; and be it further

ORDERED that in the event that Respondent leaves or is terminated from his present position at UMMS, Respondent must immediately notify the Board in writing. If Respondent leaves or is terminated from UMMS before the completion of these conditions of probation, the Respondent must petition the Board for modification of this Order. However, conditions 1, 2, 3, 4, 5 and 10 remain in effect; and be it further

ORDERED that if Respondent breaches any term of this Order, or if Respondent provides a urine specimen that tests positive, then the Board may immediately lift the stay of the revocation of Respondent's registration, without notice and an opportunity for a hearing, provided that Respondent is given notice of this action, the reasons for same, and an opportunity to be heard within thirty days after Respondent requests a hearing; and be it further

ORDERED that eighteen months after this Order has been executed, Respondent may petition the Board for reinstatement of his registration to practice medicine without any conditions whatsoever. In considering whether to reinstate Respondent's registration (or if applicable, grant Respondent a license), the Board shall consider whether Respondent has complied with all of the conditions of this Order, and if Respondent has satisfactory evaluations from Respondent's supervisor; and be it further

ORDERED that the Consent Order of February 27, 1989, is hereby VACATED; and be it further

ORDERED that this Order is a Formal Order resulting from a disciplinary proceeding and as such is considered a public document pursuant to State Government Article, Annotated Code of Maryland, §10-617(h), and Health Occupations Article (HO) §14-510-.1.

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

Exhibit A

In The Matter of
Jeffrey Schimandle MD
Before the Maryland Board of
Physician Quality Assurance

Consent Order
Background and Findings of Fact

On June 21, 1988, after reviewing certain information which came to the attention of the Commission on Medical Discipline of Maryland, that body, pursuant to its authority under the State Government Article, §10-405(b), Annotated Code of Maryland, summarily suspended the registration of Respondent, Jeffrey Schimandle MD to practice medicine in the State of Maryland. On August 22, 1988, pursuant to an agreement reached between Respondent and the Board of Physician Quality Assurance, successor to the Commission on Medical Discipline, (the Board), and prior to any hearing or other disposition of the Emergency Order summarily suspending the registration, the Board and Respondent entered into a Consent Order by which the prior Emergency Order was vacated and Respondent's registration to practice medicine in the State of Maryland was reinstated subject to certain conditions.

On or about November 16, 1988, having received certain information indicating that a violation of one of the conditions of the August 22, 1988 Consent Order had occurred, the Board summarily suspended the registration of Respondent to practice medicine in the State of Maryland and issued certain charges against him. Prior to any hearing of disposition of the Board's November 16, 1988 Emergency Order summarily suspending Respondent's registration to practice medicine in Maryland and prior to any hearing or disposition upon any charges made by the Board against Respondent, Respondent and his counsel met with certain members of the Board to discuss informally the emergency suspension and charges related thereto in an attempt to resolve the matter by agreement of the parties.

As a result of the aforementioned informal discussions held between the parties, the Board has determined as a finding of fact that Respondent admits that he violated a condition of the August 22, 1988 Consent Order, namely, that on or about November 5, 1988, Respondent ingested one 75 mg tablet of Demerol.

On the basis of the information received, reviewed, and discussed concerning Respondent, it has been agreed by and between the parties that the Emergency Suspension of November 16, 1988 will be vacated and that the parties will enter into this Consent Order, the terms of conditions of which are listed below.

Order

It is hereby ORDERED this 27th day of February, 1989, by the Board of Physician Quality Assurance that the Emergency Order of November 16, 1988 is hereby VACATED and that Respondent's ability to become registered to practice medicine in a postgraduate training program in the State of Maryland is hereby REINSTATED subject to the following conditions of probation:

1. For a period of three years beginning on the date on which this Consent Order is executed, Respondent shall attend weekly individual psychotherapy sessions with one of the three psychotherapists recommended in the January 27, 1989 report of Charles L. Whitfield MD. Respondent shall execute a release providing that records of psychotherapy may be provided to the Board so that attendance may be monitored.

2. For a period of one year occurring sometime during the three-year period immediately following execution of this Consent Order, Respondent shall participate in weekly general group therapy administered by one of the psychotherapists recommended in the January 24, 1989 report of Charles L. Whitfield, MD.

3. For a period of one year beginning on the date that this Consent Order is executed, Respondent shall provide random supervised urine samples for forensic screening including meperidine, at a minimum of three times per week. For a period of one year thereafter, Respondent shall provide random supervised urine samples for forensic screening for meperidine and normeperidine at a rate per week to be established by the Board hereafter. During the period of time after this Consent Order is executed, but before Respondent returns to work as a resident physician, Respondent will provide urine samples for screening by contacting the Resource Center by telephone as instructed by Dr. Whitfield. Once Respondent resumes work as a resident physician, he will provide the minimum of three urine samples per week based upon a protocol to be established by the Board. This protocol will require Respondent to be available by beeper to respond to calls made to him to provide urine samples and will further require that Respondent will provide a urine sample within two hours of the time that Respondent is notified and a request for a urine sample is made. All urine samples will be strictly supervised by a person or persons hereafter named by the Board to serve that function and all urine samples will be submitted to the supervising person or persons without Respondent having any contact with the sample once given.

4. The identification and handling of all urine specimens given by Respondent shall be made and carried out according to the chain of custody procedure established by Maryland Medical Laboratories. Each urine specimen given by Respondent will be obtained at the

place at which it has been given by a representative of Maryland Medical Laboratories within twenty-four (24) hours. Respondent shall not touch or handle any urine specimen given by him after it has been taken by the supervising person, nor shall he be responsible for the handling, transportation or delivery of any urine specimen given by him. Each urine sample will be tested for a urine drug screen, Forensic I, and shall be performed on the premises of Maryland Medical Laboratories.

5. A urine specimen that tests negative upon one drug screening test is a negative specimen. A urine specimen that tests positive upon one drug screening test shall be retested with a second, confirmatory test. If the second confirmatory test is negative, then the urine specimen is a negative specimen. If the second confirmatory test is positive, then the urine specimen is a positive specimen. If the laboratory fails to perform a second confirmatory test upon a urine specimen that has tested positive one time, then the urine specimen is a negative specimen.

6. Maryland Medical Laboratories will send the final result of each urine specimen drug-screening test to the Board as soon as possible, but not later than four days after the urine is tested. Upon receipt of the result, the Board will send a copy to Respondent. Respondent shall execute a release authorizing Maryland Medical Laboratories to release the tests to the Board.

7. The cost of all urine specimen drug-screening tests will be borne by the Board of Physician Quality Assurance.

8. If during the period in which this Consent Order is in effect, Respondent must travel outside of Baltimore for reasons related to his work, employment or future employment, or family matters, Respondent shall obtain written permission from his psychotherapist to be excused from obligatory urine specimens for the limited period of time that he will be traveling. Permission must be obtained in writing in advance of the time of travel and obligatory urine testing must be resumed as soon as the travel time has ended.

9. Respondent shall inform his immediate supervisor in any residency program or any other employment which he undertakes during the time in which this Consent Order is in effect of the existence of the Consent Order and its terms. Respondent shall provide a release to the Board permitting the Board to obtain from any such supervisor performance reports concerning Respondent's job performance on a quarterly basis.

10. Respondent shall request the psychotherapist in charge of his treatment to provide monthly reports to the Board during the first year of psychotherapy and quarterly reports thereafter during the time period in which this Consent Order is in effect. The psychotherapist shall confirm in writing to the Board his understanding of the responsibilities under this agreement.

11. Respondent shall only administer Schedule II narcotics intravenously if the administration is witnessed by another healthcare professional. The witnessing of the administration of intravenous Schedule II narcotics by Respondent shall be noted in the chart of the patient to whom the narcotic is administered.

12. When administering a Schedule II narcotic to a patient in any dose, Respondent shall document in the patient's chart the reason that the narcotic is being administered, and the reason that the narcotic is being administered in the dose and at the interval that it is administered.

13. If in the course of his employment as a resident physician, Respondent finds that he is treating a patient who is addicted to narcotics, Respondent will attempt to initiate a drug intervention treatment program for that patient by contacting, either verbally or in writing, any drug abuse intervention program or drug treatment program present at the hospital in which he is working. Respondent will inform the drug abuse intervention program or drug-treatment program that the patient he is treating is addicted to narcotics so that drug treatment can be offered to that patient.

14. For a period of three years beginning on the day that this Consent Order is executed, Respondent shall not possess, dispense, use or provide to any person any controlled dangerous substances. However, this does not prohibit Respondent from prescribing controlled dangerous substances for individuals under Respondent's medical care.

15. If Respondent provides a urine specimen that tests positive or fails to provide a urine specimen under the terms of this Consent Order, then the Board, pursuant to its authority under State Government Article, §10-405(b) Annotated Code of Maryland, WITHOUT PRIOR NOTICE AND AN OPPORTUNITY TO BE HEARD, may immediately reinstate the Emergency Order of November 16, 1988 with amendments, if necessary, summarily suspending Respondent's registration to practice medicine provided that Respondent is given notice of this action and an opportunity to be heard within thirty days after Respondent requests the hearing.

16. If Respondent breaches any of the terms of this Consent Order other than the terms requiring provision of urine specimens for testing, then the Board reserves its right pursuant to law to suspend and/or revoke Respondent's registration to practice medicine in the State of Maryland subject to prior notice and hearing.

17. If, three years after the day on which this Consent Order is executed, Respondent has complied with all of the terms of this Consent Order, the Board shall fully reinstate Respondent's registration to practice medicine in the State of Maryland without any restrictions or conditions.

18. Respondent shall apprise the Board of his place(s) of employment at all times during which this Consent Order is in effect and shall also advise the Board of any change of address during that period.

It is hereby ORDERED that the November 16, 1988 Emergency Order of the Maryland Board of Physician Quality Assurance suspending Respondent's registration to practice medicine on an emergency basis, shall be and hereby is IMMEDIATELY VACATED upon the effective date of this Order, that being the date on which the Board signs this Order and that this Consent Order shall be in full force and effect for a period of three years thereafter; and be it further

ORDERED that in the event that Respondent is found in violation of any condition of compliance contained herein, the Board may assess against Respondent the costs borne by the State for the urine screening of Respondent; and be it further

ORDERED that this is a final order and as such is considered a public document pursuant to State Government Article of the Annotated Code of Maryland, Section 10-611 *et seq* and Health Occupations Article, §14-510.1.

ISRAEL H. WEINER MD, Chairperson
Maryland Board of Physician Quality Assurance

Consent

By this Consent, I hereby accept and agree to be bound by the foregoing Order and its conditions and restrictions.

I acknowledge the validity of this Order and the legal authority of the Board of Physician Quality Assurance to issue and enforce this Order.

I acknowledge that by consent to this Order, I am waiving my right to challenge in court the legal authority of the Board of Physician Quality Assurance to take emergency and summary action against my registration to practice medicine in the State of Maryland.

I understand, having been informed by counsel, that by consenting to this Order, I am not waiving my right to challenge the substance and findings contained in the November 16, 1988 Order for Emergency Suspension of Right to Practice Medicine, should the November 16, 1988 Emergency Order be reinstated pursuant to the terms of this Consent Order.

I further acknowledge that the Order provides that the November 16, 1988 Emergency Order may be reinstated WITHOUT NOTICE AND AN OPPORTUNITY TO BE HEARD in the event that the Commission or Board receives notice that my urine specimen tested positive for the presence of controlled dangerous substances or that I have violated any of the conditions of this Order. I acknowledge that in the event that the November 16, 1988 Emergency Order is reinstated, I will be given notice and an opportunity to be heard within thirty days of my request for a hearing.

I sign and consent to this Order after having an opportunity to consult with counsel and with full understanding of the meaning of the terms of the Order.

JEFFREY H. SCHIMANDLE MD ■

If these are your Questions:

What is meant by impairment?
When considering self-disclosure,
what issues should be taken into account?
How will others react to my
self-disclosure?
Should I tell my colleagues?
What should I tell my patients?
What should I say on applications for
privileges, licensing, etc.?

The Physician Rehabilitation Committee Has the Answers

For a free copy of "To Disclose or Not to Disclose," a brochure of questions and answers on the topic of self-disclosure for the physician recovering from impairment or illness, published by the Physician Rehabilitation Committee of the Medical and Chirurgical Faculty of Maryland as a service to all Maryland physicians, members and non-members, write to Med Chi, Physician Rehabilitation Committee, 1211 Cathedral Street, Baltimore, MD 21201 or call (301) 539-0872 or in MD 800-492-1056.

Legal and Ethical Concerns of Your Medical Practice

This monthly digest will summarize the laws of the State of Maryland, as well as the guidelines, procedures, codes of cooperation, and policy statements of the Medical and Chirurgical Faculty. These laws and policies are being published to reflect recent areas of concern to physicians throughout the state. The Principles of Medical Ethics of the American Medical Association have been adopted as the ethical standards of the Medical and Chirurgical Faculty, and they govern the conduct of members in their relations to the public and to each other (Faculty Bylaws, Article XIII, Section 1). For more information, please refer to the Compendium of Laws, Regulations, Opinions and Policies Governing the Practice of Medicine in Maryland.

Drug Testing of Employees

Questions surrounding the testing of employees for drugs or alcohol addiction have arisen recently as employers try to control job and health-related costs associated with such addictions. A September 10, 1990 Attorney General opinion addressed two such questions (75 *Opinion of the Attorney General*, 1990 [Opinion No. 90-043, September 10, 1990]). Much of the information below is capsulized or taken verbatim from that opinion.

At issue in the opinion is the "job-related alcohol and controlled dangerous substances testing" statute which was originally passed in 1988 and amended as recently as 1990 in the Maryland General Assembly. That statute delineates procedures that are designed to ensure fair and accurate drug and alcohol testing under an employer-sponsored testing program. The statute neither encourages nor discourages testing. It simply prescribes procedures to be followed when an "employer requires any person to be tested for job-related reasons" (HG § 17.214.1(b)).

The Statute

Under HG §17-214.1(b)(1), an employer must have the specimen tested by a laboratory that holds a permit from the Laboratories Administration of the Department of Health and Mental Hygiene (DHMH) or, if the laboratory is located outside the State, is "certified or otherwise approved" under HG §17-214.1(e). This latter subsection provides that DHMH is to adopt regulations governing the certification of laboratories that conduct job-related drug and alcohol testing. The regulations require laboratory compliance with certain standards, and establish guidelines for accreditation for proficiency testing and for compliance with federal cutoff levels for positive testing; they also include procedures for annual recertification and inspection (See COMAR 10.10.01). An employer who requires an employee to be tested, must also inform the employee of the name and address of the laboratory that will perform the test, if the employee so requests (HG §17-214.1(b)(2)).

If the employee has been tested positive for the use or abuse of any drug or alcohol, the employer must, after confirmation of the test results, supply the employee with: (1) a copy of the test result; (2) a copy of the employer's written policy on drug or alcohol abuse; (3) if applicable, written notice of the employer's intent to take any disciplinary action; and (4) a statement or copy of the provisions of HG §17-214.1(d), which permit an employee to request independent testing of the same sample for verification of the test result. The notification must be delivered in person or by certified mail within thirty days from the date the test was performed (HG §17-214.1(e)).

Finally, HG §17-214.1(h)(1) requires that certain information be kept confidential:

> "Except as [required by certain federal laws on commercial motor vehicles], in the course of obtaining information for, or as a result of, conducting job-related alcohol or controlled dangerous substance testing for an employer under this section, a laboratory, a physician, including a physician retained by the employer, or any other person may not reveal to the employer information regarding:
> (i) The use of a nonprescription drug, excluding alcohol, that is not prohibited under the laws of the State; or
> (ii) The use of a medically prescribed drug, unless the person being tested is unable to establish that the drug was medically prescribed under the laws of the State."

Authority to Order Tests

The first question posed to the Attorney General was: "Who is authorized to order a drug test under the statute?" After reviewing the federal and state law governing this issue the Attorney General concluded:

> "Although a laboratory generally may analyze a specimen only upon order of a physician, this requirement does not apply to drug tests conducted for job-related reasons. An employer may contract directly with a laboratory for such testing."

In support of such a conclusion, the Attorney General related the following arguments:

> "Under Maryland law, as a general matter, only a physician, or someone acting under the authority of a physician, may order a laboratory test. Under the Maryland Medical Practice Act, the practice of medicine includes, in relevant part, the following:

> Diagnosing, healing, treating, preventing, prescribing for, or removing any physical, mental or emotional ailment or supposed ailment of an individual ...

... [T]hese general provisions, however, are framed with reference to laboratory testing as an outgrowth of the therapeutic relationship between physician and patient. None appears to contemplate the quite different circumstances of a workplace drug-testing program, under which testing is for 'job-related reasons' (HG §17-214.1(b)). And the one statute directly addressing workplace testing, HG §17-214.1, does *not* require that testing be ordered by a physician.

... [T]he pertinent statute omits such a requirement because it would make little sense, given the realities of job-related testing. For example, assuming no impediment from a collective bargaining agreement, a private sector employer is free to adopt a random-testing program for its employees. Surely no public policy objective would be served by having a physician engage in the ministerial act of signing testing requisitions for those employees selected at random to be tested. See generally, *Morris v. Prince George's County*, 319 Md. 597. 603-04, 573 A.2d 1346 (1990) (statutes are to be construed to achieve 'the legislative purpose, the general aim or policy, the ends to be accomplished, the evils to be redressed ...')."

Reporting of Results

The other set of questions posed to the Attorney General related to the reporting of results:

- How are the results communicated to the employer and by whom?
- Who is authorized to review the results and speak with employees or employee-applicants if a test is confirmed positive?
- Is a medical review officer required?

The Attorney General concluded:

> "A laboratory must ensure that positive results are screened before the laboratory reports them to the employer, so that information which may not be reported has been deleted. The screening must be done by a physician or other professional qualified to assess whether positive test results reflect permissible use of over-the-counter or prescription drugs. Maryland law does not require that the screening be done by a 'medical review officer,' which is a term in the guidelines of the federal drug-testing program referring to a physician specifically trained in substance abuse disorders who evaluates positive test results in light of an employee's medical background."

Conclusion

It is evident from the opinion that while the Attorney General feels that leeway may be allowed in ordering or requesting such tests, it is essential that all results be screened by a physician or an equally qualified professional. A copy of the entire opinion and the relevant statutes may be obtained by contacting the Faculty at (301) 539-0872 or 1-800-492-1056. Please feel free to write concerning your reactions to this opinion.

Information for Authors

Manuscripts may be sent to Editor, **MMJ**, 1211 Cathedral St., Baltimore, MD 21201. Articles are accepted for publication on the condition that they are contributed solely to this journal. Transmittal letters should designate one author as correspondent and include his/her address and telephone number. Manuscripts are reviewed by editorial board members and guest reviewers.

Specifications

Manuscripts must be original typed copy, double-spaced throughout (including text, case reports, legends, tables, and references) with pages numbered consecutively. Along with manuscripts, please send an IBM-compatible floppy disk, with the document entered in a Word Perfect, Multimate, or Wordstar program.

Include full name of author(s) with highest degree, academic and professional titles, affiliations, and any institutional or other credits.

Tables with brief descriptive titles are to be typed on separate sheets of paper and numbered. The Editor reserves the right to edit tables. Statistics must be consistent in both tables and text.

References are limited to those citations noted in the text and are to be typed double-spaced and numbered consecutively as they appear in text. The number of references generally is limited to 20 in major contributions and fewer in shorter articles. Personal communications and unpublished data should not be included.

Photographic material must be submitted as high-contrast glossy prints. Drawings and graphs must be of professional quality. Four or fewer illustrations should be adequate for a manuscript of 4 or 5 typed pages. Recognizable photos of patients are to be masked and should carry with them written permission for publication.

For more extensive information about preparing medical articles for publication, see the **Uniform Requirements for Manuscripts Submitted to Biomedical Journals** compiled by the International Committee on Medical Journal Editors (available through the **Annals of Internal Medicine**).

Permissions: When material is reproduced from other sources, full credit must be given to both the author and publisher, and written permission from these sources must be included when the material is submitted.

Copyright: Material published in **MMJ** is protected by copyright and may not be reproduced without the written permission of both the principal author and **MMJ**.

Dr. Osler and the Book and Journal Club of the Medical and Chirurgical Faculty of Maryland

Many readers are familiar with how Dr. William Osler (Figure) came to Baltimore and the Johns Hopkins University Medical School. However, not all are aware that upon arriving in Baltimore in 1889, one of Dr. Osler's first activities was to visit the Medical and Chirurgical Faculty and to look over the library. It is easy to imagine the dismay that a bibliophile like Osler must have felt upon learning that the Faculty did not even house the collection. Instead it had been shunted off to the basement of the Maryland Historical Society.[1,2] With this discovery fresh in his mind, Dr. Osler took it upon himself to contact the Faculty's President, Aaron Friedenwald, and offer to serve on the Library Committee. As Osler was already well-known to the Medical and Chirurgical Faculty's leaders as a result of his lecture the prior year on "medical licensure,"[1] his offer was readily, and wisely, accepted. Thus began a relationship between Osler and the Faculty that would continue throughout his tenure in Baltimore.

After serving on the Library Committee for several years, Osler suggested, and soon thereafter established, The Book and Journal Club (Table). This was an effort by Osler to create an atmosphere of genial discussion and scholarly exchange similar to that which he had enjoyed during his time in Philadelphia, and would later establish with even greater success in Oxford.[2] According to the Club's charter, the Book and Journal Club members were to meet over dinner to review the latest in medical research and to recommend new titles for the library collection, allowing Faculty members to have a say in shaping the library.[3] Since collection development in the Faculty library prior to this period had been haphazard at best, this was a welcome development.

Each meeting of the Club was followed invariably by that typical nineteenth century male gathering - a smoker - where Osler would hold the rapt attention of his fellow physicians as he discussed the importance of one of the classics in medical literature. However, the first official presentation on the history of medicine was not presented by Osler but by Dr. Robert Fletcher,

Figure - Dr. William Osler

John Shaw Billings' assistant at the Surgeon General's Library, who lectured on the plague of 1630 in Italy. Osler's first official presentation to the group was a review of his visit to Samuel Pepys' personal library and the medical titles in that collection.[3]

Over the course of the next thirteen years, the Club, under Osler's guidance, would undertake a wide variety of activities intended to improve the Faculty's image in the Maryland medical community. These efforts included fundraising among the general membership; encouraging the Faculty to seek out new members, particularly students; assisting the Faculty in planning the centennial celebration; and urging the Faculty to pay off its various leases with an eye toward purchasing a larger, more modern facility.

As the needs of the library were at the core of the group's creation, this area was not neglected. During the "Osler period," the Club secured the donation of the Friedenwald Room, subscribed to over forty separate foreign journal titles, acquired the Frick and Upton Scott Collections, added lights and heat to the Faculty Library (a sorely needed improvement), and hired the Faculty's first full-time librarian - Marcia Noyes. The members of the Book and Journal Club also voted to turn over a portion of their membership dues to the Library Committee for additional purchases.[3-5]

It is interesting, and typical of what we have come to know of Osler's character, that while he was in-

strumental in reestablishing the Library as the center of the Faculty's social and scholarly life, Osler would never serve as Chairperson of the Library Committee, though the position was offered to him several times while he was in Baltimore. When it came to the Library Committee, Osler seemed to prefer to work within the Committee, never commanding but nonetheless, exerting a good-natured leadership.

As in all Clubs, the members of the Book and Journal Club sometimes got bogged down during their meetings with smaller issues. An example is the February 19, 1902 meeting in which the topic was the appropriate usage of Latin and Greek in defining modern medical terms. The debate, which lasted two hours, was summed up by guest speaker, Achilles Rose MD of New York. Rose thought that older physicians were not fulfilling their obligation to instruct younger members of the profession in the appropriate terms for the many new discoveries and operations taking place. An ovariectomy, Rose claimed "meant a tariff on eggs and not the removal of the human ovary."[3]

In 1903, the Club had been active in the Faculty's publication of Cordell's *Medical Annals of Maryland*. Upon Osler's departure for Oxford in 1905, the Club decided to turn more of its attention to the Medical Faculty's history.

> The new policy of the Club will be, in addition to buying books and journals, to encourage some work along historical lines by members of the Faculty. To further this, three meetings have been arranged this season...Here is a splendid opportunity for members of the Faculty to work up the lives of the old Maryland physicians, which few of us now realize were so potent in the medicine of their day, and as such should be brought to light now.[6]

At about this time, the Club began to feel the pinch of financial problems that had been developing slowly over the past few years. Nothing so drastic that it would force the Club to disband but it did force members to review their spending habits. Club members decided that they now could only afford to have after-dinner "smokers" on special occasions. However, they neglected to define just what would constitute a special occasion, and from later invitations it would appear that there were plenty of special occasions!

Upon Osler's death in 1919, the Club voted to rename their annual donation of Club dues to the Faculty Library as the "Osler Testimonial Fund." This gesture would prove to be short-lived however, as the money problems which had first appeared in the late 1890s continued to plague the group. By 1922, the Club was petitioning to become a regular committee of the Faculty in order to defray some of its operating costs. More importantly, in 1925 the Club members agreed to stop selecting and purchasing materials for the Library, turning both selection and the "Osler Testimonial Fund" over to the control of the Library Committee.[7]

The Book and Journal Club's petition to the Faculty Executive Board was approved that year, allowing the group to continue for another twenty years as a regular committee of the Medical and Chirurgical Faculty. In 1928, the Committee voted to again honor their Founder by changing the name to the Osler History Club (some invitations and announcements identify the group as the Osler History Society - the terminology was not consistent), becoming one of the earlier history of medicine groups to so honor the great physician. (The Mayo Foundation was one of the earliest, if not the first.[8]) Yet without Osler's direct influence, membership continued to ebb and flow during the final ten years of the Club's existence, never quite attaining the level of enthusiasm that the group had experienced under its Founder.

The group did enjoy one last burst of activity - starting in 1936 and lasting until 1941 - under the leadership of Alan Chesney and Louis Krause. However, issues greater than medical history were awaiting around the corner and the energy these two physicians possessed would shortly be redirected. In 1942, the Club voted not to meet for the duration of the war effort, an inevitable decision as many Faculty members were already enlisted or involved in the war effort. This decision proved to be the death blow for the Club, as physicians returning home from the war had little time or interest to devote to the Faculty or to its committees; except for the occasional special meeting, the Club had ceased to exist.[9]

Sir William Osler's influence on the study and collection of medical history through the Book and Journal Club has long been recognized at the national/international level. Just a few of the former club members who would leave their mark in the field were William Welch, Henry Barton Jacobs, Harvey Cushing, Alan Chesney, Eugene Cordell, Harry Friedenwald, John Ruhrah, and Louis Krause. While many of these physicians had discovered the value and joy of studying medicine's past prior to coming together in the Club, the friendships and the opportunity for the exchange of ideas and theories the Club provided, doubtlessly played a role in their later careers and, consequently, the entire field of the history of medicine.

In addition, many of the members of the Book and Journal Club/Osler History Club carried the ideals of Osler beyond the walls of the Medical and Chirurgical Faculty, becoming involved (along with Osler in some cases) in the creation of several other medical groups such as the Interurban Club and the Medical Library Association.

At the local level, Osler's involvement in the Book and Journal Club helped to breath new life into the Faculty. By participating in both the Library Committee and The Book and Journal Club, as well as serving as President of the Faculty, Osler helped to generate interest and enthusiasm for the Faculty's library, laying the foundation for the creation of a genuinely unique Maryland resource - a library collection that reflects not only the growth of medicine in Maryland but around the world. Physicians with a scholarly bent, like John Ruhrah, who wrote an unpublished biography of Osler, and Louis Krause would so thoroughly

absorb Osler's ideals that they would go on to leave their own legacy to the Medical and Chirurgical Faculty of Maryland in the form of books and monies for the Library's continued growth.

Where there's smoke...there may be bronchitis

"Recent research has delineated early, more subtle changes in lung and immune functions. These alterations directly predispose smokers to respiratory tract infection."

Am Fam Phys 1987;36:133-140

Ceclor® Pulvules® 250 mg
cefaclor

Established therapy for today's patients

For respiratory tract infections due to susceptible strains of indicated organisms

Brief Summary.
Consult the package literature for prescribing information.
Indication: Lower respiratory infections, including pneumonia, caused by *Streptococcus pneumoniae, Haemophilus influenzae,* and *Streptococcus pyogenes* (group A β-hemolytic streptococci).
Contraindication: Known allergy to cephalosporins.
Warnings: CECLOR SHOULD BE ADMINISTERED CAUTIOUSLY TO PENICILLIN-SENSITIVE PATIENTS. PENICILLINS AND CEPHALOSPORINS SHOW PARTIAL CROSS-ALLERGENICITY. POSSIBLE REACTIONS INCLUDE ANAPHYLAXIS.

Administer cautiously to allergic patients.

Pseudomembranous colitis has been reported with virtually all broad-spectrum antibiotics. It must be considered in differential diagnosis of antibiotic-associated diarrhea. Colon flora is altered by broad-spectrum antibiotic treatment, possibly resulting in antibiotic-associated colitis.

Precautions:
- Discontinue Ceclor in the event of allergic reactions to it.
- Prolonged use may result in overgrowth of nonsusceptible organisms.
- Positive direct Coombs' tests have been reported during treatment with cephalosporins.
- Ceclor should be administered with caution in the presence of markedly impaired renal function. Although dosage adjustments in moderate to severe renal impairment are usually not required, careful clinical observation and laboratory studies should be made.
- Broad-spectrum antibiotics should be prescribed with caution in individuals with a history of gastrointestinal disease, particularly colitis.
- Safety and effectiveness have not been determined in pregnancy, lactation, and infants less than one month old. Ceclor penetrates mother's milk. Exercise caution in prescribing for these patients.

Adverse Reactions: (percentage of patients)

Therapy-related adverse reactions are uncommon. Those reported include:
- Hypersensitivity reactions have been reported in about 1.5% of patients and include morbilliform eruptions (1 in 100). Pruritus, urticaria, and positive Coombs' tests each occur in less than 1 in 200 patients. Cases of **serum-sickness-like** reactions have been reported with the use of Ceclor. These are characterized by findings of erythema multiforme, rashes, and other skin manifestations accompanied by arthritis/arthralgia, with or without fever, and differ from classic serum sickness in that there is infrequently associated lymphadenopathy and proteinuria, no circulating immune complexes, and no evidence to date of sequelae of the reaction. While further investigation is ongoing, **serum-sickness-like** reactions appear to be due to hypersensitivity and more often occur during or following a second (or subsequent) course of therapy with Ceclor. Such reactions have been reported more frequently in children than in adults with an overall occurrence ranging from 1 in 200 (0.5%) in one focused trial to 2 in 8,346 (0.024%) in overall clinical trials (with an incidence in children in clinical trials of 0.055%) to 1 in 38,000 (0.003%) in spontaneous event reports. Signs and symptoms usually occur a few days after initiation of therapy and subside within a few days after cessation of therapy; occasionally these reactions have resulted in hospitalization, usually of short duration (median hospitalization = two to three days, based on postmarketing surveillance studies). In those requiring hospitalization, the symptoms have ranged from mild to severe at the time of admission with more of the severe reactions occurring in children. Antihistamines and glucocorticoids appear to enhance resolution of the signs and symptoms. No serious sequelae have been reported.
- Stevens-Johnson syndrome, toxic epidermal necrolysis, and anaphylaxis have been reported rarely. Anaphylaxis may be more common in patients with a history of penicillin allergy.
- Gastrointestinal (mostly diarrhea): 2.5%
- Symptoms of pseudomembranous colitis may appear either during or after antibiotic treatment.
- As with some penicillins and some other cephalosporins, transient hepatitis and cholestatic jaundice have been reported rarely.
- Rarely, reversible hyperactivity, nervousness, insomnia, confusion, hypertonia, dizziness, and somnolence have been reported.
- Other: eosinophilia, 2%; genital pruritus or vaginitis, less than 1% and, rarely, thrombocytopenia and reversible interstitial nephritis.

Abnormalities in laboratory results of uncertain etiology.
- Slight elevations in hepatic enzymes.
- Transient lymphocytosis, leukopenia, and, rarely, hemolytic anemia and reversible neutropenia.
- Rare reports of increased prothrombin time with or without clinical bleeding in patients receiving Ceclor and Coumadin concomitantly.
- Abnormal urinalysis; elevations in BUN or serum creatinine.
- Positive direct Coombs' test.
- False-positive tests for urinary glucose with Benedict's or Fehling's solution and Clinitest® tablets but not with Tes-Tape® (glucose enzymatic test strip, Lilly).

Gerald A. Glowacki MD was presented with the *Maryland Medical Journal's* (*MMJ*) Best Article Award during the Med Chi Semiannual meeting in September. His article, "Estrogen Replacement Therapy: Risk/Benefit Ratio for Treatment," was featured in the July 1989 issue of *MMJ*.

Dr. Glowacki is Chairman of the Department of Obstetrics and Gynecology at Franklin Square Hospital and is an assistant professor in the OB/GYN Department of Johns Hopkins Hospital.

After graduating from the Upstate Medical Center in Syracuse, New York, he became a Fellow of the American College of Obstetrics and Gynecology, and the American Fertility and Sterility Society.

A past president of the Baltimore County Medical Association (BCMA), the Maryland Obstetrical and Gynecological Society, and the Maryland Division of the American Cancer Society, Dr. Glowacki is active in several other organizations including the American Association of Gynecologic Laparoscopists, and the Gynecologic Laser Society of which he is a founding member.

Dr. Glowacki has published numerous articles in several other medical journals including the *Journal of Reproductive Medicine* and the *Journal of Gynecologic Surgery*. He is a member of the Editorial Board of *Gerontology and Geriatrics Education* and has served on the Editorial Board of *Laser Beam*. The *MMJ* Editorial Board congratulates Dr. Glowacki on his award.

H. Margaret Zassenhaus MD was officially invited by the President of the University of Hamburg, Germany, where she was appointed an Honorary Senator of the University of Hamburg; this honor has only been awarded twenty-eight times in the past forty years. This in only the most recent of many awards earned by Dr. Zassenhaus, an internist in Towson.

Knighted by both the King of Norway and the King of Denmark in the early 1960s, she was subsequently nominated by the Norwegian Government for the Nobel Peace Prize. Her autobiography, *Walls,* was chosen as "Best Book of the Year" by three organizations including The American Library Association. In addition, a documentary of her life and work, *It Mattered to Me,* aired on public television in 1985 and 1986.

In 1976, Dr. Zassenhaus was selected as "Outstanding Woman of the Year" in Baltimore County. Ten years later, she was inducted into the Maryland Women's Hall of Fame by Governor Harry Hughes. She is listed in *Who's Who in America, Who's Who of American Women,* and *Foremost Women of the Twentieth Century, England.*

In the past fifteen years, Dr. Zassenhaus, a member of the staff of the Greater Baltimore Medical Center, has received honorary degrees from Goucher College, Towson State University, Notre Dame College of Maryland, Washington College of Maryland, and the University of Maryland - College Park.

A member of the Maryland Humanities Council, Dr. Zassenhaus spends countless hours each year evaluating applications for grants for furthering the cultural life in the public sector.

■ ■ ■

On October 4, 1990, *Marcel Salive MD, MPH,* an epidemiologist with the National Institute on Aging, was named the 1990 recipient of the Jay S. Drotman Award of the American Public Health Association. This award honors a young healthcare worker who demonstrates potential in the health field by challenging traditional public health policy or practice in a creative and positive manner.

As part of his residency in Preventive Medicine at Johns Hopkins, Dr. Salive wrote a petition for an occupational health standard and a press guide to the Health Care Financing Administration (HCFA) Mortality Release. Working within the U.S. Office of Disease Prevention and Health Promotion, he drafted national standards for clinical preventive services on screening for suicidal intent and counseling on sexually transmitted diseases. While affiliated with the National Center for Health Services Research, he was one of the developers of the Medical Treatment Effectiveness Program, a research program on outcomes and effectiveness of healthcare aimed at providing a scientific base for improved clinical practice. ■

Pain is Inevitable, Suffering, can be Optional

Partners in Healthcare

As a private practitioner, you want assurances that a nursing home can—and will—provide quality medical care for your patients. And you want assurances that such care will be provided in an atmosphere of cooperation and respect.

Meridian Healthcare, with its 18 Maryland homes, works with the medical community to provide just such assurances. Including IV care and other sub-acute services available at our Multi-Medical facility. Meridian continues its commitment to develop models of care for the Alzheimer's patient in consultation with The Johns Hopkins Medical Institutions. Or specialized in-house rehabilitation programs, including occupational and physical therapy, and speech/language pathology services available at *all* our nursing centers. And special services like short-term or respite care, our own pharmacy, pet therapy, art classes, gourmet night, outings, and a host of programs to maximize independence. Then there's our full-time activity directors, social workers, and dieticians—all of whom are specialists in geriatric care.

Each one of our 18 Meridian Nursing Centers is dedicated to supporting you and your treatment regime, making it as easy as possible for you to aid your patients and their families. Experience the Meridian difference today.

Call 296-1000 for the facilities in your practice area.

Meridian Nursing Centers—
The Professional Choice.

THE JOHNS HOPKINS MEDICAL INSTITUTIONS

All courses at the Turner Auditorium unless otherwise indicated. For information on sponsored Continued Education Activities for 1990-1991, contact the Office of Continuing Education, 720 Rutland Ave., Turner Auditorium, Baltimore, MD 21205 (301-955-5880).

January 31 - February 1, 1991

Long-term Care of the Elderly: 18th Annual Johns Hopkins/Mason F. Lord Geriatrics Symposium Fee: $200 physicians; $150 allied health professionals. Credits to be determined. Info: 955-2959.

February-April 1991

32nd Postgraduate Institute for Pathologists in Clinical Cytopathology for Board Certified (or qualified) pathologists as a subspecialty residency. 152 AMA Cat I credits in two courses, both of which must be taken. Application and preregistration are advised ASAP; preregistration must be completed before March 15, 1991 unless by special arrangement. Info: J. Frost MD or B. Remley, 111 Pathology Building, The Johns Hopkins Hospital, Baltimore, MD 21205 USA (301-955-8594). *The entire course is given in English.*

February-April Home Study Course A, personal reading and microscopic study at own lab in preparation for Course B. Course A materials will be sent to each participant within the U.S. and Canada for home study. Participants *outside* the U.S. and Canada must make arrangements to study Course A before Course B.

April 14-April 25 In-residence Course B, lecture series, laboratory, and clinical experience at the Johns Hopkins Medical Institutions, Baltimore.

March 14-16, 1991

Brain Chemistry and Behavior: Advances in PET and SPECT Imaging Fee: $440 physicians; $340 residents. 18 AMA Cat I credits. Info: Patty Campbell 301-955-3839 or Julia Buchanan 301-955-8582.

March 18-20, 1991

Spectrum of Developmental Disabilities: Cerebral Palsy - Clinical and Research Issues Fee: $425. 20 AMA Cat I credits. Info: 301-955-2959.

March 21-22, 1991

Clinical Care of the Patient with HIV Infection Fee: $300 physicians; $150 residents. 14 AMA Cat I credits. Info: 301-955-2959.

Continuously Throughout the Year

Visiting Preceptorship in Pediatric Critical Care Medicine Ongoing 5-day preceptorship by appointment. Fee: $600. 40 AMA Cat 1 credits. Info: 955-2959.

Ophthalmic Electrophysiology Technician Training Course Ongoing 1-week course by appointment. The Wilmer Eye Institute, Baltimore. Info: C. Kearney 301-955-2959.

The Department of Radiology and Radiological Sciences offers several courses in abdominal and obstetrical ultrasound. Info: P. Williams 301-955-3169.

Visiting Physicians - offered throughout the year for experience in the lab and participation in read-in sessions; by appointment only. Fee: $500. 40 AMA Cat I credits.

Johns Hopkins Medical Grand Rounds - Accredited audiovisual continuing education series of case discussions for clinicians; 30 topics/year in 5 bimonthly programs. Individual and group subscriptions. 40 AMA Cat I credits. Info: 301-955-3988.

Microsurgery Training at The Johns Hopkins Hospital, one week program offered continuously throughout the year. 40 AMA Cat I credits. Info: P. Williams 301-955-3169.

Baltimore St., Baltimore, MD 21201 (301-328-3956) or by calling the phone number listed under a specific program. FAX 301-328-3103.

December 7

Advances in Surgery for Infants and Children, The University Club, UMAB campus. Fee: $75. 6.5 AMA Cat I credits.

December 7-8

Culture, Economics and Cancer: Models for Intervention, Stouffer Harborplace Hotel, Baltimore. Fee and credits to be determined. Info: Sharon Stenhouse 301-328-3956.

January 24, 1991

Dean's Conference Number 3: Pediatric Infectious Disease and Immunology for the Practicing Clinician, UMAB campus, Medical School Teaching Facility, Baltimore. Fee: $35 (part of the $120 for 4 conferences). 6 AMA Cat I credits.

February 21, 1991

Dean's Conference Number 4: Medical Advances for the 21st Century, UMAB Campus, Medical School Teaching Facility. Fee: $35 (part of the $120 for 4 conferences). 6 AMA Cat I credits.

March 13-15, 1991

6th National Traumatic Brain Injury Symposium, sponsored by the Maryland Institute for Emergency Medical Services Systems, UMAB campus. Fee: $199. Info: Roberta Schwartz 301-328-6101/2478.

March 21, 1991

Dean's Conference Number 5: Health Issues for Men and Women, UMAB Campus, Medical School Teaching Facility. Fee: $35 (part of the $120 for 4 conferences). 6 AMA Cat I credits.

March 21-23, 1991

13th Annual Trauma Symposium, Convention Center, Baltimore. Fee: $395 before February 22; then, $425. Credits to be determined. Info: Kimberly Unitas 301-328-2399.

Continuously Throughout the Year

University of Maryland Dean's Conferences - Held monthly, October through April. Designed for the Family/General Practitioner and Internist. Each conference highlights different clinical departments placing emphasis on the practical methods being used and researched at the University of Maryland. Extension programs are being planned to complement the programs held on the University's Baltimore campus.

Visiting Professor Program - A new 1990-1991 directory of speakers and their topics is available for area hospitals and other healthcare organizations. No administrative fee for this service. Info: 301-328-3956.

Visiting Practitioner Preceptorships - Opportunities for physicians to participate in clinical situations in the University of Maryland Medical Systems. Requires approval from clinical department/division heads. Hour-for-hour Cat I credits available. Direct all inquiries to CME 301-328-3956.

Departmental Rounds and Conferences - Weekly, hands-on and lecture presentations hosted by the University's clinical departments. Hour-for-hour AMA Cat I credits available. Brochure available.

Advanced Trauma Life Support Provider/Instructor Programs sponsored by University of Maryland/MIEMSS. Info: M. Nelson 301-328-2919.

December 6-7 Provider

MISCELLANEOUS MEETINGS

December 7

The Middle Adult Years - Crisis or Opportunity, sponsored by the Psychiatric Institute Foundation, Hyatt Regency Hotel, Bethesda, MD. Fee: $135; $99 students and clergy. 5 AMA Cat 1 credits. Info: Audrey Cannamela 202-965-8450.

January 19, 1991

Issues of the Spine and Vascular Disease Update, sponsored by the Maryland Academy of Family Physicians, Stouffer Harborplace Hotel, Baltimore. Fee: $50 MFAP members; $75 nonmembers; No charge for residents and medical students. 6 AMA Cat I credits; 6 AAFP prescribed hours. Info: Lee E. Gresser MD 301-747-1980.

March 16, 1991

Technology Update for the Family Physician, sponsored by the Maryland Academy of Family Physicians, Loews Annapolis Hotel, Annapolis, MD. Fee: $50 MAFP members; $75 nonmembers; no charge for residents and medical students. 5 AMA Cat I credits, 5 AAFP prescribed hours. Info: William P. Jones MD 301-747-1980.

Your Day in Annapolis

DOCTOR OF THE DAY

Each year since 1964, *the Medical and Chirurgical Faculty* and its physician members staff the first aid facility at the state capitol during the General Assembly Session. This is made possible through the generous donation of one day of **your** time to serve in the first aid room located in the State House in Annapolis.

The first aid facility is open to legislators, their staffs and the public for the 90-day session. A registered nurse is on duty during this time. It is very important, however, that we provide a **"Doctor of the Day"** *each and every day* of the legislative session. As the Doctor of the Day, you are provided an opportunity to see firsthand the workings of the Maryland State Legislature while staffing the first aid facility.

Please take a moment to check your calendar and determine if you are able to donate a day of your time to the first aid facility in Annapolis. Preceding is a post card indicating the dates of the 1991 Legislative Session. Please fill out and return the card to Med Chi if you are able to serve. You will receive a confirmation card and then later a letter explaining when and where to report. (Please note, all Monday dates are *evening sessions* - beginning at 4:00 p.m. and ending at 9:00 p.m.)

Thank you for your interest and willingness to participate in this unique and valuable experience. For more information, call Berndette La Rue at Med Chi's Legal Department, 301-539-0872 or toll free in MD at 1-800-492-1056.

Maryland's 1991 Legislative Session
January 9 - April 8, 1991

The Dual Diagnosis Treatment Program of Sheppard Pratt

Patients with psychiatric illness and drug or alcohol problems present complex diagnostic and treatment challenges.

Sheppard Pratt's inpatient units are designed and staffed specifically for the treatment of these complicated patients.

We provide:

- ☐ Comprehensive psychiatric and chemical dependence evaluation;
- ☐ Specialized programs for patients with affective disorders, anxiety disorders, schizophrenia and learning disorders;
- ☐ Psychopharmacological evaluation and treatment;
- ☐ Specialized programming for the gerontological patient who is chemically dependent;
- ☐ Addiction education for the psychiatric patient who is resistant to treatment for chemical dependence; and
- ☐ On site Double Trouble, AA and NA meetings.

Founded in 1853, Sheppard Pratt is a 322-bed private, not-for-profit psychiatric hospital that provides comprehensive diagnostic and treatment services for short, intermediate or long term patients as well as outpatient and partial hospitalization care.

For more information about Sheppard Pratt's approach to the dually diagnosed patient, or to make a referral, contact the Adult Admissions Office at:

(301) 938-3800
6501 North Charles Street
Baltimore, Maryland 21285-5815

▪ *Sheppard Pratt*
A not-for-profit health system

WE KEEP THE STANDARDS UP.

Founded during the medical liability insurance crisis of 1975, P.I.E. Mutual Insurance Company has consistently offered quality insurance programs and services at very competitive rates.

What's the catch? Quality. P.I.E. Mutual is a physician-owned underwriter dedicated to maintaining a high level of quality among the physicians we serve. This includes:

Physician Managing Boards, established in each region of operation to provide input on two important functions:

1. review of new applicants.
2. review of claims.

Quality Rated Insurance Program: a modified claims-made plan which works in the physician's favor to reward loss-free physicians and provides added protection not available in other policies.

A Financially Sound Reinsurance Program with Lloyd's of London, the world's most prestigious reinsurer.

An Aggressive Defense Team, experienced in all types of medical liability claims and willing to fight for your cause.

If your standards match ours, let's talk business.

THE P•I•E MUTUAL

INSURANCE COMPANY

SO WE CAN HOLD THE PREMIUMS DOWN.

MRI UPDATE

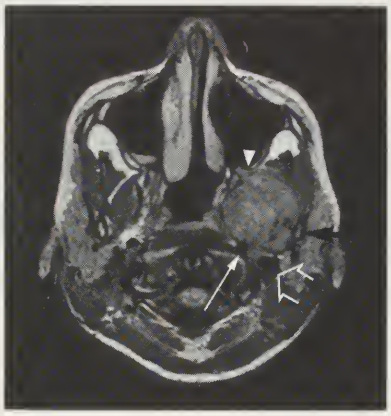

Figure 1

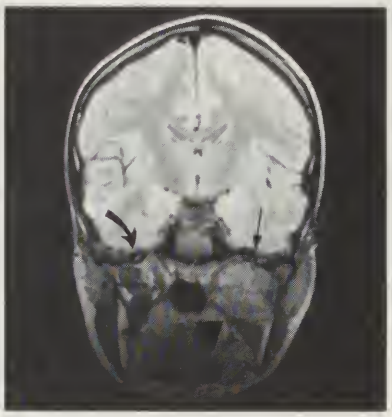

Figure 2

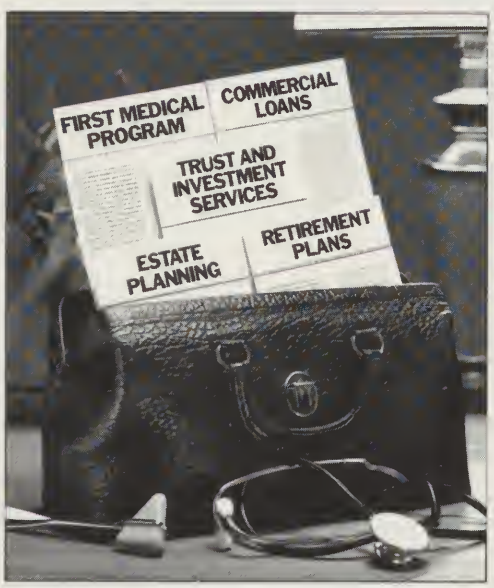
CLINICAL INFORMATION: This is a 14-year-old male with headache and left jaw pain.

FINDINGS: The axial image (figure 1) demonstrates a 4 cm. mass centered in the left parapharyngeal space. It deforms the left nasopharyngeal wall, but the fat plane between the nasopharyngeal wall and the mass indicates that the mass did not arise from epithelium there. The mass extends anteriorly through the pterygopalatine fossa to abut the posterior wall of the maxillary sinus (arrowhead), but it does not appear to invade the sinus. The mass extends laterally adjacent to the neck of the mandibular condyle (large arrow). It is separated from the deep lobe of the parotid by the deep branch of the facial artery. The mass is separated by fat from the internal jugular vein (open arrow). It abuts, but does not encase the internal carotid artery (long arrow). The coronal image (figure 2) demonstrates the mass effect of this large lesion (large arrow). Though the mass lies adjacent to the foramen ovale (small arrow) and appears to engulf an exiting branch of the mandibular nerve, it does not extend intracranially. The mandibular division of the fifth nerve lying just above the foramen ovale is shown on the normal right side (curved arrow).

COMMENT: MRI clearly demonstrates the size and extent of the mass in this difficult location. CT does not provide the multiplanar capability and soft tissue detail afforded by MRI which provides complete presurgical staging and analysis. The differential diagnostic possibilities must include juvenile angiofibroma because of the patient's age and sex. Paraganglioma and schwannoma were also considered possibilities. Mixed tumor arising from the deep lobe of the parotid could produce this appearance, but the lesion appeared to be separate from the deep lobe. The biopsy diagnosis was "sarcoma". Rhabdomyosarcoma in this area more commonly occurs in younger children.

Maryland Magnetic Imaging
900 Toll House Avenue
Frederick, MD 21701
(301) 662-0077



Health Images facilities operate their MRI systems with all available upgrades including contiguous thin slices, high resolution head and body coils, state of the art surface coils, and cardiac gating.

Health Images facilities are a community resource available to all area physicians.

Why buy an office automation system that doesn't offer a long-term solution?

ACCLAIM™ from Sentient is the total system solution.

A lot of medical practices are planning to invest in an office automation system. But a lot of the systems out there just don't offer the comprehensive functions and long-term expandability that your practice may need.

IBM® and compatible hardware.

The ACCLAIM system operates on IBM and compatible hardware, so you know you're getting the quality standard of the industry. And it's completely expandable, so it can grow as your practice grows.

Long-term support.

ACCLAIM is the system solution that fits your needs today. And Sentient's software engineers, customer trainers, and telephone support people are always there to make sure your system fits your needs over the years to come.

Easy to operate.

Even if your staff has no previous computer experience, ACCLAIM is simple to operate effectively and efficiently. Complete training is included in the purchase.

When you're thinking about office automation, call Sentient first, and find out what ACCLAIM can do for you.
